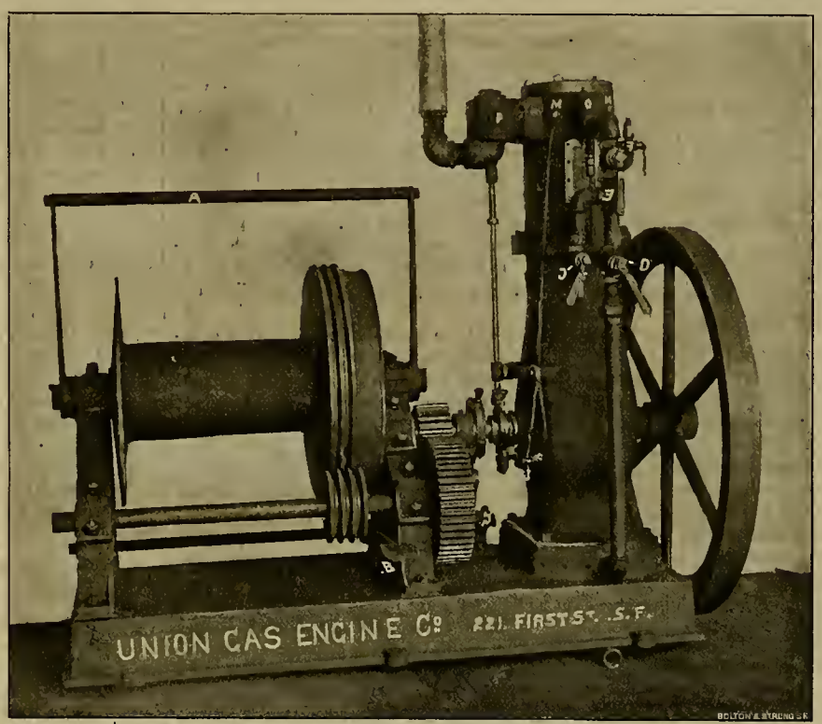
Improvements at the North End.

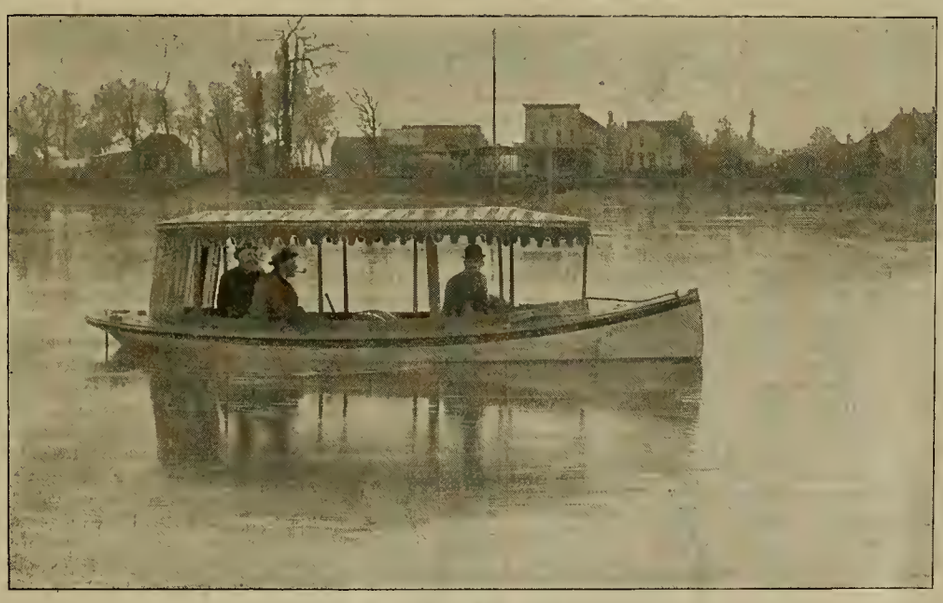
The work which has been commenced by ex-Senator James G Fair on his extensive property on the bay shore between Black Point and the Presidio marks an era in the progress of this city. That section of the city has heretofore been entirely neglected, yet it fronts on deep water and is splendidly adapted for manufacturing purposes. The Fulton Engineering and Shipbuilding Works have already been established there and other industrial establishments will doubtless follow when the sites are prepared. Last week Senator Fair awarded a contract to Warren & Malley for the grading, filling in, etc., of 2,500,000 cubic yards of sand in that section of North Beach between Webster and Baker streets. The contract was for $300,000. It is estimated that the contractors will move 5000 yards—about 5000 cartloads—a day, and will employ 200 men. It will require two years to remove the sand. The plans of ex-Senator Fair in this enterprise involve the expenditure of $3,000,000, and this vast outlay of money will give some idea of the magnitude and importance of the work. The letting of the above contract and others necessary for the completion of the work will give employment to quite an army of deserving laboring men greatly in need of work. It is refreshing to see one of our greatest capitalists spend his money freely in a direction like this, rather than loan it out at cent per cent as is too much the custom in this city. Of course ex-Senator Fair expects to make money out of this investment either in sales or leases of the land, but he must disburse a large amount before any return can be expected.

The foundry and other large industrial establishments needing a water frontage have been unable to obtain it within the present improved limits of the city. The Union Iron Works, Pacific Rolling Mills, sugar refinery and dry dock already have the available points to the south, but over at North Beach there is a wide stretch of unused territory which can readily be improved. It is on part of this that Senator Fair is at work. In time the seawall will be extended out to this section, and the belt railroad be operated also. Then the factories, etc., will have both water and rail communication. Moreover, they can obtain very large tracts suitable for manufacturing purposes, instead of being crowded up in the more thickly settled portions of the city. The whole northern and western beach of San Francisco has a great future, and Senator Fair's example will doubtless be followed by other property owners who own land in that part of the city.

"ARRASTRE" JOHNSON has a bond on a black sand gold mine out at the ocean beach, but it is not the mine being operated by "Prof." William Patterson. Johnson has a new machine for working black sand for which a patent has been allowed, and he intends trying it out at the beach on the mine he has bonded.



HOISTING PLANT WITH GAS ENGINE.



UNION GAS ENGINE LAUNCH.

Gas Engines for Hoists and Launches.

The use of "vapor" engines is very largely increasing in these days, for, while at first mainly applied for marine purposes, it has been found that there is a wider range for them ashore. The Union Gas Engine Co. of this city manufactures a vapor engine so simple that it requires no skilled mechanic or engineer to operate it. The efficiency is such that the engine can be used in any place or for any purpose where power is required, for it needs neither fire, boiler, pumps nor other appliances that are of necessity used with steam engines. The mechanism is such that but a moment is required in which to start it. There is no smoke, dirt nor ashes, no steam or water gauge to watch, and no irregularity of motion. These engines are made from one to fifteen horse-power.

Among other purposes to which this engine has been adapted is for hoisting from mines, etc. One of the engravings on this page shows a four-horse power engine and hoisting gear, all on one bed ready for use. For small mines such a rig as this is very convenient indeed. The fuel is cheap and easily transported. No wood, coal or water are needed. The big boiler of the usual steam engine is entirely dispensed with. A number of machines of this type have been put in use in this State recently. This month a complete outfit for J. F. Cowdery was shipped to his mine in Sierra county, consisting of a double drum hoist and six-horse power Union engine. An actual working test made before shipment proved very satisfactory to the purchaser.

A number of vapor launches with these engines are plying in the bay and rivers. A 22½-foot launch with three-horse power engine, and finished in the best style, has been built for the estate of H. J. Glenn, at Jacinto. An engraving of one of this type of launches is shown on this page. A "stern wheeler" for service on Eel river, Humboldt county, was built not long since, and she makes four knots an hour against the strong current. Some 300 gas-engine launches and boats have been built here. There is no infraction of the navigation laws in using these vessels, and they are free from the annoyances and expense attending government inspection of ordinary steam vessels. The county of Sacramento has placed an order for five engines, which are to be used for pumping water for sprinkling the roads, and Napa county has also ordered several for the same purposes. The use of these gas engines is constantly increasing.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Union Gas Engine Launch; Hoisting Plant with Gas Engine, 1.

EDITORIALS.—Improvements at the North End; Gas Engines for Hoists and Launches, 1. The Price of Silver and the Mining Interests; California's Chance, 2. Resumption of Hydraulic Mining; Boring Machinery for Prospecting Gravel Mines, 3.

MISCELLANEOUS.—Coast Industrial Notes, 3. Quicksilver Mining Suit Decision; Nevada Minerals at the Fair; Mines of Humbug, Siskiyou County; Washington Not Well Represented, 4. The Great Northern Railway; Working Ores in South Africa; Miscellaneous, 5. The California State Fair of 1893. An Ideal Nevada County Mining Town; What Supervisors Can Do With Game Laws; Miscellaneous, 5.

MECHANICAL PROGRESS.—The Duplex Process; Metal Ties; Naval Construction and Maintenance, 8.

SCIENTIFIC PROGRESS.—Electricity and Cholera; Scientific Education Invaluable; Contagiousness of Consumption; Miscellaneous, 8.

ELECTRICITY.—Economy of Small Lighting Stations; The Trolley in the Road; Electric and Steam Railroads, 10.

USEFUL INFORMATION.—Camels in Australia; Ways to Injure Health; Why a Cemetery is So Called; A Hammock Idea; Miscellaneous, 10.

MINING SUMMARY.—From the Various Counties of California, Nevada and other Pacific States and Territories, 13-14.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 16.

The Price of Silver and the Mining Interests.

The worst blow to the silver mining industry in this country which it has ever received came unexpectedly and from an unexpected source, in the announcement that the mints of India had ceased coining the white metal. That country has long been known as the greatest consumer of silver, yet the Indian Council has passed an order for the immediate closing of the Indian mints to the free coinage of silver. In the English House of Lords, Earl Kimberly, Secretary of State for India, made this announcement on Monday, and added that arrangements are being made to issue rupees from the mints in exchange for gold at the rate of 16d per rupee, and for receiving sovereigns and half-sovereigns at the treasuries in payment for dues at the same rate. He further said it was intended to introduce a gold standard in India, but that gold in the meantime would not be made the sole legal tender.

This news was almost paralyzing to the silver miners of this country and to all advocates of free silver coinage. Almost immediately the price of the metal fell to the lowest point ever before known. Merchants are petitioning the President to take steps toward the repeal of the Sherman silver bill, and it is probable that Congress will soon be convened to take action. Meantime the free coinage men have opened headquarters in Washington and will make a vigorous campaign. Governor McConnell, as President of the Trans-Mississippi Congress, has appointed Senators Teller of Colorado and Mitchell of Oregon to act with Senator Stewart of Nevada as a committee to present the free-coinage resolutions adopted by the congress to the United States Senate.

Aside from the financial and political features of the subject, those which relate to the mining of the metal interest our readers most. As might have been expected, such a disastrous drop in value as occurred immediately caused the closing down of a lot of mines, and more must follow. In Utah, on Tuesday, the Daily West mine at Park City was ordered closed down. The Diamond mine at Eureka, Nev., and the old Jordan and Galena at Bingham were also ordered closed. The owners of the following mines say that they will close in a few days: The Sampson at Bingham, the Bullion, the Beck and the Champion at Tintic, the Caroline at Eureka, the Yosemite at Bingham, the Crescent at Park City and the Anchor at Park City. These have all been steady and strong producers.

In Colorado, which is the largest producer of silver of any of the States, the decline in silver created the greatest apprehension. Davis H. Moffatt, the largest mine-owner in the State, said: "The situation is exceedingly grave. I have wired all my managers to come to Denver at once. Seventy-seven cents for silver mined by men who are paid $3 a day means a loss to the mine-owner. My idea is to propose to the men in my employ that instead of receiving $3 a day they they should be satisfied with two-thirds of that sum until silver shall return to a fairly reasonable price. If they do not accept such a proposition I shall be compelled to shut down all my property."

Senator Wolcott said: "If an extra session of Congress should be called to-day the Sherman law would not be repealed. Times are dark enough to indicate that a streak of light must break in from some direction soon. This means immediate disaster to Western interests, but it may be a blessing in disguise if we can hold on. If we suffer, the disaster entailed to Great Britain is worse, and the continued fall in the price of silver must force some international agreement."

From all quarters come accounts of mines and smelters closing down. There is a strong probability that the big smelting and refining works at Omaha will be closed down for the present. In the Wood River country, Idaho, it has been determined to cease shipping entirely, as the properties producing lead and silver ores cannot be worked at a margin. Those mines able to continue work without shipping will do so with a largely decreased force, while those not absolutely compelled to continue will close down altogether and await developments. At Butte, Montana, nearly all the silver mines are being closed down. The Alice, one of the largest producers, commenced closing down everything about the mines except pumps Wednesday; the mill will make a clean-up and then hang up the stamps. The Moulton and Lexington will probably follow suit in a day or two. Several of the smaller mines were also closed Wednesday. All ore purchasing has ceased. The copper mines of Butte will not cease operations, but the question of reducing the miners' wages from $3.50 to $3 per day is receiving serious consideration. Prominent mine-owners of Montana on Wednesday issued a call for a State convention, to be held July 6th, to take steps to impress upon the coming extra session of Congress Montana's demands. It is likely a strong organization will be effected, and Montana headquarters will be established at Washington.

India and Mexico have heretofore been the only countries in the world where the free coinage of silver was undertaken, and now with India stricken from the list, the United States, with its silver-purchase bill, will have only Mexico to assist it in keeping up the value of silver. Denver smelters feel very severely the drop in silver. They have on hand an average of about 500,000 ounces each, enough to last for several months without making any new contracts, but the trouble is there is absolutely no market for silver, and if the smelters cannot dispose of the products of their works it will be impossible to continue running. It is estimated that the smelters in Denver and throughout Colorado have lost in the aggregate $650,000 on ore bought during the last week and which has fallen so greatly in value in the last two days. It was bad enough when it went to 77 cents, but it is at present writing as low as 69 cents with no indications of stopping the downward movement, though speculators will doubtless try and increase the panic in the hope of profit later on.

The situation is not only bad for the silver miners, but for the lead and copper miners as well. The bulk of the silver of this country does not come from milling ores of silver mines, but those producing lead and copper as main products.

The following table, carefully compiled from information furnished by the officers and agents of the United States mint in charge of the collection of the statistics of the precious metals in the different producing States and Territories, exhibits approximately the sources from which the silver product of the United States for the year 1892 was obtained—that is, tho distribution of the product among the three classes into which argentiferous ores naturally group themselves, viz: (1) Quartz and milling ores (silver ores proper); (2) argentiferous lead ores; (3) argentiferous copper ores:

State or Territory.	Fine Ounces Silver in			Total.
	Quartz and Milling Ores.	Lead Ores.	Copper Ores.	
Arizona	949,720	112,500	.....	1,062 220
California	360 000	.....	.....	360,000
Colorado	10,500.000	12,100,000	1,400,000	24,000,000
Idaho	824 000	2,340,269	.....	3,184,269
Montana	9,200 000	2,350,000	5,800 000	17,350 000
Nevada	2,024 000	220,000	.....	2,244 000
New Mexico	625,000	450,000	.....	1,075,000
Utah	1,640,000	6,460.000	.....	8,100,000
All others	401,000	200 000	44,511	644,511
Total	26,522,720	24,232,769	7,244,511	58,000,000

From an examination of the above table it will be seen that of the 58,000,000 ounces of silver produced in the United States during the calendar year 1892, about 26,500,000 ounces were extracted from milling ores—that is, silver ores proper, while 24,200,000 ounces came from lead ores, and 7,200,000 ounces from copper ores.

It would appear, therefore, that less than one-half of the silver product of the United States is derived from mines producing silver ores proper, and that considerably more than one-half of the entire silver output of the United States is an incidental product from the smelting of lead and copper ores, although this incidental product is frequently more valuable than the other metals contained.

It is not only the silver mines pure and simple which are affected by this marked decline in the white metal. The argentiferous lead mines of Idaho, Utah and elsewhere cannot possibly go on under the present conditions. Lead itself is very low in price, and with the value of the silver eliminated these mines must stop. Even last year there was a greatly diminished production of silver in certain quarters, and the whole United States made a smaller silver product by 330,000 ounces than in 1891. All the States fell off in product except Colorado and Montana. The latter increased its product of silver over that of 1891 by 1,000,000 ounces, and Colorado increased nearly 3,000,000 ounces. The largest falling off is in the States of Nevada and Idaho, the product of Nevada having decreased from 3,500,000 ounces in 1891 to 2 244,000 ounces in 1892, and in Idaho from 4,035,000 ounces in 1891 to 3,164,269 ounces in 1892. The product of Utah also shows a decrease from 8,750,000 in 1891 to 8,100,000 in 1892. The Mint estimates the silver product of our mines for the calendar year 1892 at 58,000,000 ounces (troy) of pure silver, worth, at the average commercial price of silver during the year ($0.875 per fine ounce), $50,750,000, and of the coining value of $74,989,900, against a product in 1891 of 58,330,000 ounces of fine silver, worth, at the average price during that year ($0 988 per fine ounce), $57,630,040, of the coining value of $75,416,565.

As the greatest silver producers, Colorado and Montana will feel this sudden depression most, and more mines and miners will be affected in those States. Nevada, Utah, Idaho and New Mexico will also be seriously injured as to their mining interests, and proportionately in the order mentioned. With the exception of Oregon and Washington, California, among the mining States, will be the least seriously affected, our silver product being now only about 360,000 ounces per annum, while our gold yield is $12,571,900, or over one-third of the total of the United States. We have referred to this more fully in another column of this number of the PRESS.

The silver miners have thought they had fallen on hard times when silver was in the "80's," but now it is low down in the "60's," there is apparently nothing left for them to do but quit work and see if Congress can help them out.

California's Chance.

For once California, as a mining State, is in luck in having so few silver or lead mines within her boundaries. And she is still further in luck in having more gold mines than all the other States of the Union put together, and a greater variety of gold mines also. In this State we get gold from quartz, hydraulic mines, drift mines, river bars, river beds, banks, ocean-beach sands, black sand coast deposits and ordinary placers. Gold is our principal mineral product, and gold is what is wanted just now most of all. The bottom has dropped out of silver; lead is low and the silver-lead mines must stop with those of silver; and the situation is not good for those copper properties with silver as a by-product. In all the States they are shutting down the silver-yielding properties and are hunting for those which carry gold.

And this is California's chance. It would be improper to rejoice at the misfortunes of our neighbors, but this time what is their loss is our gain. If men want gold properties in number and variety, this is the State to come for them. Our gold belt is about 700 miles long and extends practically from one side of the State to the other. The ocean beaches yield gold; the tops of the Sierras yield it, and it is found on the desert boundaries. San Diego on the south has gold mines and so have Del Norte, Siskiyou and Modoc counties on the north.

Between these extremes there is scarcely a county in the State where the precious metal is not found in greater or less quantities. Even what are known as the purely agricultural counties take pride in their mining claims. Golden grains and golden fruit come from the same soil. Oranges on the surface and gold-bearing gravel below are common in Butte, Placer, Yuba, and other counties.

There are enough paying mines to yield nearly $13,000,000 a year now at work. But there are some thousands of undeveloped or partly developed claims and "prospects" which need capital to make them productive. This capital has been lacking in our own communities who have neglected the opportunities too close at hand, and too familiar, to attract the attention they deserve. But mining men from Colorado, Utah, Idaho, Montana and elsewhere, who must now desist from silver and lead mining, will soon commence looking into our gold prop-

ertles here, and there will be sale for all those showing any prospective merit. Even the mere prospects will now have some value, for any prospect may turn out to be a mine. It only takes money to prove the proposition.

California took the lead in gold production over all other parts of the United States as far back as 1848 and has maintained it ever since. Last year, though reduced to the enforced cessation of hydraulic mining, the gold yield of California was $12,571,900. The next highest gold producer was Colorado with $5,539,021. It is thus seen that California has a long lead over even the second best of the gold-producing States.

If men are looking for investments in gold properties, as they must soon be, this is the State where they will naturally come. They would not think of California for silver, lead or copper, though we have all these. There are other places far better for these classes of mining. But in gold product this State stands pre-eminent, and there are plenty of chances to obtain properties more or less developed.

Resumption of Hydraulic Mining.

The California Debris Commission has thus far done little of anything beyond organizing. Comparatively few petitions for license to mine have been sent in, though there are many inquiries as to methods of procedure before the Commission. Just now two of the three members of the Commission are absent from town on duty in connection with their regular river and harbor work. There is nothing definite to report concerning any examination of mines by the Commission. It will probably be some months before any mines obtain licenses to work by the hydraulic method.

In this connection it is interesting to note that the *Daily Report*, of this city, has suggested that hydraulic mining in California should be at once resumed, and all restrictions removed in order to increase the gold supply and relieve the financial situation. The suggestion to start up the mines again has met the approval of a number of people, and among them two who have the charge of as much gold as any persons on this coast.

These are W. H. Dimond, superintendent of the United States mint in this city, and Thomas Brown, the cashier of the Bank of California.

General Dimond, superintendent of the United States mint in this city, was asked what he thought of the *Report's* suggestion that the Government remove all obstacles from the resumption of hydraulic mining at once.

"I heartily approve of the idea," said General Dimond. "Why, the Government has in our hydraulic mines a bank to draw upon for untold amounts, and why should it not seize such an opportunity? We helped the Government out in the time of the great civil war with our gold product, and we can do it again."

"Is the mint in this city prepared to coin all the gold which the mines may send to it?"

"The mint has machinery sufficient to coin the entire yearly bullion product of the world. All that would be necessary would be an increase of force. We are now completing our annual clean-up, which began on June 14th. We will be through by the 1st of July, and the examiner from Washington will then be here to count the money. We now have on hand about $57,000,000 in coin, of which $11,000,000 is gold and $46,000,000 silver, mostly standard dollars. We have, besides, 8500 bars silver, valued at about $9,500,000. During the count these bars must be weighed separately.

"Let the Government remove all restrictions from hydraulic mining, so that we can handle California's enormous store which is locked up in our hills, and we of the mint will do the rest."

Mr. Brown's opinion he expresses in the following letter:

Editor Daily Report:—SIR: In my opinion, the resumption of hydraulic mining in California would be a decidedly advance step toward increasing the gold product of this country. The gold output of this State materially decreased when these mines were closed down 10 or 12 years ago. They were said to be producing at that time from $8,000,000 to $10,000,000 in gold per annum. Whether they could reach that figure again is perhaps questionable, since the restrictions of the new laws affecting them will only permit certain favorably located mines to be worked, and even those would be limited in the amount of gravel they could wash behind restraining dams. The yield would therefore be less than when all could be worked without restrictions. Moreover, in many instances, ditches, flumes and other works are out of repair and a great deal of money will have to be invested to put the claims in order for work. I am informed by those who are familiar with the details of this branch of mining that, under favorable conditions, at least $6,000,000 a year of new gold could be obtained even now if the mines were at work.

Few people realize what an immense amount of gold California has yielded, or what the possibilities of its various gold-mining interests are. Nowhere else in the United States has there been or is there such an extensive and productive gold-mining belt as is found in this State. Of course, Colorado, Dakota, Montana, Utah, Oregon, Nevada, Arizona and Idaho have more or less gold mines, but none of these come anywhere near reaching California. We produce here in this State over one-third of all the gold yield of the whole United States, and could easily produce one-half. This State is still the leading gold-producer of the Union, notwithstanding the comparatively light yield of recent years, caused to a great extent by the total stoppage of the hydraulic gravel mines. Of gold alone this State has produced nearly $1,300,000,000 in about 43 years. California, with its grand gold product, still leads the combined aggregate gold product of all the other mining States and Territories by a thousand millions, and leads the aggregate gold, silver and copper product of any one of them by over $600,000,000. In one year only, 1852, California turned out $81,294,700 in gold.

In 1892, according to the official report of the Director of the United States Mint, the gold yield of this State was $12,571,900. Of course silver, quicksilver, chrome, borax and other mineral products are not considered here, as I am speaking only of gold production. For a single industry of the State this is a very good showing, but when we have the means at hand to make a better one we should at least try to do so.

The people of this State generally seem to desire the rehabilitation of the hydraulic mining industry, which is a peculiar one, and limited practically to California. The Governor, in an official message, called the attention of the Legislature to this languishing industry, which might be made again productive with proper measures.

The Legislature of this State then petitioned Congress to look into the matter. This action and the petitions of the miners met the indorsement of the Chamber of Commerce, Board of Trade and Board of Supervisors of this city, and corresponding bodies in other counties.

At the last State convention of both the two great political parties favorable resolutions to this industry were passed. The result of all this has been that Congress has passed a special law on the subject and appointed a special Commission to carry it out. As to the means to be employed I have no special knowledge, but they are recommended by the Government engineers.

It is to be hoped that every encouragement possible within reasonable limitations be given to the hydraulic miners, and that every mine which can be worked without committing material damage to the streams will be permitted to do so. In this way our gold product can be materially increased, to the benefit of the communities in this State and to the nation.

San Francisco, June 28, 1893. THOS. BROWN.

These expressions of opinion from two such prominent gentlemen will have considerable weight in the community, and serve to show not only that the gold in these mines is needed, but it is known where it can readily be obtained. The financial situation demands gold, and with such a storehouse as we have at our command in this State, it is a pity to see it remain locked up. Public opinion on this subject has greatly changed in the past few years. San Francisco has sadly missed the many millions these mines might have yielded if worked. With six or eight millions of new gold a year coming into this city from these mines, times would not be so dull.

Foundry Notes.

The foundrymen of San Francisco, like most other people in business here, are having rather dull times of it just now, and there is comparatively little work in the shops. Large jobs and contracts are very few during the present stringency in the money market.

Some very interesting tests will shortly be made in this city as to the best boiler to be used on the new Mission-street electric road, now being built by the Pacific Improvement Company. Heretofore this company has only used the Babcock & Wilcox boilers on their cable roads and street railroad systems, but the results obtained from the Heine boiler of the Risdon Iron Works have been so satisfactory and convincing that it has been determined to make tests with several boilers as to which will give the best evaporative results with Carbon Hill coal. The Heine boilers at the works of the S. F. Gas Co., at North Beach, have been selected, and the Babcock & Wilcox boilers of the Geary-street cable road. The Elephant boilers at the Union Iron Works will also participate in the test. Messrs. Eckart and Wilson will represent the Pacific Improvement Company as experts during this test, which will be carried out during the next two weeks.

The Risdon Iron Works are making a number of Bryan mills and Johnson concentrators, but outside of this little is doing in the mining machinery line at their shops. At the Gold Bluff mine, Downieville, Sierra Co., where they have four Johnson concentrators, some very successful tests have been made with them. The superintendent writes that two machines did excellent work when they took the pulp from five stamps each. The tailings assayed a trace only, and that was so for several days when Mr. Johnson desired to run the pulp from the ten stamps in each machine. Assays of the tailings even then show wonderful close work.

All the exaggerated reports which were published about the Monterey at the time of her trial test have been thoroughly refuted by the action of the Navy Department. Irving M. Scott received a letter this week announcing that the vessel had been officially accepted. It is as follows:

WASHINGTON, June 22, 1893.

Union Iron Works, San Francisco, Cal.—SIRS: Referring to the Department's telegram to you of February 6th last, preliminarily accepting the armored coast defense vessel Monterey and to the report of the board appointed to conduct the final trial of that vessel, from which it appears that said vessel has fulfilled all the conditions of the contract and that no defects nor weaknesses in hull, machinery or fittings have been developed, and that the vessel has been completed in all respects except the fitting and securing of the side armor, the armored roof and sighting hood to both turrets, which will be done at the navy-yard, Mare Island, Cal., the Monterey is hereby finally accepted in accordance with the terms of the contract for her construction. H. A. HERBERT, Secretary of the Navy.

THE financial situation in this city is becoming easier now that collection day is over. The banks will probably give more accommodation after July 5th. It is not expected that the Pacific Bank will resume business.

Coast Industrial Notes.

W. A. FERGUSON has arrived at Bodie from Pittsburg. Mr. Ferguson is an electrician and will remain at Bodie permanently to look after the Standard Company's electric plant.

THE work of laying the Holly water system in Harford has commenced. The plant will be used for fire purposes only. A complete electric fire alarm system will also be put in.

THE Board of Trustees of the Reno Reduction Works, consisting of W. O. H. Martin, Henry B. Rule, H. H. Beck, C. T. Bender and Henry L. Beck, has appointed R. D. Clark superintendent of the works. A. B. Eastwood, a practical millman, has been appointed foreman and Harry Clark assayer.

WILLIAM BROWN accidentally struck an immense deposit of yellow ocher on his ranch near the North Pacific Coast Railway, not far from Santa Rosa. The deposit extends over the area of several hilltops, with only a thin covering of soil. The railroad company built a side track and a mill is being erected The first shipments will be made during the month of July.

ONE of the largest transactions of the Northwest, namely the transfer by the Tacoma Light and Water Company of their entire plant, valued at $2,000,000, to the city of Tacoma, was completed last week. The city now controls all the water and lighting rights, and supplies the entire city, private and public. C. B. Wright of Philadelphia has purchased $1,750,000 worth of the bonds.

GRASS VALLEY, Nevada county, has no complaint about lack of money in circulation as most places have just now. The mines are looking well, and the young prospects which have been started with outside capital show up very encouragingly. Grass Valley is just beginning to receive the impulse of outside aid in developing its mines, and the town is about to enter upon a period of prosperity not heretofore enjoyed. As this is the center of the gold-mining industry of California, the indications are good ones.

IT IS estimated that there are now in stock in this State 16,500,000 gallons of wine. Wine has been shipped out of the State during the last six months at the rate of 1,100,000 gallons a month, and the local consumption is about 500,000 gallons monthly. On this basis there will be on hand when the next vintage commences about 10,000,000 gallons. This is the smallest stock on haud at the commencement of the season for any year since 1886, and the outlook for good prices is therefore excellent The yield for the season is estimated at from 13,000,000 to 15,000,000 gallons.

THE "vaporite" Belvedere is a new excursion boat, the largest and finest of its kind ever built on the coast, and was launched from Geo. W. Kneass' Potrero yard on Wednesday, June 28th. The Belvedere is 15 20-100 net tons register, length 45 ft. 6 in., beam 9 ft., draught 3 ft. 6 in. Her cabin is 33 ft. long and will accommodate 50 people; it is all glass, having no less than 29 windows which can be raised or lowered at will. The motive power is a latest improved double cylinder 17 H. P. Union vapor engine The new boat, in addition to a daily trip to Belvedere will make night trips between this city and Belvedere and Sausalito. She will also run between San Francisco and Oakland, at the night hours when the regular ferry boats are not running.

THREE TEAMS, hurdened with copper matte, arrived Tuesday from the White Cloud smelter, says the *New Era*. The matte made a carload and has been shipped East to the electrolytic works at Ansonia, Conn., where the refining will occur. The opinion prevails that the White Cloud copper will prove to be of extra quality. This is the first copper matte shipped from Nevada within our recollection, though large quantities of copper, in the form of ore, have been shipped, the largest output being that of the Battle Mountain Copper Company, 15 miles south of the railroad at Battle Mountain, which produced sufficient metal to enable the English owners to declare dividends of $500,000 after paying transportation charges on the ore to Swansea, Wales.

A DISPATCH from San Diego says: This morning a letter came from the Colorado River Irrigation Company at Yuma that relates to the directors of the San Diego and Phœnix railroad. It offers a free right of way through the Algodones land grant on the Arizona side of the river. The letter adds that as soon as the railroad people decide on where to cross the Colorado, and locate from there their line to Yuma, the irrigation company will issue a right-of-way deed. It is said the company proposes to build a large canal from Yuma to the Mexican line, a distance of 22 miles, and border it with fruit trees and a boulevard. Should the railroad cross the river at that point, it would run along the bank of the canal, and it could have either side of the canal it preferred, and the irrigation company would grade the 22 miles of roadbed and give it to the railroad ready for the ties, free of cost.

B. W. BROWNE, of Washington, D. C., who is general manager of gold mines in Mojave county, A. T., 26 miles northeast of the White Hills district, is here to purchase a plant of machinery for the development of his property, including hoisting works. Mr. Browne has been mining there for some time and is much gratified at his success. He is milling gold ore that runs from $42 to $50 a ton. He has also secured a good supply of water, and will in future be able to push work on his mine more rapidly than ever. "A loss of much importance to us," said Mr. Browne, "was the burning of the mill recently of the O. K. Mining Company. This mill cost $60,000 or $70,000, and was being successfully operated. From the entire region about there, which is known as the Gold Basin district, they were getting out gold ore." Mr. Browne will take his machinery to Arizona in a few days.

THE settlement between J. Kirk Firth and his creditors has been completed and the terms upon which the embarrassed mechanical engineer will be permitted to continue his business have been determined. Firth's total liabili-

ties, incurred in the Phœnix Iron Works, amount to $80,-032.31. His assets are as follows: Book accounts, $15,-590.06; unfinished work, $2500; machinery and tools, $30,-000. There is a chattel mortgage of $26,500 on the plant of the iron works. It is held by Firth's father-in-law. There are also mechanics' liens amounting to $2424.40. The terms upon which Firth will be allowed to settle were upon a basis of 40 cents on the dollar. Ten per cent of his indebtedness must be paid within a year and 15 per cent in each of the following years completing the amount. He has given his notes without security upon these conditions, the date upon each being June 1st. On behalf of the creditors, William P. Sullivan Jr., of the Pacific Rolling Mills, and Oscar Lewis, have been appointed a committee to receive the payments and distribute proportionately to the creditors.

Mines of Humbug, Siskiyou County.

TO THE EDITOR:—I visited the mines on the head of Humbug last week, and prior to my visit I heard many discouraging reports in regard to the quartz mines there, from what I know now are unreliable sources. I was told that there were no well-defined ledges nor permanent mines in the district, and that it did not amount to anything as a quartz camp. This, however, is false, for the mines of Humbug compare favorably with those of any other district in California considering the amount of capital that has been invested there and the development work that has been done. The following statement of facts gleaned from visiting some of the leading mines in the district will give the reader an idea of what the mines really are:

Cartright & Phillips' mine was the first that I visited. This mine is situated on the north fork of Humbug and is an east and west ledge dipping to the south. The ledge has an average width of two feet and is incased in seynite walls. The pay chute extends over 300 feet on the ledges as far as it is opened out. There is about 12 inches of high-grade ore and from 12 to 14 inches of low grade in the pay chute.

What rock has been milled from the mine gives a return of from $45 to $48 per ton for the high grade and from $6 to $12 per ton for the low-grade ore. The lowest level is down 300 feet on the ledge, which makes it about 200 feet on the perpendicular. The depth of the first level is 100 feet and the second 100 feet lower. The ledge is opened up 375 feet on the lower level, which is tapped by a working tunnel 300 feet in length. But very little stoping has been done in the mine and only a small amount of ore has been taken out, the owners, Messrs. Cartwright & Phillips, having turned their whole attention to developing and opening the mine.

I next visited the North Star or Boyle mine, situated also on the North Fork of Humbug, about three miles from Cartwright & Phillips' property. This mine is on a north and south ledge, at an altitude of 4000 feet. It is opened up to a hundred-foot level, and a crosscut to tap the ledge 230 feet below the 100 foot level is now nearly completed. The pay chutes in the mine are extensive and average about 18 inches in thickness, the ore being high grade. The ledge averages about two feet and is incased in porphyry walls. Mr. Boyle is working a full force of men, and the mill, which consists of a four-stamp battery and a Huntington mill, is kept going most of the time night and day on the output of ore from the mine. Mr. Boyle has the well-known Spencer mine, which is situated near the North Star, bonded, and will commence opening out a new body of ore shortly. This mine produced over $100,000 for its former owners in less than three years.

I next visited the Oro Grande and the Hunt mine on the Middle Fork of Humbug. Messrs. Coulson & Thrash, the owners of the Oro Grande, are both practical and experienced miners and are developing their mine in a workmanlike manner. It is a north and south ledge, incased in a porphyry hanging and a hard limestone foot-wall. The ledge averages 29 inches in thickness and is high-grade rock. They have tapped the ledge with a working tunnel at a depth of 150 feet, and are now drifting from it each way. From all indications it promises to become a big paying mine.

The Hunt mine is also a north and south ledge and is situated below the Oro Grande on the Middle Fork of Humbug, near the creek. This mine does not possess one advantage that all of the above-mentioned mines do, viz., that of being worked by tunnels, consequently it necessitates the extra expense of hoisting and pumping. There are two levels in this mine, the deepest being 140 feet. The drifts extend 65 feet on the lower level on either side of the working shaft at present, but are being driven farther ahead as rapidly as possible. The ledge is incased in porphyry wall and has an average width of 18 inches, and is all high-grade rock. A rich body of ore was struck a few days ago in the north drift that exceeds anything that has yet been found in the mine. The mill, which is situated at the mine, is kept going most of the time.

I visited some prospects also in this district that bid fair to develop into good-paying properties, and, taken as a whole, the prospects for a bright future for it are flattering, to say the least. ALEX. QUARTZ.

Yreka, June 21, 1893.

Miners' Wages.

The MINING AND SCIENTIFIC PRESS predicted some months ago that a much further decline in the market value of silver would be followed by a reduction in the wages of miners. Quite a number of mines had already shut down before the present crisis which were unable to continue paying the ruling rate of wages. This was one of the prime factors in the shut down of the Bunker Hill and Sullivan and other mines at Cœur d'Alene, Idaho, some weeks since, though little was said of this feature. Now, one of the largest mine owners in Colorado says that unless the miners who have been receiving $3 per day will accept two-thirds of that, he will have to close all his mines. At Butte, Montana, the mine owners are discussing a $3 rate instead of the prevailing one of $3.50. The Miners' Federation, recently organized, will doubtless resist this, and the result will be that the mines will stop work. Mine owners who would gladly pay the present rates if possible, cannot do so at ruling rates of products, and must stop work unless there is a change. They claim that this is the only alternative. The miners must decide this matter for themselves.

Quicksilver Mining Suit Decision.

The big mining suit of the Altoona Quicksilver Mining Company vs. the Integral Quicksilver Mining Company, which has been on trial in the Superior Court of this county since May 31, was brought to a close last Wednesday, says the Trinity *Journal*. The jury brought in a verdict for the plaintiff. This action was the most important that has been brought in the county for many years, if not the most important ever brought here. It was brought to determine the right of possession to the Central Quicksilver mine, in the Cinnabar mining district, and many nice law points were involved in the case. Every legal proposition advanced by either side was stubbornly contested and exhaustively argued. The trial lasted 19 days and was replete with interest. The case was so ably conducted by both parties and the ability of the counsel was such that the usually dry materials of a civil action became intensely interesting.

In May, 1892, the Integral Quicksilver Mining Company filed its application for a patent to the Central mine, in the Land Office at Redding. On the 18th of July, the same year, the Altoona Quicksilver Mining Company filed an adverse claim at the Land Office for the same piece of property, and on August 16th filed its complaint in an action to determine the right of possession to the same.

The cause came on for trial on the 31st of last month. A jury was impaneled and sworn, numerous witnesses were examined and much documentary evidence introduced. The plaintiff rested its case on the 16th inst. and defendant closed on Monday.

Argument began Tuesday morning, Hon. T. W. H. Shanahan opened for the plaintiff, and in an able argument presented the plaintiff's side and made an exhaustive review of the testimony and the facts of the case. Mr. Shanahan is an able and forcible speaker and held the close attention of the jury.

In the afternoon G. D. Reid, Esq., replied in an exceedingly well-chosen and logical argument, thoroughly covering every point presented by him. He spoke in an earnest and impressive manner and made every point with skill and effect. In close reasoning and proper arrangement of the issues it was one of the best speeches of the trial.

He was followed by Ex-Senator Reddy, also for the defendant, in one of his characteristically powerful and analytical arguments. Mr. Reddy addressed the jury for over two hours, and when he had finished the defendant's case was clearly and ably presented—nothing omitted and nothing slighted.

Wednesday morning Senator Ford closed for the plaintiff in a most eloquent speech. The Senator has the gift of oratory in a high degree and for an hour and a half entertained a crowded courtroom. It was a splendid and effective effort and was highly appreciated.

In the afternoon Judge Jones read his instructions to the jury, who, after a deliberation of about three-fourths of an hour, brought in a verdict for the plaintiff.

The Altoona Company was represented by Hon. T. W. H. Shanahan, Hon. Tirey L. Ford, District Attorney Bartlett and H. R. Given, Esq. D. G. Reid, Esq., and Hon. P. Reddy appeared for the defendant.

Boring Machinery for Prospecting Gravel Mines.

In the PRESS of last week mention was made of the method of prospecting drift claims on the Forest Hill divide with an artesian well boring apparatus. We have since been informed by Mr. Chappelet, president of the Mayflower Mining Company, that the fourth hole is run down 250 feet and is being sunk at the rate of 10 feet per day. During this sinking the drill has passed through considerable "nigger head," what all miners know is difficult to bore through. There has been no trouble with this, however. The expense of this boring is a trifle less than $2 a foot with four men working two shafts. It is proportionately less for deep than for shallow holes on account of less frequent occasion for moving the derrick, tools, etc. Mr. J. O. Jones, the superintendent of the Mayflower mine, under whom this work is being done, is an experienced miner, having formerly held a similar position in the famous Bald Mountain drift mine in Sierra county and the Morning Star mine in Placer county.

In this connection it may be stated that the American Well Works of Aurora, Ill., who make a specialty of artesian well apparatus, have lately issued a large catalogue illustrating and describing the various forms of apparatus used for different conditions of work. It will surprise one not familiar with the subject to see to what extent this branch of manufacture has grown. The catalogue is practically an encyclopedia of well boring apparatus, with descriptions and instructions for operating. There is a great variety of "rigs" adapted for all kinds of work, large and small. They make not only drilling machinery, but steam pumps and valves, windmills and farm pumps, ditching machinery, etc., and have such a variety that they have four complete and separate exhibits at the World's Fair.

IT is reported that the Arizona mine of Unionville is soon to be sold to the same parties who bought the Blackhird mine of Central. If this report be true, Unionville, the town which was at one time the county seat of Humboldt county, and which had over 1000 inhabitants, will again see better days.

Nevada Minerals at the Fair.

A Chicago correspondent says that no space has been reserved for Nevada's exhibit at the World's Fair, the State having waived all rights to any recognition owing to the fact that the Legislature in 1891 refused to make an appropriation. The United States Commissioners, however, prevailed upon the chiefs of several departments to reserve space, hoping to raise a sum through private sources sufficient to make a small display and have the State represented. In this, however, they failed, and it looked as though Nevada would be the only State not represented. The space thus allotted could not be retained after September 1, 1892, and was withdrawn.

The action of the last Legislature appropriating $10,000, although at the eleventh hour, was received as encouraging news by the director-general and chiefs of departments, and they showed their appreciation by rendering to the State all the assistance in their power, with the result that the State exhibit is located in four departments. Unfortunately, the principal industry is not displayed to the best advantage. Instead of having a prominent space on the main floor of the magnificent building of Mines and Mining, where an exhibit could have been made that would have challenged the world, the display is virtually on the west gallery in the mineralogical department, occupying a space of 2037 square feet.

The State is well represented with a display of choice minerals. One large case is devoted to the ores of the Comstock, showing the character of the ore obtained from every mine on the lode, including a bunch of Savage ore taken from the 3200-foot level, the deepest point from which ore has been extracted in the world. All the mining districts in the State are represented. The gold ores are quartz, wire and placer. The silver ores include ruby (one piece weighing 108 pounds, from the celebrated Manhattan, at Austin, assaying 7000 ounces to the ton), black metal, native, wire and horn.

Besidss, there are splendid specimens of lead, galena, antimony, iron, nickel, cohalt, tin, copper, cinnabar, manganese, zinc, salt, borax, soda, sulphur and mineral soap. There are also specimens of garnets, viriscite, tourmaline, agates, rough amethysts, onyx, marble of different grades and building stones.

White Pine sends a special exhibit of rich silver ores, which was sent on and maintained by Wren & Grandelmeyer. The Morrison & Snyder special exhibit from Eureka, valued at $30,000, is one of the finest private exhibits in the building and attracts a great deal of attention.

On the east gallery, in section 48, a display of sodas, borax, silica and salts is placed in competition with the world. This exhibit shows the products named and their native states as taken from the marsh, comprising borate of lime in mud, cotton balls, tincal in mud, tincal crystals, soda in a native state, trona, soda ash, soda crystals, salt in solution, table and dairy salt made by solar evaporation, silica in a pure state, as mined, and then all these things in a refined state, making the only display of a similar character in the building.

Washington Not Well Represented.

Few men but have a desire to kick at times. It is a bad habit, for it grows. But we want to register one kick and then subside. The opportunity to display the wealth of the forests of Washington at the World's Fair has been lost. It is too late in the day now for the commissioners to write letters, as is being done, and ask our lumbermen to send samples of lumber. It is too late to get sections of trees—in fact, it is too late to do anything but stand around the miniature farm now on exhibit in the Washington building, and try to imagine that it teaches or illustrates anything above the idea of a ten-year-old boy. It is worse than Horace Greeley's book on "What I Know about Farming"—in fact, nothing could be as weak as it is. Visitors laugh at it and sensible men advise throwing it into the back yard before any more see it. The forest exhibit is a failure, the agricultural exhibit is a failure, the mineral exhibit is a failure, but it has one redeeming feature. No one but an expert can detect the fact that not ten per cent of the ores shipped to Chicago from Washington are of any value. They were condemned before they were sent. The exhibit of our timbers was made a failure as far as possible by painting them to save finishing them in oil to show the grain of the wood. We are thankful they did not let some company, that would do it for nothing, give the handsomely carved seal a coat of asphalt. The idea of the commission seems to have been to get anything so it cost nothing—that is, excepting their own services. If the building could be locked up, and a notice stuck on the doors that Washington exhibits could be found only in Washington, we think that the good impression made by the exterior of the building and the big logs donated by our lumbermen would not be obliterated soon. There—we feel better.—West Coast Lumberman.

MINE BELL SIGNALS.—The MINING AND SCIENTIFIC PRESS, of San Francisco, issued as a supplement a copy of the new code of mine-bell signals which must be obeyed or the company may be subject to the penalty in such case provided. The PRESS says: "The system is not quite so simple as could have been wished, and many superintendents complain of its intricacy." The superintendents of Grass Valley district were bitterly opposed to the rules included in the bill when they were first published and used every means in their power to have the bill defeated. The mines of this district have a system of signals that has been in use for years and with which every man employed in or about the mines is familiar. To change these signals will cause considerable trouble and may result in serious mistakes being made, as our miners have been accustomed to the present signals for so long a time that it will be hard to make the change. But we suppose the law will have to be complied with and the new rules adopted.—Grass Valley Tidings.

The Great Northern Railway.

Some twelve or fifteen years ago a clear-headed, stout-bodied steamboatman of the Upper Missouri conceived the notion of building a railroad from the Falls of St. Anthony into the rich Red River country. He had no capital to speak of, but he had a big idea. It was to build, equip and operate a railroad *upon business principles*. He looked about him and saw that no such thing had ever been done in the United States, and he believed that when done it would break down and over-ride all competitors. The Northern Pacific Company had a line into the Red River country, but Mr. Hill—for it is "Jim" Hill that we are telling about—saw that it was heavily over-capitalized, that it was clumsily managed from the New York office, that its operating expenses were double what they should be, and that it was required to pay dividends on three times its actual cash value. Said Jim Hill to himself: "I will build a railroad from St. Paul to the Manitoba line just as I would build a house—that is, without fuss or feathers, under my own eye and for cash. The central office of my road shall not be in Wall street, New York, but right here on the road itself. The management will be vested not in a series of high-salaried general, special, assistant and department managers, but will be kept directly under my own hat. With me to lay out the plans and to direct the work, with one first-class lawyer to keep me advised as to the law, and with one first-class engineer to look after those parts of the business, we ought to get along very well." And thus was born the Manitoba Railroad.

Mr. Hill knew the country and he knew the transportation business. He went to the financial centers, laid the facts and his plans before the investors—and got the money. He then returned to St. Paul and built the road, built it as he had proposed under his own eye and for cash. There was no rosewood-lined general office in Wall street; there was no "Construction Company;" there was no vast "headquarters" at St. Paul filled with officers and clerks; there were no special cars filled with champagne and "magnates." There was, in fact, just plain Jim Hill under a broad hat and in top boots out at the front with his chief engineer, and both very hard at work. They bought the best material, and they personally saw to it that it was put down in the best way. They saw the engineering mistakes of the Northern Pacific line, and they avoided them. The work, performed under the master's eye, went forward with unprecedented vigor; and when it was done the railroad men of the country saw with amazement that it was shorter, that it had fewer curves, that it had lower grades, and that it had a better track and better cars than the N. P. line; and Mr. Hill made no secret of the fact that its total cost was about one-third of the former's "capitalization." And when it came to operating the new road the same principles of simplicity and economy were enforced. There was a little office and a few clerks, but the "President," the "Assistant to the President," the "Engineering Corps," the "General Manager," the "Assistant to the General Manager"—these and the hundred other titles with each of which ordinarily goes a man, a fat salary, a private car and a dozen secretaries and clerks—were all summed up in Mr. Hill, his engineer and his attorney. Out on the road there was only one man to do one man's work, one engine to do one engine's work, etc., etc.

Very soon the profits became large, and Mr. Hill saw that an easy way to make them larger was to build the road out West. To make the story short, he has kept on building West—all the while keeping the original idea in mind—until his road is now complete and in operation between St. Paul and Puget Sound.

Mr. Hill's road—he calls it the "Great Northern"—runs parallel with the Northern Pacific for two thousand miles, and from the day the first spike was driven on the former, there has been mutual jealousy and dislike. The Northern Pacific people have said that Hill was an adventurer and a fakir, and that his schemes would collapse and bankrupt everybody connected with them. Hill has said: "Wait and see. I will make a road straighter and better than the Northern Pacific line. It will cost not above one-third of the N. P.'s 'capitalization;' it can make money at half the rates charged by the N. P. When it is done I will put transcontinental transportation on a business basis, and within one year from the time I begin to haul through freight, the N. P. will be in the hands of a receiver."

That was five years ago. Mr. Hill's transcontinental road is an accomplished fact; trains are now running over it regularly, and last week a cut averaging about twenty-five per cent, as compared with Northern Pacific rates, was made on all classes of traffic between St. Paul and Seattle. Now the Hill road, built in economical times and by business methods, and operated by the same methods, can do a profitable business at the cut rates, but the Northern Pacific cannot. The latter has met the cut by an equal reduction, but it cannot run at this rate long without running into the hands of a receiver. The question now is, will Mr. Hill's desire for revenge lead him to stick to the cut rate, or will he combine with the N. P. in restoring the old rates. The pressure will, of course, be immense. All the other transcontinental lines are in the same boat with the Northern Pacific. If Mr. Hill puts rates down then they will all have to come down, and that means disaster, because they are organized on a basis which requires them to earn profits upon three times the actual value of their roads. It is a settled principle of railroad policy that there will be no prolonged competition where combination is possible; and it is therefore to be expected that the old transcontinental roads will make it an object for the Hill road to come into the combination to maintain rates. That, we fear, will be the end, though persons who know Mr. Hill say that he is in a position to force the fighting, and that he will not quit till he has driven his chief competitor to the wall and made the reduction a permanent one.

The real significance of the Hill road is the lesson it has taught the county concerning the matter of railroad building and management. He has demonstrated that the present method of building and operating railroads is extravagant and wasteful in the extreme and that it puts an enormous and unnecessary tax upon the country. He has shown that with lines of railroad rightly built and rightly conducted there is good profit in the transportation business at one-half the rates now exacted.

We have all along contended that nobody begrudged to the transportation companies a fair rate of interest upon their investments. But the country does begrudge the payment of rates calculated to yield interest on two or three times the actual value of railroad investments.

In a little book on American railroad investments, written by Mr. Van Oss, an Englishman, for the information of English investors in American railroad securities, we find a thorough review of the ways in which railway "capitalization" is piled up. "In the main," he says, "there are six different ways of inflating the capital of American railways," as follows:

(1) "By fraudulent issues of bonds and shares as a downright swindle for speculative purposes." Example: "Fisk and Gould increased the share capital of the Erie road between 1868 and 1872 from $17,000,000 to $78,000,000, mainly to manipulate Wall street." (2) "By paying too much for construction." Example: "The South Pennsylvania Railroad has been proven to have cost actually $6,500,000, and a responsible contractor had offered to build it at that price, yet a construction company composed of Vanderbilt's clerks received $15,000,000 to complete it, and the syndicate of capitalists which supplied this money got $40,000,000 in bonds and shares, so that for every dollar of actual cost over $6 of bonds and shares were issued." (3) "By purchasing properties at excessive prices." Example: "The Coal and Iron Company of the Reading affords one of the most famous cases, this concern being paid for, it is said, at the rate of at least twice its intrinsic value. Years ago it was a common thing for railroad directors to buy up property in their private capacity and then sell it to their company at an immense profit, and until 12 or 15 years ago the majority of purchases of auxiliary concerns used to be with fraud." (4) "By buying superfluous competing lines." Example: "The Pennsylvania had to arrive at a compromise with Vanderbilt, resulting in the construction of the South Pennsylvania road being suspended, if it wished to see its monopoly maintained in Pennsylvania." (5) "By selling bonds and shares at a discount." Example: "The New York Central, Erie, Reading, St. Paul, Chicago & Northwestern, in short almost every railway company, as a rule, receives nothing for the earlier issues of its ordinary shares, although, as is well known, shares are no longer given away, and frequently sell at good prices." (6) "By declaring stock dividends." Comment: "The fictitious capital resulting from the payment of stock dividends amounts to a sum second only to the inflation caused by the sale of securities at a discount." Example: "The most famous stock dividend ever distributed was one of 80 per cent, paid in December, 1868, on the shares of the New York Central Railway Company, and 11 months later, when the consolidation of the Hudson River Railroad followed, a further stock dividend of 27 per cent was declared, while the Hudson River Railroad shareholders received one of 85 per cent."

Taking all these methods together, Mr. Van Oss reaches the conclusion that for $4,650,000,000 of railway stock now in existence, the original investors certainly paid not more than $465,000,000, or ten per cent of their face value, "and probably less." Hence, railway stocks paying 1.8 per cent on their face value "return at least 18 per cent per annum upon actual investment." Mr. Van Oss, it may be said, is the very opposite of a radical, and justifies all this watering of stock, because "by inflating capital the railroads conceal the profits and thwart the designs of rate-reducing railroad commissioners."

If the evil of this inflation of railway "capital" affected only the holders of railway stocks, there would be little reason to complain; but in reality it affects the stockholders less than it does the general public. The capitalization of a railroad, fraudulent though it be, is made the basis of transportation charges. For example, if a railroad is "capitalized" at $50,000,000—no matter what its real value—it is required to earn money enough to pay current rates of interest on fifty millions after all the costs of operation are discharged. With these facts in mind, the reader will easily comprehend why the Jim Hill road is such a disturber of the peace of mind of the railroad world. Here is a road complete and as good as its rivals, but capitalized only at its actual value, or less than half of any other transcontinental line. It can make good profits with half as much business as is required to support the Northern Pacific, as it can carry double the amount of freight for half the present rates. It is likely to make revolution in the railroad capitalization of the country—at least it ought to open the eyes of the public.

RUSSIAN DEVELOPMENTS.—A want which has long been felt in Siberia is in a fair way of being satisfied. It is proposed to establish a school of mines at Irkutsk, for the purpose of educating mining engineers and metallurgists, with the ultimate view, in connection with the construction of the Trans-Siberian railway, of greatly developing the exploitation of the mineral deposits of Asiatic Russia, especially the auriferous beds. In contradistinction to this progressive movement, however, it is announced that the Czar's Government has decided to close three State mines and works in the Altai Basin yielding and treating argentiferous ore, namely, those at Barnaoul, Pavlov and Loktev, respectively; but the districts will probably not be a great loser thereby, as the land has been let on long lease to private individuals for the establishment of sugar-mills, distilleries, etc. The development which is, however, most likely to interest manufacturers is the formation, with a capital of 1,000,000 roubles, of a company at Kharkov with the object of assuming the proprietorship of, and considerably enlarging, a certain foundry and engineering works in that town, and manufacturing agricultural implements and machinery on an extensive scale. The new concern, which is styled the Heldevich-Sade Company, has already opened depots at such places as Poltava, Krementchug, Rostov-on-the-Don, and Armavir.

THE excitement over the tin discoveries, eight miles to the southeast of Lovelock, Nev., has quieted down, awaiting a better knowledge of tin ores. Tests are being made of the character of the ores found.

Working Ores in South Africa.

A correspondent of London *Machinery*, writing from Johannesburg, South Africa, has this to say about affairs in the Rand: In criticising a paper on gold amalgamation by M. C. Warnford Lock, a correspondent writes: "Mr. Lock and many other would-be reformers of practice are on the wrong tack altogether. They are trying to find an apparatus which with one crushing and one amalgamation will save the maximum amount of gold. According to all sound analogy and experience they will never do it in the world. Successive operations, beginning with relatively coarse crushing and ending with the treatment of slimes, are necessary to maximum economy and efficiency of extraction. This was found out long ago, and the contrary proposition, which begins to be agitated again, is simply the revival of an exploded error." It is pleasing to hear a recognized authority saying precisely what I have maintained over and over again, and which has been more than once referred to since. It appears to be the very perfection of bad practice to reduce ore to a minute grade at the outset, when there is no necessity for it, and then endeavor to mend the mistake by the use of an inverted process.

The slime separators at the mill belonging to the Salisbury and Jubilee Companies are doing such successful work that Mr. Hennen Jennings is preparing plans for their erection inside the cyanide works themselves, so that each set of vats (four) belonging to the two companies will have its own separatur placed over them in the center. In this way the tailings will run directly from the elevator wheel to the cyanide works, and, being freed from the slime in the separators, will at once pass into the vats, so that there will be no handling of the stuff at all until the solutions have done their work. This method will cost nothing, and will be, therefore, a great saving over the present one. The filling of the vats directly from a separator has already been tried, and has been shown to be quite practicable. Mr. Burrowes, late of the Robinson, has general control at the mill and cyanide works.

It is satisfactory to note that shortly the use of electric light and rock drills will be almost universal on the Rand. Where they are not now in use, work to supply both has either begun or is in contemplation. They are recognized as almost as necessary as a good water supply. The harder the rock the more useful the drill; its work, compared with the work by hand, is phenomenal, being almost as five to one. The work of training men to the use of rock drills is proceeding satisfactorily, for, as was said by me a short while ago, their utility depends as much, if not more, upon the use by capable men than upon the machine or its maker.

Almost every day the mining world is offered a new process for ore reduction. This is particularly the case out here, where the assays of ores show the presence of silica, alumina, zinc, silver, lead, sulphur, iron, copper, antimony, manganese and arsenic. The latest process of the kind which is to be introduced is called the Russell process. It consists in roasting, and after treatment by leaching in a special solution that is highly effective in dealing with the singularly refractory ore, 87.57 per cent of the gold is extracted, besides saving the lead and other baser metals. The inventor hails from Utah, where the fame of the Rand seems to have lately penetrated.

Here is yet another process already referred to more than once in the columns of *Machinery*. Although very little is heard of this process at present, Mr. Turton is quietly completing his arrangements at the works on the old Isabel mine, south of the Main Reef G. M. Company's ground. The vats have a capacity of treating 25 tons a day. It has been stated, and to some extent believed, that while Mr. Turton's process was capable of extracting practically all the contained gold, the process of precipitation was defective. This is erroneous, for, as a fact, although there is still something to be perfected, the gold is precipitated in almost a pure state, equal to a value of at least £4 per ounce. He has also been able by a simple addition to reduce the cost of working considerably, and at no very distant day there is likely to be a considerable stir in the mining world as to the simplicity and cheapness of his process. Of course the manufacture of sulphuric acid in the vicinity will be a matter of considerable assistance. The chief benefit of Mr. Turton's process will be in the immense saving in manipulating ore. It can be treated when crushed to the size of a marble, and roller mills will only be necessary. On leaving these the bruised ore can at once pass into the vats and come in contact with the solvent. By this means the use of plates, concentrators, and the accumulation of tailings containing gold will be avoided, Mr. Turton claiming for his process that the stuff after leaving the leaching vats is of no further value. It will be seen that if this is done only one hauling will be necessary, as against two or three with other processes, which necessitate very fine crushing or the treatment of tailings. In all probability the secrecy of the experimental stage will soon give place to publicity, and to a practical demonstration of the gold won that will probably have a favorable effect on Rand mining. A Turton's plant, I am informed, is to be erected and worked on the Black Reef, where, as is known, the ore is very highly charged with pyrites.

MINES IN THEIR RELATION TO EMPIRES.—Prof. N. S. Shaler, in *Donahoe's Magazine* for June, says: "The influence of mineral resources on the development of commerce, and, secondarily, on the paths of conquest, is evident even in the early history of Europe. Thus, to take but a single instance, access to tin of Cornwall evidently did much to favor the development of the Phœnician people. It was clearly an element of importance in the influences which led the Greeks to the western parts of the Mediterranean; it developed trade routes by the way of the sea to Britain, and across France from Marseilles to the ports on the British channel. Still further, the knowledge thus acquired appears to have directed and induced the Romans to that conquest of Great Britain which, though temporary, endured for centuries, and had a lasting influence on the

history of our race. From this ancient time to the present day, the paths of conquests, both of commerce and of arms, have, among civilized peoples at least, been to a great extent directed hy the desire for mineral wealth. The last great conquest nf this generation, and which gave to Germany the provinces of Alsace and Lorraine, though it may appear in history as a matter of pure politics, had for its final purpose the transfer to the cooqueror of the only valuable coal fields which France possessed. The results of this change may, in the tlme to come, be most momentous."

The California State Fair of 1893.

The fortieth annual State Fair of California will be held at Sacramento September 4th to 16th ioclusive. The premium list just issued contains classified awards amounting to $20,000 in cash for agricultural, mechanical and industrial exhibits. These annual exhibitions have been most successfully managed by the State Agricultural Society for the past 39 years, and it is the intention of this society to give the public a progressive exhibition for the current year.

The producers of California demand these annual exhibitions to assist and stimulate the various industries of the State, and notwithstanding the counter attraction of the World's Fair, find it essential tn cater to local trade. Consumption of home products still continues and the farmer and manufacturer must have opportunity to show what is being accomplished within the confines of nur most productive State. Not to do so would invite stagnation of trade and subsequent inattention to our productive qualities. Hence it is quite necessary that unusual efforts must be put forth this year in all the various branches of trade and commerce to prevent depression and encourage the sale of home productions.

There still remain thousands of acres susceptible of culture of many uodeveloped agricultural resources, the sale and cultivation of which would not only give us increased population, but permit the investment of money that would give most satisfactory returns to investors with great benefit to the State as a whole. Increased opportunities for production means additional facilities for the use of our circulating medium, thereby giving an impetus to all kinds of trade.

California's chief industry being agriculture, she must continue to advance it in every possible way. Failure to show her productive qualities one season would give the impression abroad that her capabilities are on the wane, whereas no greater progress in soil culture is being made at the present time in any part of the world than in this State.

The merchant, when trade is dull, inaugurates different plans for stimulating business. The farmer would do well to follow his example, and when crops are short and prices depressed, he should show unusual exertion in keeping his industry conspicuous hefore the people, lest the outside world would he led to believe that agriculture in this great State had retarded.

Periodical set-hacks occur in all branches of trade, and hut for the activity of the merchant, would be a standing menace to investment. This state of affairs is overcome in many instances by his efforts to stimulate, and success appears in many cases where failure is most apparent.

It therefore behooves the agricultural community of California to make an unusual showing this year at the State Fair; a meager one would be disastrous to our World's Fair exhibition, as the effect would tend to signify onr productions as there shown were unusual.

The premium list as offered by the State Agricultural Society contains sufficient cash awards for agricultural products to warrant the various counties in making up a representative display of their varied soil productions.

To the manufacturers of California we would say, as a means of promotion of your interests, a general exhibit by factories should be made at the State Fair of 1893.

There is at the present time a growing feeling in this State towards the advancement of our manufacturing interests, occasioned by the prospective development of our most available but heretofore unused water-power, which promises, in conjunction with the modern use of electricity, to give us what has in the past been the most important drawback to this iodustry, cheap motive power. A little agitatioo at this time of the interest would be most effective.

Therefore, extraordioary efforts should be made to show some of our established plants in operation at a State gathering, not ooly as a means of encouraging trade, but as a matter of inducement to capital to invest, as there are many factories that could be increased by the use of additional capital now that a cheaper power will soon be available.

The representatives of other States are here each season to display manufactured goods. They readily recognize the value of this agency to reach the consumer. Local manufacturers should not permit those from distant States to meet their trade without an equal showiog of their ability to supply this trade.

Exhibitors at the annual State Fairs of the past are familiar with the advantages to he derived by an exhibit of their products; to those unfamiliar, we would say:

The great State Fair of California has been held for 39 consecutive years, and is thereby valuable as ao introductory agent by reason of Its established permanency.

The Califoroia State Fair offers cash awards for State products amountiog to $20,000 annually.

The California State Fair includes an exhibition of a most varied nature. The display of blooded stock is a most conspicuous adjunct to the great show of agricultural and Industrial products that each season congregates in the largest exposition building on the Coast.

The Califoroia State Fair Speed Department holds its usual prestige as an attraction for the multitude who desire to witness the equine cootests as an amusement, to say nothing of the exhilarating effect of this out-door sport. It has been a most important auxiliary in attracting visitors who are sure to examine during odd times the products of California as shown in the different departments.

The awards of the California State Fair are of much benefit to exhibitors, as competition is great, and merit here recognized is surely to be recognized in trade.

The California State Fair of 1893 will be provided with extra attractions for visitors. Its great success in the past emboldeos the management to keep abreast of the times, and the demands of progress is sure to attain additionat benefits for exhibitors.

The annual attendance at the State Fair aggregates 50,000 visitors, thereby offering advantages not to be found elsewhere on the Coast for the producer to meet the consumer.

This opportunity in the past has been readily recognized by all concerned, and it is expected that increased efforts will be made this year to show most fully the manufacturing as well as the agricultural resources of California.

Collection of intending exhibits should begin at once.

Applications for space and all question for information will be immediately answered hy the secretary.

EDWIN F. SMITH, Secretary

An Ideal Nevada County Mining Town.

The canyon of the South Yuba is always grand and beautiful, though in some places it is grander than in others, says the Nevada *Herald*. But from the lower foothills to the river's headwaters the canyon is worth seeing, and every curve of the stream presents some new delight to the eye. To the tourist who goes for the first time to the town of Washington, the first glimpse of the canyon is a revelation. The hills are as high as those of Yosemite, and "as steep," as a prospector expressed it, "as the trail to heaven." They are grand and majestic, in places covered with a dense growth of timher, but for the most part rocky and sparsely timbered. The noonday sun beats down on the rocky hillsides, and the outline of the largest pine and the smallest chaparral is boldly drawn on the blue serpentine rock which lies everywhere.

For over four miles the road winds down the steep declivity from the top of the ridge to the river. In places it is so narrow that a man on horseback could not pass a stage or wagon. Following the road down the top of a sloping ridge, the traveler suddenly crnsses the same and finds himself on a jutting spur where he seems to hang between earth and sky. Above him are the blue heavens—below, 2000 feet or more, the crystal waters of the South Yuba are leaping and bounding over the rocks, and roll away out of sight down the winding canyon. It is a grand sight, almost equal to Cape Horn or any spot on the American river.

We drive carefully now, and after a few turns around the rocky cliffs the little town of Washington appears in sight, almost directly below. It is a pretty spot. A little flat in a deep basin of the canyon, where white cottages can be seen through the green trees, and just across the river lies a green pasture and an orchard. A few more turns and we are down on the flat, and drive through the only street the place boasts of, up to the hotel door, where we are warmly welcomed by the best-natured landlord in the mountains.

The town itself is an ideal California mining camp—such a place as Bret Harte may have lived in when he wrote his tale of "Roaring Camp." All the characters of Harte's book can be duplicated here, and here can be found the broad plaza or street, its low houses, its clear and sparkling water. The men who lounge about the shaded porches have been here for 10, 20 or even 30 years, and many a story cao they tell of the days when the camp was flush, and hundreds of men were at work in the deep canyons hereabouts. But the river still roars as of old, the pack-trains of diminutive hurros are stlll seen on the plaza, and the arrival of the daily coach is as much of an event as it ever was, and so the old boys are content to live and die in the old camp.

DEMAND AND SUPPLY.—When aluminium manufacture first began in this country on a commercial scale only a few years ago it was stated that the price of the metal would always remain high because of the necessity of importing the bauxite, from which it is extracted, from Germany. Improvements in the processes of extraction and reduction have resulted in a decrease in price from that at which it was first sold, but one of the chief factors was the discovery of almost inexhaustible deposits of bauxite in Alabama and Georgia. According to "The Mineral Industry for 1892" the imports of bauxite in 1889 were 28,945,674 pounds. After the discovery of the Alabama deposits and mining began, in 1890, the imports were 27,503,730 pounds. In 1891 imports fell off to 17 936,504 pounds, and in 1892 a still further decline to 12,804,253 pounds, or about 44 per cent of the imports of 1889. The demand for bauxite, as in many other instances, induced mineralogists to search for It, and it was soon found. The same results are already heginning to be noticeable regarding tin.

MINERS DON'T LIKE IT.—A resident of New York, who passed nearly 25 years in the anthracite coal mines of Pennsylvaoia, says that few miners easily shake off the horror that seizes a man upon fioding himself alooe at the the hottom of a mine, with the knowledge that there is no other human heing within call. It sometimes happens that a miner, ahsorbed in his work, suddenly realizes that all hut himself have gooe. The place is as safe from ordinary accidents then as at any time, and no other living creature more dangerous than a blind mule shares the miner's solitude, but he finds it impossible long to keep off the pressiog terror, and, half ashamed, hut completely conquered, he picks up his dinner pale and gropes his way to the upper air.

A GIGANTIC SAW which has been made for the armor plate department of the Homestead mill, Pittshurg, will cut nickel steel armor plates ranging from eight to thirty-eight tons, and sometimes 29 feet long and 20 inches thick, as easily as an ordinary saw will cut a plank. It is said to have cost something like £7,000 and weighs 110 tons.

What Supervisors Can Do with Game Laws.

As reported in the *Chronicle*, Attorney F. P. Deering has filed with the Fish Commission his opinion as to the powers of Boards of Supervisors in the several counties to pass ordinances relative to fish and game. The question recently arose on accocnt of dissatisfaction caused by the new general statute, whlch makes the open season for deer from September 1st to October 15th. At that time of year in all the coast counties the deer were "running," thereby rendering their meat poor and almost unfit for food. It was desired to learn if the Boards of Supervisors had power to change the date of opening to July or August 1st without, however, extending the time during which deer may be shot in any county beyond six weeks. Attorney Deering decides that the supervisors have such power, much to the satisfaction of sportsmen in this part of California and, in fact, throughout the entire State. From the attorney's opinion it appears that such power as the supervisors have over fish and game they derive from subdivision 29½ of Section 25 of the County Government bill and from Section 636 of the penal code. These provisions are parts of acts re-enacted at the last session of the legislature. From all the provisions of law, Mr. Deering draws the following important conclusions:

"First—With respect to fish, I consider it clear that the supervisors have no power to pass any ordinance either as to the close season or as to nets and seines that is in conflict with the general laws of the State upon the subject. Section 29½, above quoted, authorizes supervisors to make regulations for the protection of fish and game, and says that when regulations are made relating to game, not fish, the laws of the State are suspended in that county. The regulations made by supervisors for the protection of game are declared to supersede the State law, but the same declaratinn is not made as to fish. The supervisors may make regulations for the protection of fish, but such regulations do not suspend or take the place of the State laws. As to fish, the local ordioances must be consistent with the general laws. The plain construction of this provision of the County Government bill is that, while supervisors are authorized to make regulations for the protection of fish as well as of game, as those regulations are declared to suspend the State law only in respect to game, they cannot suspend them as to fish. Therefore, the State laws as to fish remain in full force, and local ordinances must be consistent with them. That this was the intention of the legislature also appears from Section 636 of the Penal Code.

"Supervisors may shorten the open season for fish, but they cannot lengthen it. Again, supervisors have no power to authorize the use of a net or seine with less than a 7½-inch mesh. They must act in harmony with the State law, which makes it a misdemeanor to use for catching shad or salmon a net or seine with meshes less than 7½ inches in length. Supervisors are not given power to make regulations as to nets and seines that will supersede the State law. The only instance in which their ordinances have this effect is when they relate to the protection of game, and this is for the reason that the very law giving the power to pass the ordinance as to game says that the State law shall be there suspended.

"With respect to game, I am of opinion that to protect the game itself supervisors may make regulations which shall take the place of the State law, and, shonld the needs of the county require a longer or a shorter or a different close season, the supervisors may prescribe this also. It must be borne in mind, however, that the regulations must operate to protect the game, and that the close season can be changed only when the needs of the county require it, or when to change it would be a protection to the game.

"With respect to deer: It is part of the history of the law as it now staods, which permits the killing of deer from September 1st to October 15th, that six weeks was intended by the legislature to be the extent of the open saason, and I am of the opinion that supervisors may change this period of six weeks so as to make it begin on the 1st of July, for example, and end August 15th, if such a regulation would be for the protection of deer in that county, or if the oeeds of the county make it advisable.

"I wish to call your attention, however, to the fact that supervisors can legislate nnly for their county, and that persoos will be protected hy the ordinances only as long as they are in that county.

"It is a misdemeanor for a person to have in his possession any deer at a time when it is unlawful to kill deer. The code makes it unlawful to kill deer except hetween September 1st and October 15th. Therefore, while the supervisors of Marin county, for example, might for that county change the open season for killing deer to the six weeks beginniog July 1st, yet if any sportsman from San Francisco should shoot deer in Marin county in July and take it into Sao Francisco, or any other county where the general law had not been changed by the supervisors, he would subject himself to prosecution.

"Again, the law—Section 636 of the penal code—forbids the selling or offering for sale of the hide or meat of deer. This law the supervisors cannot change. Therefore, deer meat and deer hides may not he sold nor offered for sale; nor may deer shot io one couoty, under an ordioance permitting it there, be carried into another county where the general State law is in force."

As the result of Attorney Deering's opinion it is believed that the Boards of Supervisors of Marin and other northern counties will immediately pass laws changing the open season on deer from October 1st to July 1st. It is also likely that the opening of the quail season will be changed from September 1st to October 1st.

The Fish Commission has already placed the opinion in the form of a bulletin, which as soon as possible will be issned from the State Printing Office for general dsitribution.

GEORGE SPENCE, the superintendent of the Puente coal mioes where 16 miners were killed recently, is being tried for their murder in a Mexican court at Piedras Negras.

Mechanical Progress.

The Duplex Process.

To Americans the most interesting paper contributed to the recent meeting of the Iron and Steel Institute, which was not read, owing to the absence of the author, says *Iron Age*, was that of Paul Kupelwieser of Witkowitz, Austria, on the manufacture of basic steel at those works. Witkowitz is, we believe, the only plant runniog on the duplex process, as it has been called, so that data relating to the results there obtained may prove very valuable to those who have pleaded for the combined acid Bessemer and basic open hearth for our own South. The method at the Austrian works is as follows:

Pig iron carrying too much phosphorus for the acid Bessemer process and too little for the basic Bessemer is taken direct from the blast furnace to a 4-ton Bessemer converter, acid lined. In it the metal is desiliconized, the operation of removing o 8 to 1.2 per cent silicon taking five to six minutes. The paper does not state what the manganese contents of the pig are, but the inference seems warranted that the manganese contents are quite considerable, since the Bessemer slag is used in the manufacture of ferromanganese.

The desiliconized metal is run into the open-hearth furnaces direct, but since the blast furoaces do not furnish iron enough, solid metal is added. For the year 1892 the three open-hearth furnaces melted 1649 charges, aggregating 30,297 tons, 56.16 per cent thereof, or 17,016 tons being desiliconized liquid metal, while 36 82 per cent, or 11,156 tons was cold pig, and 7.02 per cent was scrap Sundays, holidays and stoppages for repairs kept the open-hearth furnaces idle for 22 per cent, or nearly one-quarter, of the time. The product of ingots was 28,172 tons, or 93 per cent.

Concerning the life of the converters, Kupelwieser says that over 1000 charges are often made in the same vessel, and that more than 100 blows are made on the same bottom. No specific data are furnished on the life of the open-hearth furnaces.

The fuel consumption appears to be very low, 0.16 ton of coal being required for the producers, including the heating up of the furnaces and keeping them going during repairs. The consumption of coal for the blowing engines for heating converters and ladles figures up to 0.155 ton, making the total fuel account, 0.315 ton per ton of ingots. The quantity of lime addition used is 0.0795 ton per ton of ingots, while the amount of ore used is 0.063 ton.

Mr. Kupelwieser reports that the salaries and wages figure out 4 shillings 6 pence per ton, and that the cost of the dnplex process is lower by 10 shillings per ton than the straight basic open hearth. He asserts that if it had been possible to use a larger percentage of desiliconized fluid metal the cost would not have exceeded that of making steel from a low-phosphorus iron by the acid Bessemer process.

It is, of course, impossible to judge to what extent local conditions favor the duplex process at Witkowitz and whether similar economical results are obtainable elsewhere, notably io the South. But it is certain that the duplex process is technically feasible.

Metal Ties.

Railway corporations have been severely criticised for not abandoning the present form of wooden ties and replacing them by those made of metal. The various objections to the use of wood as a material have repeatedly been dwelt upon, but the critics have not given sufficient prominence to the fact that numerous experiments have been made in this direction during a number of years with very unsatisfactory practical results. It is possible and even probable that in the recent progress of inventive enterprise means will be discovered in some future time to obviate the serious difficulties which have arisen in a practical solution of this question. One objection of particular importance to the public is that the use of metal ties has been found to notably increase a jarring motion which would cause personal discomfort to passengers. In defense of the project for this substitution it has been urged that metal is in general use for this purpose in the tropical couotries of Asia, and that if railroads necessarily conducted upon cheaper methods can introduce this improvement the custom should be promptly adopted by our wealthier corporations. The fact that the substitution is effected in tropical latitudes may be in direct proof that some of the difficulties encountered in our climate are the result of varying conditions of temperature, and the remarkable fluctuations of heat and cold. But the primary reason for the custom is that the metal tie is presented to the white ant, with the classic advice to "gnaw that file," after proving that wood is powerless to resist the inroads of the ferocious armies of that indefatigable creature.—The Railway World.

Naval Construction and Maintenance.

The recent naval parade in New York, with the considerable stay of the various vessels that participated, says the *American Machinist*, was calculated to set people thinking about many things connected with the matter of modern navies. One of these is the length of time that is required for the construction of an efficient navy, one that shall amount to very much as navies go. For example, the United States has been rather vigorously at work for 10 or 12 years, and although able to make a very creditable display, still, of course, every American knows the great superiority of the naval force of European countries, which did not, we believe, through courtesy send their heavy fighting ships to participate in the parade. If ten years, during which so much has been done, finds this country so far back in the list, how will it stand in 20 or 30 years? Probably not at the head, but from the present temper of the people nearer the head than now, at the cost of a vast sum of money. But will the people remain in the present temper when the effect of this expenditure comes to be felt?

Again, naval vessels and guns soon become obsolete. It is not a question of wearing out, it is a question of being constantly superseded by the embodiment of modern ideas in naval constrnction, and this must constantly go on. The world is continuously engaged on the problem of makiog armor plates that cannot be pierced by modern projectiles, and in making guns against the projectiles from which no armor plate is invulnerable. It is the old problem slightly modified of the irresistible force and the immovable mass. This and the desire, if not the necessity, of keeping near the head calls for ceaseless work in naval construction and the guns the vessels carry, a work that is farther from completion as the years go by.

It is easy to see the result of this. It simply means that the people who work in the production of things that enable mankind to exist, or to live more comfortably, must work the harder and fare poorer.

The men who produce the materials for great ships and great guns, and who make them and man them, must be fed and clothed, and the men who produce food aod clothing must produce for these as well as for themselves. It means so much less of all that ought to be necessary because of the expenditure for what ought not to be oecessary. This is as the moralizer reasons, but he reasons without producing any effect. We may—must—admit the truth of this reasoning, but the great nations will keep on building warships just the same and maintaining great armies in idleness.

The people will have it the way it is. Nothing causes so much enthusiasm as a parade of the things and the means of causing death and destruction. This, so far as can be seen, will always be so, and so long as it is so nations will bankrupt themselves to keep abreast of other nations.

On the principle that a thing that is worth doing is worth doing well, Americans may feel pride in the display of American ships at the parade. To be sure, we did not display the largest nor the swiftest vessels, but then we are comparatively new at the business. Time and experience are required—time and experience and a good deal of money.

There is some satisfaction in believing that the skill and ability developed by a continual study of the problems involved in naval engineering and construction may be put to useful purposes in other directions; whether it is much or little there is doubtless something in this. Tools and machines and plans that are evolved for one purpose may be useful io other directions, and knowledge is something of wide application.

Since a navy must be maintained, every one will believe in having a good one. It exercises a more civilizing effect than a poor one, and if either are of any use it is more useful. If the naval parade brought home to us more forcibly that we lacked something in speed, let more speed be the lesson of the day, and so with other things that may have been more strongly forced upon those who especially understand or are supposed to understand such matters. We are in the way of making fighting machines just now, and ought to make good ones or go out of the business.

Scientific Progress.

Electricity and Cholera.

In view of the danger of a fresh outbreak of the fatal epidemic during the year, it is to be expected, says *Electricity*, that disinfectants not only will rise enormously in price, but that the demand will exceed the production, and it will be of interest to point out a simple method for the preparation of liquids containing chlorine, the active agent of the most efficient of disinfectants, chlorite of lime. By passing an electric current through an aqueous solution of soluble chloride, both the chloride and the water are decomposed. At the positive pole a very unstable chlorate is formed, which has very powerful oxidizing propertles, while at the negative pole another oxide is formed, capable of precipitating most organic substances.

We thus obtain by electrolysis a liquid which has the following properties: (1) It completely destroys the organic substances formed by putrefaction, as well as the noxious gases generated, such as sulphuretted hydrogen, ammonium sulphate, marsh gas, etc., and it also destroys all bacilli and other living ferments; (2) it precipitates albuminous substances of all kinds, and other suspicious ingredients contained in water; in other words, it clarifies the water. This method has already been used for technical purposes, such as bleaching paper-pulp and starch, and might be used with advantage for the bleaching of our linen, which receives such barbarous treatment on the part of the laundress. Why should this method not also be used for the disinfection of refuse, water-closets and contaminated water? It would certainly be of the greatest value in case of another outbreak of cholera, and especially in seaports, provided it were properly developed and rendered applicable on a large scale. The source of chlorine in a seaport is inexhaustible; it is simply sea-water. It does not signify in the least from whence the chlorine, the most powerful of all disinfecting agents, is derived; we have in sea-water an inexhaustible supply of the raw material, and in electrolysis an excellent method for the production of the active agent.

Scientific Education Invaluable.

Information concerning the positions that graduates of scientific schools obtain is readily gained by consulting the lists of graduates usually given, with their occupations, in catalogues of the best institutions. To generalize, a scientific school of good reputation feels, in granting a diploma to a student of marked ability, that it places to his credit a fund equivalent to not less than $10,000. This statement will doubtless be readily understood, if the instance be assumed of two young men of equal ability, one of whom graduates with honor from a scientific school at the age of 22 years, while the other engages in business with no assistance except his own energy and intelligence, which is true in a large majority of instances. Within four years after graduation the youog man from the scientific school will receive an annual compensation of at least $1500.

The young man in business will meet with more than the average of success if at the end of four years he receives $3 per day for services, unless he is located in New York or Chicago. Independently, then, of the great satisfaction which any educated person derives from his attainments and the greater eojoyment of the best interests of life, which can only be appreciated by a cultivated mind, the young man who adopts a profession within three years after graduation receives an annual income of six per cent on $10,000, the difference between the annual salary and that of the young man in business. At the end of ten years those who studied faithfully while at the scientific school are receiving from $4000 to $8000 or $10,000 a year from their salaries alone, while men of equal original abilities are doing well if they can earn over $3000 without imperilling capital of their own.—New York Ledger.

Contagiousness of Consumption.

Dr. J. G. Hopkins of Thomasville, Ga., read a paper on this subject which is reported in part In the *Medical Record*. The speaker said he had joined the growing army which placed tuberculosis in the category of contagious diseases, and his experience with this disease during 19 years of investigation in Thomasville—which place is a resort for consumptives—bore him out in his opinion, and made a willing subject of the great and erudite Koch. He does not doubt but that all men, women and children, at some time or times, receive into their air passages the tubercle bacilli, but fortunately the great majority possessed the power of repelling them and throwing them off—they did not find that soil, so to speak, which is adapted to their growth. Indians in a state of nativity seemed impervious to the germs of consumption, but were now dying by thousands on the reservations. The whites and the blacks in prisons all over the world labored under similar conditions. A report from the Illinois State Prison, at Joliet, says that there are 1400 convicts within the walls, and fully one-third of them have consumption in a light or bad form. Nearly all deaths of persons in the penitentiary have been caused by consumption.

Dr. Hopkios emphasized the danger that lurks in sleeping-cars, in carpets, bedding, clothing and in the walls of apartments occupied by consumptives, which have not been properly renovated and rendered harmless by antiseptic measures. Consumptives should be forced to provide for the destruction of sputa. Whenever situated so as not to expectorate directly into a germicide or the fire, they should use some means of conveying the sputa to the germicide or the flames. If handkerchiefs or cloths are used, they should not be sent to the laundry, as human happiness and life are jeopardized through the probability of inoculation through abrasions upon the hands. These bacilli should never be allowed to dry up and impregnate the air, as is now done through ignorance of possible result. Numerous experiments by leading medical authorities have proved beyond doubt that consumption is an inoculable disease, and so rapidly is the throng of converts growing that the speaker would not be surprised if even in his day resorts now soliciting the patronage of the consumptive will be quarantining against him.

NEW USE FOR PORTLAND CEMENT.—A German inventor of Mayence has discovered that Portland cement can be used as a substitute for rubber and asbestos preparations in the packing of steam joints. From extensive practical trials this cement packing is found to be quite as efficient as the others hitherto employed, and its cost is only one-tenth that of the others. The cement is made into a paste with water and spread into a layer of one-fifth inch to half-inch in thickness over the surface of the metal. The plate or cover to be fixed is then placed in position and the screws are simultaneously screwed down very slowly. After the layer has been compressed to about one-eighth inch in thickness the screwing is stopped and the cement allowed to harden for four hours. The screws are then turned further and the edges plastered again with cement. The joint is completed in eight hours after the making of the cement. From the above it would, however, appear that the sum saved by the use of a cheaper material, such as Portland cement, is out of all proportion to the time and trouble wasted in its use.—The Sanitary Plumber.

RECENTLY powdered metallic arsenic, which, in the process of powdering, had been moistened with water to prevent dusting, is recorded by E. Hirschsohn as capable of spontaneous comhustion. A quantity of powdered arsenic in a double paper bag had been received late in the evening, and set aside overnight in a basket containing other articles packed in straw and sawdust. The next morning, upon opening the store, the peculiar garlic-like odor attracted attention to the basket containing the powdered arsenic. An examination disclosed that the arsenic had agglutinated to a solid glowing mass; that the paper bags had been charred, and that a portion of the straw was scorched; a number of bottles in the basket had also burst, owing to the high heat, and upon the charred paper bag were sublimed some beautiful crystals of arsenious oxide.

THE chemical composition of the mantle in the new Auer incandescent lights has lately been discussed. The substance deposited on the cotton web consists of the oxides of metals of the cerium and zirconium groups, which exist in various minerals, for the most part in combination with silicic acid. The oxides are extracted from the minerals, and dissolved in nitric acid. This solution forms the bath in which the cotton web is dipped, and impregnates the latter so thoroughly that, on drying and burning, a finely meshed mantle of oxides remains.

BY a simple rule the length of the day and night, any time of the year, may be ascertained. Simply double the time of the sun's rising, which will give the leogth of the night, and double the time of setting, which will give the length of the day.

Professional.

STEPHEN H. EMMENS,
Consulting Engineer and Chemist,
Youngwood, Westmorland County, Pa.
SPECIALTIES: Nickel, Tin, Dry Placer Development, Treatment of Refractory Ores, Electric Heating and Smelting.

EDMUND B. KIRBY,
Consulting Mining Engineer and Metallurgist
No. 9 Windsor Hotel Blk., DENVER, COLO.
SPECIALTY—The Expert Examination of Mining Investments and Metallurgical Enterprises.

C. A. OGDEN. W. N. JEHU.
JEHU & OGDEN,
Chemical Laboratory and Assay Office.
(Formerly Evans' Assay Office.)
628 MONTGOMERY ST., San Francisco.
ROOMS 46 and 47 MONTGOMERY BLOCK.
Ore Assays, Analyses of Minerals, Waters, all Technical products, etc., made.
Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
728 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. ☞ Send for Circular.

JULIUS H. STRIEDINGER, M. Am. Soc. C. E. OTTO VON GELDERN, M. Am. Soc. C. E.
STRIEDINGER & VON GELDERN,
CIVIL AND MINING ENGINEERS, TECHNICAL EXPERTS, LICENSED SURVEYORS.
Hereby announce that they are prepared to make the Examinations, Surveys, Technical Drawings, Estimates and Reports required by the
CALIFORNIA DEBRIS COMMISSION.
Created by an Act of Congress, approved March 1, 1893, and to represent the petitioners before the Commission.
Address: 819 Market Street,
SAN FRANCISCO, CAL.

EVERETTE'S MINING OFFICE.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
Mining Law, Mine Examinations, Metallurgy.
ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.

Patent Agency.
ESTABLISHED 1863.
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

ESTABLISHED 1866.
Pacific Chemical Works.
HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist.
718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

DEWEY ENGRAVING COMPANY,
Engravings made from photographs, drawings and original designs, for newspaper, book, card and job printing. Engraved prints enlarged or reduced, cheaply and quickly. Also copies of manuscript, legal documents, wills, contracts, signatures, portraits, buildings, machinery and printed documents reproduced with accuracy. Photographs, stereoscopic views, etc., duplicated, enlarged or reduced. Slides for magic lanterns made from photographs lithographs, and steel or wood engravings, etc. Satisfaction guaranteed. Agents wanted in all cities and in all towns. Address, for further information, DEWEY ENGRAVING CO., 228 Market St., San Francisco.

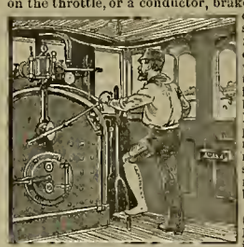
Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco
GOLD AND SILVER REFINERY And Assay Office.
Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.
—MANUFACTURERS OF—
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges.
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.C.° BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

ARTIFICIAL LEGS AND ARMS
WITH RUBBER FEET AND HANDS.
It is not unusual to see an engineer with hand on the throttle, or a conductor, brakeman, fireman, carpenter, mason, miner, in fact men of every vocation, wearing one or two artificial legs with rubber feet, Marks' Patents, and performing as much labor as men in possession of all their natural members.



Over 14,000 artificial limbs of Marks' Patents in use. Purchased by the U.S. and many foreign governments. One-half of the limbs furnished by us are made from measurements without our seeing the wearers. Fit guaranteed. A treatise of 430 pages, with 260 illustrations and a formula for measuring sent free. Address,

A. A. MARKS, 701 Broadway, New York.

C. H. EVANS & CO.,
(Successors to THOMSON & EVANS.)

Electricity.

Economy of Small Lighting Stations.

In an article on this subject. Lieut. James B. Cahoon, in the *Electrical World* says:

Let us take two small country stations and see wherein they differ. Take one in the State of New York, the other in the State of Vermont; the first one being run on the false economy, the latter one of the rejuvenated stations. These two stations are not many miles apart, and the services of an expert has been necessary at each within tbe past year. We will describe each in detail as far as possible, taking the New York one first. There were two lots offered for the station, one of whicb was near the center of the town and alongside the railroad track just at the end of one of the sidings. The price of this was about three times what they could get the other lot for, which was situated on the outskirts of the town, back about half a mile from the railroad track; hut as they got tbe lot cheaper they decided to take it. As they had saved quite a little in this way, it was determined to put up a fairly good building, and therefore a brick building was erected under the supervision of the vice-president of the company, who had had some experience in building. As the station was in an out-of-the-way place, only the cheaper grades of brick were employed in its construction, and a dry stone foundation used, which was pointed up on the inside. Although they would have to use some 400 or 500 h. p. in order to furnish the town and their customers with light, it was thought best to purchase only one engine, and therefore provision was only made for this, and a foundation some five feet in depth was made of rubble, with a top of three courses of brick. It was not deemed necessary to provide foundations for the dynamos, as none of them would be of any size, but an extra tbickness of two-inch planks was put down where the dynamos and jack shaft were to be situated. The boiler house was not separate from the station, but occupied one end. Cement foundations were provided for the boilers, and in front the earth was leveled off, forming an nrdinary dirt flonr. In order to get the light at the end windows, the boilers faced toward the outer wall. The engine was placed at the other side of the partition, back of the boiler. The ordinary high-pressure is used, exhausting into the atmosphere. No provision is made for heating the feed water, which is pumped in cold. The steam pipe leading from the steam drum makes four rightangled turns by the time it gets to the engine, the latter being of a well known make and capable of doing good service. The boilers were also good of their kind, and the electrical apparatus was first-class and was well installed at the station. The company decided, bowever, to let ont the contract for putting up its overhead lines to a local contractor, who made a fairly good job of it, doing his work as well as he knew how, but was compelled to use cbeap wire and cheap poles in his construction on account of the kind of wire and poles beiog specified in his contract. After all was finished, the son of one of the directors was put in as superintendent and business manager, with an electrician and chief engineer at a salary of $75 per month. His lamp trimmers, of which he had three for something under 200 lamps, did not receive very much pay because they did not have very much to do, as they only had between 55 and 60 lights apiece to trim.

As near as could be figured, subsequently, the boilers used about five pounds of ordinary soft coal per horse-power. There was no means of determining what the evaporation of the boilers was, i. e., how many pounds of water per pound of combustible. The first year quite extensive repairs had to be made on one of the boilers, owing to the crown sheet having burned through, due to the carelessness of one of the firemen in letting the water get too low; and the armature of an arc machine, whicb was designed for 50 lights, had to be twice replaced on account of overload, the superintendent boasting he could get 80 lights out of it, and usually did so, having at one time, he said, run as high as 85 lights. At the end of the first year the plant showed an apparent dividend of a little over five per cent on tbe investment, the next half year showed an increase in repairs which had to be made on the engine, the line kept giving trouble from frequent grounds, the insulation dropped off the wire, and so on. From that time on the plant has never shown a dividend of over 2¾ per cent.

(*Continued next week.*)

INTENSE HEATING BY ELECTRICITY.—Messrs. LaGrange and Hoho, of Belgium, whose process, for heating metals to a white heat by the passage of a strong current through an acidified solution, have suggested by their discovery the possibility of numerous applications of the result of their combined obserrations; and it is probable that in a very short while we will hear of new inventions based upon this heating process. It is not altogether an unexplored field, that of heating by electricity, but the simple manner in which tbis localizing of the heat is accomplished makes experimenting in this particular direction enticing and interesting. Come, inventors, get to work and let us see what you can bring forth?—Electrical Review.

The Trolley in the Road.

Under the above caption, the Philadelphia *Press* says:

The accidents which have occurred on the trolley road running between Media and Chester, in Delaware county, show that even on suburban roads a high rate of speed cannot be maintained without great danger. It is possible to run trolley cars from 15 to 20 miles an hour, possibly more, but such speed on a thoroughfare that is used for any other purpose must result in many accidents.

The occupation of country roads by trolley lines is likely to prove a great convenience in many respects. It will bring into closer relations the suburban commuoities, and open to settlement desirable parts of the country which have been inaccessible. The trolley is the best means of transit now available for that purpose, and it will accomplish a good deal until there is something better to take its place. But the trolley on the country road has its disadvantages. For considerable distances along some of the lines there is something of a rivalry with steam roads, and the disposition to compete with them has resulted in a dangerous rate of speed.

Experience has already proved the need of some strict regulation to it, that the danger of accidents may be reduced to a minimum. The public still has a right to the country roads as to the city streets, in spite of trolley lines. How much regulation is to be secured is not so plain. Neither township nor county authority to act upon such a matter is very well defined, there being no such legislative bodies as in cities and boroughs. The most forcible restraint in such a case will doubtless be the damage costs which are pretty certain to be assessed upoo the companies responsible for loss of life and destruction of property. With all this, however, the speed of the trolley car on public roads is very likely to command the attention of the next legislature. By that time there will have been enough experience with it to know just what is needed.

In cities and boroughs the local authorities can regulate the matter as promptly as they desire. Because we want rapid transit, and the trolley cars can be run 20 miles an hour, or more, it is not made practicable to run them at that rate. In fact, on the city streets—tbe streets of Philadelphia for instance—it will be impracticable to run tbe trolley cars much, if any, faster than horse cars have been run. No one can pretend that they are to furnish the rapid transit which this great city must have in the early future. We shall get larger cars and cleaner, because they will be new, and we hope to get more of them, but there can be but little faster traveling than at present.

Accidents on suburban rnads, due to higb speed, are much less likely than in the streets of a city. Bnt they do occur. There have been enough of them to prove the danger of trying to accomplish the speed of the steam roads on a surface used also for road vehicles and pedestrians. Grade crossings are bad enough. This is likely to prove worse.

Electric and Steam Railroads.

Electric railways were originally introduced as a substitute for horse cars in town and city traffic, and the promotors of the first lines saw little further occasion for them. But in an exceedingly short time their field of usefulness has broadened, until they are even now in many States a successful rival of steam railways for passenger traffic over lines of considerable length. Their relative cheapness of construction and ease of operation well adapt them for use in connecting centers of population and business with outlying towns and suburban districts, and this is being done all over the country. Brooklyn already has a system of electric railways stretching far out into Long Island, and tieing to it the number of small villages to the eastward. Newark, N. J., is in a similar manner reaching out for neighboring towns, and a line now building from Yonkers. on the Hudson, to New Rochelle, on Long Island sound, will connect the several considerable towns on its route and make more accessible the many desirable building sites in that part of Westchester county. Lexington, Ky., is also contemplating the construction of at least two electric lines which would connect it with Paris, the county seat of Bourbon county, 18 miles distant, and with Versailles, the seat of Woodford county, 15 miles away. The avowed object of the projectors is to induce the farmers to come to Lexington to make their purchases. In Pennsylvania a projected electric railway would parallel the main line of the Pennsylvania railway between Philadelphia and Lancaster, a distance of 70 miles; and those who are asking for the charter believe that the frequency of service and stops and the ease of getting at the cars will divert sufficient passenger traffic from the steam railway and encourage others to travel who use the existing line very little. A similar project in Illinois proposes a line right across the State from east to west, cutting present steam lines, and in this case serving as feeders to them. These few amoog the many electric railway enterprises already started In the United States show a rapidly-growing appreciation of the advantages of the system as a means of affording rapid and convenient transit to country districts, and in most cases they will serve as feeders to steam railways runniog through the sections thus improved, and tend to increase general traffic. The one thing yet wanting in these lines, as far as we know, is a service which includes the transportation of baggage and more valuable and compact parcels of goods. The suburban electric line that includes this service will well earn the gratitude of its patrons and make money besides, for a convenience of this kind will greatly advance the desirability of the region traversed as a place of resideoce, and thus increase the short-haul traffic, the most profitable traffic to the company.—Engineering News.

Useful Information.

Camels in Australia.

Although the camel proved unsatisfactory for use as a beast of burden in the mining regions of Nevada and Arizona, the animal is rapidly coming into favor and profitable use in mioing countries in other parts of the world. It seems probable to the mining iodustry that in south Africa the camel will take the place of the horse for most uses, as the camel is not injured by the insects which prove fatal to the horse and the bullock, nor is it attacked by the diseases that destroy other beasts of burden.

The Germans are already making great use of the camels in southwest Africa. They are found to be very valuable for making long journeys ioto the arid interior regions of the country, as they are able to travel a whole week without water or food. In Australia the camel is fast taking the place of bullocks for use in the barren interior regions. It is stated that there are already opened up and in regular work in Australia five lines of camel traffic, and that on these lines over 2000 camels are in daily use.

Camels are found to be so useful that the number employed will be increased as rapidly as possible. With bullock teams only about 10 miles a day can be made, but it is found that the camel will travel 84 miles in 18 hours, carrying a load of 300 pounds. In the ioterior of Australia are 1,000,000 square miles of almost unknown desert, and it is on the great inland plains that it is intended to utilize the camel trains, as by their use the various oases of civilization may be more directly connected than by the old bullock routes. On the arid plains and among the mud flats and brackish lakes the camel finds plenty of coarse grass and thorny shrubs on which to subsist. It is claimed that work can be found in Australia for 1,000,000 camels.—Public Ledger.

RUBBER TESTS.—Lieut. L. Vladomiroff, a Russian naval officer, has recently carried out a series of tests at the St. Petersburg Technical Institute with a view to establishing rules for estimatiog the quality of vulcanized india rubber. The followlng, in brief, are the conclusions arrived at, recourse being had to physical properties, since chemical analysis did not give any reliable result: 1. India rubber should not give the least sigo of superficial cracking when bent to an angle of 180 degrees after five hours of exposure in a closed air bath to a temperature of 125° C. The test pieces should be 2.4 inches thick. 2. Rubber that does not contain more than half its weight of metallic oxides should stretch to five times its length without breaking. 3. Rubber free from all foreign matter, except the sulphur used in vulcanizing it, should stretch to at least seven times its length without rupture. 4. The extension measured immediately after rupture should not exceed 12 per cent of the original length, with given dimensions. 5. Suppleness may be determined by measuring the percentage of asb formed in incineration. This may form the basis for deciding betweeo different grades of ruhber for certain purposes. 6. Vulcanized rubber should not harden under cold. These rules have been adopted for the Russian navy.

Ways to Injure Health.

Givlng way to fits of anger.

Leading a life of unfeeling, stupid laziness.

Contriving to keep up a continual worry about something or nothing.

Beginning in childhood on strong tea and coffee, and going from one step to another, through chewing and smoking tobacco, and drinking intoxicating liquors.

Allowing the power of gain to absorb our minds, so as to leave no time to attend to our health; following an uohealthful occupation because there is mooey in it.

Tempting the appetite with bitters and niceties when the stomach says no, and by forcing food into it when nature does not demand and even rejects it; gormandizing between meals.

Marrying in haste and getting an uncongenial companion, and living the remainder of life io mental dissatisfaction, cultivating jealousies and domestic broils, and always being in mental ferment.

Surfeiting on hot and very stimulating dinners; eating in a hurry, without half masticating the food, and eating heartily before going to bed, when the mind and body are exhausted by the toils of the day and the excitement of the evening.

Why a Cemetery is So Called.

Webster says a cemetery is "a place where the dead bodies of human beings are buried." But that is all he says, and there is not a five-year-old child in the land that could not tell as much without referring to his "uoabridged."

In tracing the derivation of the word, I find that the root is an old Jewish word, "caemeteria," meaning dormitories, or sleeping places. Later on, the form of expression was changed to "requietorium." In that section of "Camden's Remains" which has the heading of "Concerning British Epitaphs," I find the following (page 385, edition of 1650): "The place of burial was called by St. Paul 'semeoatoria,' in the respect of a sure hope of a resurrection." The Greeks call it "caemeterion," which means a sleeping place until the resurrection. The old Hebrew word for cemetery means "the house of the living," the idea being that death is only a protracted sleep that will terminate on the day when Gabriel blows his trumpet.—St. Louis Republic.

A Hammock Idea.

A young woman who lives in a small New York hotel, and has only one room, had a gift lately of a Guayaquil hammock—one of those great, gaily-colored webs that gives so delightfully. It seemed an odd present to a woman who hardly saw a veranda from one year's end to the other, but if she hasn't verandas she has ideas. She had hooks put in opposite corners of her room, and when she wants to deliciously lounge she swings the hammock from them. When it is not in use it is draped by means of a third hook across one entire side of the room, making, with its fringes and tassels, a brilliant wall decoration. Mary Hallock Foote says somewhere that an American back never learns to adjust itself to the luxury of a genuine South American or Mexican hammock. The owner of this one says she has learned more of the real theory of rest since she owned it than she ever knew before. "Since I learned to let go and siok," she said, "I have gained five pounds."

COST OF CARS.—A flat car costs about $380, a flat-bottom coal car $475, a gondola drop bottom $500, a double-hopper bottom coal car $525, a double-hopper bottom coke car $540, a box car $600, a stock car $550, a fruit car (ventilated) $700, and a refrigerator car $800. A four-wheeled caboose costs $550, and an eight-wheeled one $700. The prices given oo the above cars include power brakes and vertical-plane couplers. A 50-foot mail and baggage car $3500, a secood-class coach $4800. first-class coach $5500, while a first-class Pullman car costs $15,000.

THE number of sawmills in Washington is 456; Oregon 461; Idaho 114; Montana 70. Shingle mills in Washington, 212; Oregon 26; Idaho 8; Montana 5. Sash, door and planing mills in Washiogton, 56; Oregon 58; Idaho 10; Montana 16. Number of loggers in Washington, 17; Oregon 4; Idaho 10.

Water Purified by Iron.

The filthy water of the river Nethe is purified for use in Antwerp by being passed through revolving cylinders containing small pieces of iron. Fifteen pounds of magnetic iron will purify 1,000,000 gallons of water. The water thus treated is said to be completely free from germs, bacteria, and other objectionable matter. English and French chemists find that the contact with iron reduces the organic matter by from 45 to 85 per cent and albuminoid ammonia by from 50 to 90 per cent, and all free ammonia is removed. The process has been applied with success to the water of the Delaware river in Pennsylvania. It is simple and cheap. From all of which it may be inferred that the passage of drinking water through iron pipes does not injure it.—Baltimore American.

RAILROAD CROSS TIES.—There are in use in the United States not less than 550,000,000 railroad cross ties. The average life of a cross tie is put at five years on main lines. This would require for annual renewals alone, not counting new extensions, 101,000,000 new ties. The life of cross ties used on side tracks is much greater, but the average cannot exceed six or seven years, and at the lowest estimate 80,000,000 to 90,000,000 new ties will be required annually. This will require about 2,500,000,000 feet, board measure, of the best lumber.

WEEKLY EXCURSIONS!

Are you going? If so, call on or write to the undersigned before arranging for your trip. The "SANTA FE ROUTE is the only line under one management from California to Chicago! Palace and Tourist Sleepers through to Chicago every day without change! Excursions every Tuesday. W. A. BISSELL, G. P. A., 650 Market Street, Chronicle Bldg., San Francisco, Cal.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horsepower Engine and 45-horsepower Boiler with Ore-crusher and other machinery, Mill Screen, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPY, 1914 Stockton St., San Francisco.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

BARGAINS IN SECOND-HAND MACHINERY.

ONE 2-H. P. BAXTER ENGINE.
ONE 3-H. P. VERTICAL ENGINE.
ONE 4-H. P. VERTICAL ENGINE.
ONE 6x12 EVANS DEEP WELL STEAM PUMP, with 4-inch double-acting cylinder, 100 feet of pipe and well rods, all fitted.
ONE TRI-PLEX KROGH PUMP, with tight and loose pulleys 48 inch diameter, 6-inch face.
ONE FINISHED FLAT-RUN BALANCE WHEEL, weight 700 lbs

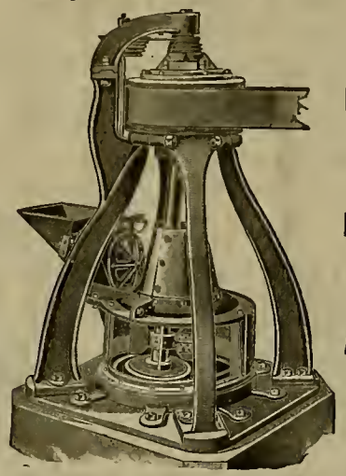
One Ohmen's 12 x 12 Automatic Engine; best style in use. Also, 1 Boiler 48 in. x 16 ft. Both nearly new. Apply to J. W. QUICK, 221 First St., (Top Floor) San Francisco, Cal.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

THE GRIFFIN MILL

The Only Perfect Pulverizer

OF QUARTZ, GOLD OR SILVER ORES, PLUMBAGO, PORTLAND CEMENT,



OF PHOSPHATE ROCK, FOUNDRY FACINGS, And All Other Refractory Substances.

Will work either wet or dry, and deliver a finished product. Capacity, 3 to 4 tons per hour on Phosphate Rock, 1½ to 2 tons per hour on Portland Cement, Quartz or Ores, depending on hardness of material to be pulverized and fineness of product. Grinds from 30 to 250 Mesh with equal facility.

NO JOURNALS IN GRINDING CHAMBER. BALL RIGID ON SHAFT HAVING DIRECT POSITIVE ACTION ON MATERIAL. MINIMUM POWER PRODUCES MAXIMUM AMOUNT OF PRODUCT. IT IS ABSOLUTELY GUARANTEED IN EVERY RESPECT, BOTH AS TO CONSTRUCTION AND CAPACITY. FIRST COST, WEAR, AND OPERATING EXPENSE MUCH LESS THAN STAMP MILLS. LARGE NUMBER OF MILLS IN USE ON DIFFERENT MATERIALS WITH POSITIVE SUCCESS IN EVERY INSTANCE.

Correspondence solicited, and illustrated descriptive pamphlet furnished on application to

BOOKS ON ASSAYING

BY C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes where of he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

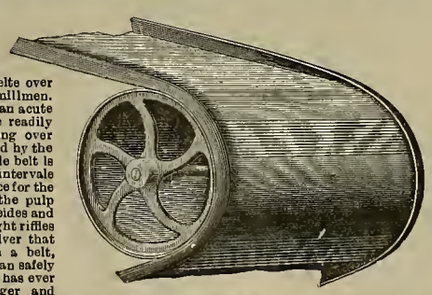
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

FROM IRMAVILLE.—Cor. Amador *Dispatch*, June 24: Great excitement was created in this new town over the fact that the workmen in the mine belonging to Sheriff Gregory and Manager Shea, of the Irma, had struck the ledge two feet wide which prospects over $20 to the ton. At the Humboldt mine there is a respectful pile of ore on the dump which will be crushed next week. This is the third crushing from this mine in three months. At the Modoc mine a steel horse-power whim is being erected, and sinking will be commenced at once. This has in the past been a good paying property, and the owner has great hopes of its continuing to be so in the future. The Newcastle Mill and Mining Company has started to open out the Lone Willow mine under the superintendency of Charles Gracey. The Irma Mining Company has put in its new steam plant and set in place its new direct-acting Cornish pump, and the water has all been pumped out of the mine. It started up the mill on Tuesday, and the mill is running night and day. Thirty-eight men are now at work, and the force will be increased to fifty before the end of the present week. Milton Bearce is taking out good rock out of his tunnel next to the Irma property, and intends to have a crushing soon.

TO RESUME.—The New York mine, which has been lying idle for several months, is expected to resume active operations very soon on an extensive scale. There is a very large body of low-grade ore in this mine that can be worked to good advantage with the proper kind of machinery, and its successful working is only a matter of a short time, as the owners are all energetic men and are not afraid to put a few dollars into good machinery. It will, however, be necessary to sink about 100 feet deeper before work can be carried on to any great advantage.

Butte.

FORBESTOWN.—Oroville *Mercury*, June 26: W. M. James, superintendent of the famous Uncle Sam mine in Shasta county, who has for some months been looking at the mines in Forbestown has completed a bond of the quartz property of L. K. Reasoner, situated about one mile south of Forbestown. Mr. James represents one of the wealthiest English mining syndicates in the west, the same company owning and operating the Plumas-Eureka mine at the Sierra Buttes and the Uncle Sam mine in Shasta county. They control unlimited capital and will, under the bond, and at once commence development work on the lode. This mine is known to be rich, and the transaction undoubtedly means the erection of another great mill with all its advantages to eastern Butte.

Calaveras.

WORK RESUMED.—Calaveras *Chronicle*, June 24: Wm. Caldwell, Esq., owner of the Caldwell mine, located in Wet gulch, near Jesus Maria, arrived from San Francisco, Wednesday evening, prepared to commence operations at his mine. This property has not been worked since the heavy rains of last winter. Now that the weather is fine, Mr. Caldwell has determined to retimber the mine in a substantial manner, sink the shaft 100 feet deeper and run levels each way on the lead. Daniel Ross was employed as foreman and started for the mine Thursday morning. Under the able management of Mr. Ross, we expect soon to chronicle good news from the property. The former workings of this mine were very profitable to its owners. All the rock was hauled to mill some 12 miles and paid in the neighborhood of $40 per ton. The late workings have paid $16 per ton, as milled in a small prospecting mill, not more than one-half of the gold being saved. The Mauna Bros. own the extension of this mine and have a large body of good rock in sight. We are pleased to see Mr. Caldwell return, and, with his accustomed vim, are confident that the entire Jesus Maria district will be benefited, which of course means help for our town.

El Dorado.

MILL STARTED.—El Dorado *Republican*, June 27: The repairs on the mill at the Oro Fino mine were completed this week and the mill started, a head of water being got through from the Park canal. There are about 40 men now employed and work is being pushed in the shaft and drifts with air drills operated by two engines, the hoisting being done by a third. There are about 300 tons of ore on the dump ready for crushing. Grading is being done for the chlorination works. The same company is also cleaning out the shaft on the Fort Yuma mine, with the intention of prospecting it. H. G. Hulburd's five-stamp mill near Butte Flats is running on ore from the mine and will continue till the dump is exhausted. The vein is small and it is not likely that enough can be taken out to keep the mill running steadily. Power is furnished by 15 inches of water applied to a Knight wheel. Good results are being obtained from the run, it is said.

Humboldt.

PRESTON IRON MINE.—Blue Lake *Advocate*, June 24: The *Advocate* acknowledges a pleasant call Thursday from Mr. Frank Horton of the Pittsburg Iron Company, the corporation which has recently leased the Preston iron mine on Janes creek. There is a temporary cessation of work at the mine pending the arrival from the East of another member of the company, who is expected to reach Humboldt shortly after the Fourth. Mr. Horton informs us that he is down only about 20 feet so far, and that water is running in at such a rate as to preclude the possibility of a continuance without hoisting works, and that, as this machinery is expensive, it will not be put in until after the arrival of the gentleman expected from the East. We are informed that it is too soon yet to determine whether the vein is extensive enough to justify the erection of smelting works, but that when they reach a depth of 100 or 125 feet, they will be able to ascertain with reasonable accuracy how extensive it is. If, upon reaching that depth, the indications are what they believe they will be, a smelter is to be put up immediately. The ore (red hematite) is as rich, Mr. Horton assures us, as could be found anywhere else in the United States, and assays all the way from 60 to 80 odd per cent iron. The lease is for a period of 30 days, with privilege of 40 years, so that the company has all the time it wants.

Inyo.

A SUCCESSFUL PROCESS.—Inyo *Independent*, June 23: The leaching process of working ore has not been much practiced here, but Andrew Fyfe is making a success of it at the Montezuma mine. After the furnace at Elna was burned, about eight years ago, work at the Montezuma mine was stopped. During the time the mine had been worked much ore had been thrown in the dump, because it was fine, like sand or gravel. This is the ore that is now being leached. Mr. Fyfe experimented with the ore till he was satisfied money could be made by leaching it, and then he got a small plant and went to work. The principal part of the plant is tanks, and with three got at the brewery here, Mr. Fyfe has now enough to work 12 tons of ore each day. The ore carries from $8 to $30 gold, and from 18 to 20 ounces silver per ton. None of the lead is saved, and of this the ore carries 28 per cent. The ore at the dump is first screened, to get rid of all that is reduced to condition of dust, as this would pack too solid to permit the liquid to leach out the metal. From the size of wheat up to the size of beans is found to be the most favorable for leaching. The concentrates obtained by leaching are worth from $1600 to $1800 per ton. These will all be shipped to Salt Lake for reduction. Hyposulphide of soda and a very small portion of sulphate of copper are the chemicals used in leaching. Mr. Fyfe says these cost about 50 cents for each ton of ore worked. On the dump there is now at least 2000 tons of ore ready for working. In the mine is plenty of ore in sight, and when the dump shall be exhausted a crusher will be erected to reduce the ore taken from the mine to a proper condition for leaching. Several years ago Sheriff Gorman, who was then working the furnace at Swansea, smelted 300 tons of ore and got substantially the same returns of gold, silver and lead that Mr. Fyfe gets from it. Mr. Gorman still has the records kept when he smelted the ore, and these show returns as stated.

DULL.—Inyo *Index*, June 24: Times are dull—very dull—in this section, and there appears no early prospect of improvement. The home market which the silver mines afforded is nearly gone, as few mines are being worked, and even these on a reduced scale. With present transportation facilities, there are very few articles of production that can stand the expense of shipment.

Mono.

STARTED UP.—Bodie *Miner*, June 23: The Standard mill and mine started up on Sunday, having been closed down for a month and a half on account of lack of wood. The electric plant has been completed and will be in operation in a short time, but until electricity is used the mill will continue to be run by steam.

THE WARD.—A capitalist from Sacramento is expected to arrive here in a day or two to examine the Ward mine at Green creek. If the representations that have been made to him as to the value of the property are correct he is to purchase one of the claims for $16,000, and a stock company will be formed to take hold of it and work it a thorough and systematic manner. Thos. Ward, the owner, has about 80 tons of ore out now, and should the sale not be consummated he will run this through the five-stamp mill which he purchased in Bodie and moved out to Green creek last fall. A small run was made last fall which netted Ward about $46 per ton.

Nevada.

ANOTHER NORTH STAR DIVIDEND.—Grass Valley *Union*, June 24: Another dividend of 50 cents per share has been declared by the North Star Mining Company of this city, payable immediately. The amount payable aggregates $50,000, and the total amount of dividends so far paid since the reopening of the mine a few years ago amounts to $450,000. December of last year and March of this year dividends were declared, making $150,000 within six months. The mine is looking better than ever, and the company expects to be able to pay dividends regularly every quarter. Since Superintendent Abadie took possession five years ago, the mine has continued to improve. By economical management it is free from all debt and has paid to its stockholders the magnificent sum above mentioned. It is a noticeable fact that all the dividends declared have been under Superintendent Abadie's management, the first one being on July 11, 1888.

THE LUPIN STRIKE.—*Transcript*, June 23: The strike made at the Lupin gravel mine this week is regarded as the most important yet made on the Washington ridge, for the reason that it demonstrates beyond a doubt that the gravel channel extends up the ridge. The gravel found is of the same character as that found in the Harmony, West Harmony, Fountain Head, Cold Spring and Manzanita mines, although the gold is somewhat coarser. It is about ten miles from the Harmony mine to the Lupin. The channel evidently runs all the way, and although it may not all be rich, there is good reason to believe that paying gravel can be found nearly all the way. The gravel in the Lupin where the strike was make pays from $1.50 to $2 per pan. The owners of this mine are D. O. Williams, Hon. John Caldwell, F. T. Nilon, George Gehrig, all of this city, George Mainhart, E. W. Donnelly, Thomas Pearce, of Grass Valley, and another party whose name we do not now recall. From all indications it looks as though they had a big thing. We expect to hear of several new locations in that vicinity before a great while, and to note increased activity in work in all the drift mines already in operation along the ridge. Messrs. A. Isoard and Fred Zeitler, of this city, will visit that section in a day or two to see about buying or bonding one of the gravel locations there. If they do not succeed in this, they will probably make a location of their own.

LOOKING WELL.—*Transcript*, June 17: The mining outlook in Nevada township was never brighter than it is at the present time. More prospecting is being done than at any one time in years past, and in most cases the results obtained are very encouraging. With perhaps one exception the old developed mines are looking as well as ever and keep their regular crews of men at work. It is said that within a few days two mines in this vicinity will be sold to San Francisco capitalists and that the purchasers will at once have machinery put up for the systematic working of the properties. Both mines have been worked in a superficial manner for a number of years, but the owners have not been financially able to do any systematic work. It is believed that good mines can be developed there. The Reward mine, situated on the ridge above Deer creek and near the Rifle Grounds, is a new venture, but sufficient prospecting has been done at different points on the ledge to convince the owners that there is a good mine there and all that is necessary is to open it up. With this object in view a hoisting and pumping plant is being erected, capable of working to a great depth. The building is about completed and the machinery will soon be put in. A large two-compartment incline shaft is being sunk. R. C. Walrath and Jos. Thomas are the principal owners of the Reward. The old Sneath & Clay mine, situated on Gold Flat, was sold some time ago to a company of San Francisco capitalists, Lord Housman of this city retaining a good interest. The company expects to resume operations before a great while. It has been years since any effective work was done at this mine. Twenty-five years ago it was one of the richest and best-paying mines in the State. The two original owners, Sneath and Clay were made rich from it. Through mismanagement and misunderstanding the mine was closed down, and although the property has since been bonded to different parties, no work of any consequence has been done there from that day to this. It will take money to get the mine open again, but mining men who know the full history of the Sneath & Clay believe that there is plenty of rich rock there yet. Work will be pushed ahead on the Coan quartz mine, Indian Flat, which was lately bonded to R. R. Colgate, the well-known soap man of New York. A pumping and hoisting rig will be put up right away, and the shaft increased in depth. The Murchie mine was bonded some time ago and the bond expires soon. If the parties to whom it was bonded do not purchase, other parties stand ready to take it. This is believed to be a good piece of property by the miners who worked there when operations were suspended. The Federal Loan is one of the quartz mines that has come to the front during the past two years. A fine ledge of good quartz is being worked, and the mill is kept running night and day. Everything about the mine is done in a systematic, economical manner. The property is increasing in value all the time and is considered one of the most promising around here. There are several other mines in the Willow Valley district that are looking well and from which rich developments are expected. The Nevers west will be opened up some day. Rock which assayed as high as $700 per ton was taken from this ledge several years ago. The owners are without the capital necessary to properly develop the mine, but monied men will doubtless get hold of it before a great while and make a paying property of it. Lyons, Postelwaite and others have a fine prospect at Willow valley and have taken some very rich rock from their ledge. We learn that the old Hussey mine, which was worked some years ago, is soon to change hands and will be worked again. The Fountain Belle mine continues to look well, and good rock is being taken out right along. Only prospect work is being done. The Midnight mine, situated on Piety Hill, owned by Edwin Tilley and others, will be started up soon. Prospecting work is going on at the Charonnat mine, Canada Hill. A company of Colorado mining men are talking of buying this mine. The Mayflower, at Canada Hill, is holding its own. Fine rock is being taken out right along. John and William Kistle have resumed work on the Green Mountain ledge, near the Murchie mine. They have been prospecting this ledge off and on for some time. Prospectors are at work in all directions. When the sales of mines above referred to are made there will be a big increase in the number of miners employed hereabouts and still greater activity in all branches of business.

GOING TO APPLY FOR A LICENSE.—Grass Valley *Union*, June 23: The indications are that all the owners of the larger mines will take the necessary steps to procure licenses to resume hydraulicking, and it is believed in all cases licenses will be granted, for the reason that the law will be strictly complied with. Yesterday W. W. Waggoner, of Nevada City, went to Smartsville for the purpose of making a survey for a dam for the hydraulic miners in that section. The impression is very strong that the old mines which have been closed down for about 12 years will resume operations much sooner than the people generally had any idea they would. When these do start up there will be booming times in Nevada county, which is affected by the stoppage more than any other county in the State.

WILL START WORK.—Grass Valley *Telegraph*, June 27: The Board of Directors of the Lone Star Mining Company held a meeting to-day and decided to immediately send men to the claim to work. The tunnel will be thoroughly repaired and work will be pushed forward as rapidly as possible. The stock in the Lone Star is owned mostly by Grass Valley people. The mine is situated in the Gold Lake region in Sierra county.

Placer.

MAYFLOWER.—Colfax *Sentinel*, June 23: The Mayflower is running full blast. The Mammoth Consolidated Mining Company have their contract just about finished. It was let some time ago to Wm. Burns, to run 200 feet of tunnel through the gravel to tap the main channel and he is now within a few feet of finishing it.

YANKEE JIMS.—While at Yankee Jims the other day we saw a prospect taken from the "Ben Franklin" mine that reminded us of the fact that Yankee Jims district is not yet worked out. Out of a single pan of dirt Mr. Burke secured $70 in coarse gold, the sight of which was enough to make a newspaper man's mouth, also eyes, water, and to stir up within him all the covetousness of his soul. The prospect shows what yet lies hidden in some of our mining districts that are considered effete. Some day we will be chronicling the developments of larger operations in this old-time district.

Plumas.

ON THE NORTH FORK. — Plumas *National-Bulletin*, June 22: While the mining interest on the North Fork has not been very prosperous during the past few years, yet at the present time events point to a revival of that industry. The most notable development of late is in the King drift mine, owned by Fred Scott. It is situated near the lower end of Big Flat and is tapped by means of a 250-foot tunnel driven into the mountain about 250 feet above the bed of the North Fork. A big channel has been discovered and the gravel therefrom yields good returns. When we arrived at the mine Mr. Scott, Sr., was just finishing cleaning the product of four pans of gravel taken by him from the mine. The gold weighed $2.15. Mr. Scott is pushing development work on this property, and will soon employ quite a force of men. Immediately above the King is the Glenore, also owned by Fred Scott and others, the two mines covering one-half mile of channel up to the Cameron drift mine. Angus Cameron is continuing work in his gravel mine. His tunnel is in 780 feet, but no channel has yet been reached. He is now making an upraise about 400 feet from the mouth of the tunnel to prove whether he has passed the channel or not. In tunnels, upraises and drifts, Mr. Cameron alone, except a few months, has tunneled in this mine nearly 1500 feet, but he goes bravely ahead in search of the rich deposits of gravel which he is confident lie above or in front of the present works. Certainly it is there, for it is found in the King below and in the Glazier above. The Glazier, the Cameron, the Glenore and the King would make a big mining proposition for a company with means to develop it, controling four miles of channel proven to be rich at both ends. At Dutch Hill the Savercools are running a tunnel for development purposes. Duryea & Savercool have started work on the Kirkham claim. Geo. Scott and John Hickerson have good prospects in gravel on the eastern side of the North Fork opposite Marion Flat. James Firmstone is sinking an incline near Malvern Hill to develop a channel. His prospects appear to be good. Dick White is preparing to resume work in his mine, which has proven to be one of the best on the river. There are many other small mines operating in that section.

FOR THE SHENANDOAH.— *National-Bulletin*, June 24: The first shipment of freight over the Oroville road this season reached Spanish Ranch on Sunday. Two heavily loaded wagons, consisting of mining supplies and implements, in charge of George Maurer, for the Shenandoah's Company's mine in French Ravine, near Rich Bar, go forward to-day. In this connection it is worthy to note that Mr. Maurer, whose indomitable energy is well known, was the only teamster in the Foothills who would undertake the transportation of freight over the snow belt at this time. He has heretofore done all the company's freighting. The undertaking was one involving great skill, hard work, and withal much more perseverance than is ordinarily found in one man.

Captain J. W. Smith of Oakland, the general manager of the Shenandoah Q. M. Co., a man who has reached the age of 77 years and who is now performing what he terms his last missionary work in gold mining, also crossed the snow belt in a buckboard, alone, driving one horse, reaching Spanish Ranch Saturday, in good condition, in advance of the freight team.

NICE GOLD.—On Thursday, at Crescent, we saw the neat little sum of $600 in quartz gold obtained by Cook and Kuhlendorf from their placer mine between Soda creek and Curtis ravine, the result of work there during the season just closed. Evidently this gold came from a decomposed quartz vein in that vicinity.

FROM CROMBERG.—John M. Jackson was down from Cromberg Tuesday, on business. During the past several months, Mr. Jackson has been operating the Tefft mine. He has five men employed, and up to date has taken out several thousand dollars. The water season has been quite favorable and it will probably enable the lessee to ground-sluice most of the season. Mr. Jackson is a practical miner, having been engaged in that business since 1855.

THE ALTONA MINE.—Judge Emmons, of Greenville, has resumed work on the Altona mine operated by him last year. He is cleaning out and repairing the tunnel and will begin the extraction of ore. The ledge varies in width from three to sixteen feet, and the width increases with depth. This mine has a good reputation and last year it paid handsomely, and the prospects are that it will do the same in the future. It is located in the Cherokee mining district, northwest of the Green Mountain property. Last year the ore from it was hauled to the Acadia mill and crushed. Judge Emmons will soon have a patent to this valuable property.

FROM GIBSONVILLE.—F. M. Spencer arrived from Gibsonville Tuesday. He reports that section lively, and an increasing interest in the mines. The hotels are all full, it being difficult to secure a bed. Over 90 men are now working at Thistle Shaft. At the Union drift mine 25 hands are employed, and a large crew is at the Nevada. The Excelsior is understood to be yielding good pay. The tunnel at the Clayhank is being driven ahead.

OPENING MINES.—While in Prattville last week we met ex-Sheriff Rachford, of Modoc county. He was returning to the Eureka drift mine, owned by Rachford, Johnson & Emmerson. It is situated on Grizzly creek, seven miles south of Humbug valley. The company is running a tunnel to tap the mammoth channel, which can be traced to Cherokee, Butte county. Mr. Rachford is confident that a big mine exists there. Near by, on Soda creek, a small tributary to Mosquito creek, Mr. Rachford is prospecting good gravel and is getting some heavy gold. Some other Modoc parties are prospecting the Excelsior and Modoc, two claims situated on the channel above referred to. This country is liable to become an important mining camp of Plumas.

Shasta.

STRIKE.—Redding *Free Press*, June 24: A wonderful strike is reported on the south fork of Squaw creek, in which Jim Campbell and a man named Forbes are interested. Rumors of a big ledge containing free gold are rife.

A NEW MINING CAMP.—Redding *Free Press*, June 24: Mention was made two weeks ago of a sale of a mine an Pit river to a gentleman of Sacramento by Ezra Thomas for $4000. At the time of the sale we sought the particulars from A. D. Bowley, the purchaser, but that gentleman was somewhat chary of information, on the ground that he had not yet visited the prospect personally or consummated the deal. Wednesday afternoon we met Mr. Bowley, who had just returned from the pros-

pect, and he gave us the following information, which will ere long provoke some excitement and perhaps create a new mining camp in this county: The prospect is about five miles distant from the banks of Pit river, and about 20 miles in a straight line from Copper City, in a locality seldom visited by prospectors, and we should judge it to be on the same range as is Copper City and the old Afterthought mine at Furnaceville. Mr. Bowley says that the ledge is 50 feet wide and can be traced for two miles. He had to go on horseback, following a blind trail through almost impenetrable brush and over high mountains and across deep ravines. Across the ledge he blasted out specimens of quartz liberally sprinkled with free gold and sulphurets. The ore has a strong copper stain, and much of it is what is called "peacock" rock. Streaks of gold run through each specimen shown us, and Mr. Bowley says that anywhere pieces of rock bearing gold can be broken off the ledge. Since purchasing this prospect, Mr. Bowley, who is a real-estate dealer of Sacramento, has organized a company, and articles of incorporation will be filed in a few days. He says that there is no stock for sale, but that a company has been organized for working purposes only. If, as Mr. Bowley says, the ledge is extensive, there will be many other locations, and a second Copper City will be developed. In fact, it looks as if it were a similar deposit to that discovered at Copper City years ago; the ore probably lies in chimneys and bunches, and while some of it is base, other bunches will prove rich in free gold. Mr. Bowley will build a wagon road right away, and also a ferry across Pit river, and reduce the distance as much as possible. He leaves one man in charge, and before doing any thing further will pack into camp a load of provisions. Since the above was in type, we learn the additional facts from Mr. Bowley that the immediate ascent to the ledge is 1000 feet, almost perpendicular. The ledge itself is almost a perpendicular wall 24 feet high, and looks as if it had been laid bare by a slide. Mr. Bowley has located a water right and mill site, besides several claims, and in addition some seven or eight locations have been made by other parties. The mine was purchased of Thomas on the expert testimony of Captain Atkins, and the price paid was $10,000.

CYANIDE.—*Democrat*, June 28: Yesterday we noticed some large iron tanks being hauled out to the Hart mine. They are to be used in experimenting with the MacArthur-Forrest cyanide process. J. H. Stowell, the hardy old miner who owns valuable mines between Windy Camp and Iron Mountain, was in town Monday preparing to patent his group of five claims. During the past week there has been quite an exodus of prospectors to the new mining camp on Pootem creek, opposite the big bend on Pit river. According to the latest reports, some 40 odd claims have been located. Jewett Scranton is taking shipping ore from the Summit mine, in Sunny Hill district, that averages $700 a ton and over. All the high-grade ore from this mine is shipped to the Selby Smelting Works. This ore comes from a new chute lately discovered in the mine. Jim Sallee was in town last Saturday, having just returned from his mines on Salmon river. Jim says he is interested in a couple of good properties there, one of which pays a dividend of about $1000 a month, and the other is a new purchase which he is developing, and it is looking fine. He says the Salmon river country is a good country for the prospector. From Mr. C. N. Kingsbury of Igo, who was in town Monday, we learned that Mr. Edward Ballou is making a complete success with his experimental lixiviating and chlorinating plant in South Fork mining district. He works the gold ore of the camp up to 97 per cent and the silver ore up to 93 per cent. His mode is concentrating, lixiviating and chlorinating. He has gone through the experience of experimenting with refractory ores in that district and has achieved complete success. South Fork will boom yet.

Sierra.

THISTLE SHAFT.—*Mt. Messenger*, June 23: Seventy men are working at the Thistle shaft, Gibsonville, and, under the able management of C. B. Wingate, the mine is being worked with profitable results. The Pioneer Mining Co., at Grass Flat, intend to put up a new hoarding-house, and Superintendent Deisen expects very soon an electric plant from San Francisco, ordered by him on his recent business trip to the lower country.

Siskiyou.

RICH ROCK.—Redding *Free Press*, June 24: It is reported here that Jack Finley, superintendent for Captain C. J. Clark, who is running a mine on Salmon river, in Siskiyou county, has struck it exceedingly rich. He has no trouble in pounding out $500 per day in a hand mortar.

BONDED.—Yreka *Journal*, June 28: Cartright & Philips, of North Fork of Humbug, have bonded their mine to San Francisco parties for 30 days, and if everything is as satisfactory as prospects would indicate, they will make a sale for a good figure. San Francisco parties are investigating the Hegler mine, with a view of bonding. Much interest is now manifest in the mines of Humbug. Active work was begun on the Greenhorn Blue Gravel last Thursday. The new pump is performing its work in a highly satisfactory manner. They made considerable change and improvement in the hoisting works, so that they can progress without any interference. A full complement of men are at work day and night, and a large amount of gravel is being taken out. The supply of water for washing the dirt is falling off, and in order to meet this demand they are preparing to build a large tank to store up the water from the shaft, which will probably supply the deficiency. It is hoped that the Blue Gravel may have no further delays and that the work will continue prosperously. Mr. George Bowers, superintendent of the American Bar Co., at work in the Klamath river, called at the *Journal* office Monday, and showed us some fine, large specimens just taken out of the claim. He says that they are now at work with the most favorable prospects. The large water-wheel furnishes abundant power for operating the pumps, derricks, etc. The wheel is 18 feet in diameter and 54 feet long, and supplies several hundred horse power. They use two large centrifugal pumps. One takes water from the river and forces it through a pipe and sluices down the dirt in the claim, while the other carries the gravel and dirt into the sluice-boxes. The large boulders and rocks are removed with a derrick. The whole operation is carried on by water power, with the least amount of physical exertion of the men. They have about 30 men at work drifting and extending operations.

Trinity.

THE BIG DITCH.—Redding *Free Press*, June 24: Ed Jose, one of the owners of the Redding and Weaverville stage, informs us that the work will not commence on the big ditch intended to carry water to the Oregon Mountain gravel deposit until the latter part of next month. Three surveys are to be made first, one of which only has been accomplished.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia *Chronicle*, June 24: 1500 level—From the end of the southwest drift, 75 feet above the sill floor of this level, a winze has been started and sunk 15 feet in quartz formation. There is a narrow streak of ore in the winze averaging $22 per ton. 1650 level—Have continued making neccessary repairs to the drifts on the sill floor of this level and to extract some ore in working north from the crosscut run west from the northwest drift. The crosscut run east from the drift run south from the end of crosscut run east from a point 60 feet up in the upraise which was started from the drift run west from these north workings, 27 feet above the sill floor of this level, has been advanced 9 teet; total length 100 feet, continuing in porphyry and quartz showing some value. Have stopped work in this last crosscut and resumed work in the upraise from the point where the work was started. The upraise has been carried up 8 feet; total height, 68 feet. Have continued to extract some ore of average quality in working on the north and south sides of the drift run east (at a point 20 feet down) from the winze which was sunk from the crosscut run west from the main northwest drift. From the drift running south from this winze, at a point 52 feet down and 30 feet south, are extracting some ore of average quality. Have extracted during the week from all parts of the mine 278 cars of ore, about 272 tons. Have shipped to the Morgan mill 643 769-2000 tons, the average assay value of which (per car samples) was $29 86 per ton. The average assay value (per battery samples) of all the ore worked at that mill during the week (495 tons) was $28.19 per ton.

OPHIR—1565 level—The crosscut running east from the winze station on the sill floor of this level has been extended during the week 31 feet; total length 52 feet; continuing in a formation of porphyry, clay and quartz, which carries a low assay value. Have continued the work of making the necessary repairs in the shaft, being joint work with the Mexican company.

MEXICAN—On the 1565 level—The east crosscut from the north drift, at a point 409 feet in, has been extended 28 feet in a porphyry formation, showing clay separations. Have continued the work of making the necessary repairs in the shaft, being joint work with the Ophir company.

UTAH—340 level—The north drift from west crosscut No. 3, at a point 100 feet in from its mouth, has been extended 14 feet; total length 35 feet; face in quartzite, clay and porphyry formation of very low assay value.

SIERRA NEVADA—The intermediate tunnel on Cedar Hill has been advanced during the week 17 feet, making the total length 419 feet; the face is in porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 19 feet, making the total distance west of the joint shaft 3286 feet; the face is in hard porphyry.

UNION SHAFT—The joint Sierra Nevada and Union west drift, 900 level has been advanced the past week 20 feet, making the total distance west of the shaft 3286 feet; the face is in hard porphyry.

ANDES — On 420 level. south drift from east crosscut No. 1 north, has been advanced 14 feet; total length 41 feet; formation in clay and quartz.

GREAT WESTERN.—The west crosscut from end of south lateral drift has been advanced the past week 10 feet; total distance, 47 feet. The face is in solid quartz of low grade, which is being saved. Indications are that the west wall of the last ledge will be tapped within a few feet farther. The crosscut will be continued west until the west or white ledge is tapped.

GOULD & CURRY—200 level—West crosscut No. 5, started in northwest drift, 432 feet from main west drift, has been advanced 9 feet, passing through hard porphyry; total length 520 feet. Sutro tunnel level—The joint east crosscut with Best & Belcher Co. has been advanced 18 feet during the week; total length 44 feet; face in soft porphyry and vein matter; also did some repairing to the main north drift during the past week.

BEST & BELCHER—200 level—Have resumed work in northwest drift, 230 feet from our south line; advanced same 15 feet; total length, 245 feet, passing through porphyry, clay and quartz. 900 level—The southwest drift started from west crosscut No. 3, has been advanced 18 feet; total length 160 feet; face in soft porphyry. Sutro tunnel level—The joint east crosscut with Gould & Curry Co. has been advanced 18 feet during the past week; total length, 44 feet; face of drift in soft porphyry and vein matter; also did some repairing to the main north drift during the past week.

HALE & NORCROSS.—On 900 level have advanced the south drift 24 feet; total length 24 feet; face in porphyry. 1100 level—Have finished retimbering the main station on this level. Started a new south drift and advanced the same 10 feet; face in porphyry and streaks of quartz. 1800 level—We are stripping the main south drift on this level. Main shaft—We continue retimbering above the 1200 level, and are repairing main incline where necessary.

POTOSI—The south drift, 35 feet west of the main shaft on the 850 level, is out 89 feet; face is in porphyry and seams of clay. In the south drift, 25 feet south of the east crosscut, 930 level, have started an upraise, which is now up 10 feet; the top shows three feet of quartz, some of which gives fair assays. The north drift, 200 feet east of the Potosi winze, 930 level, is out 151 feet; face shows from 1 to 2 feet of low-grade quartz. The raise from the north drift, 100 feet north of east crosscut, 930 level, is up 60 feet on the slope; the top shows five feet of quartz containing some porphyry. The stope 50 feet below the 930 level is yielding fair-grade ore. Extracted and sent to the Nevada mill the past week 603 tons and 1500 pounds of ore from the 550, 1000 and 1150 levels. Milled during the week 600 tons. On hand at mill 166 tons and 1750 pounds. Average battery assays, $22.28; average car-sample assays, $24 75; shipped to the U. S. Mint, Carson, 431 pounds crude bullion.

CHOLLAR—Are repairing the main shaft at a point 50 feet below the 850 level. The north drift from the east crosscut near the south line, 930 level, is out 82 feet; face is in porphyry and vein material.

WARD SHAFT.—Have completed repairs to shaft and are now removing all tools and materials from the 1800 level.

ALPHA.—Repairs to the Ward shaft are completed, and are now removing all tools and materials from the 1800 level.

EXCHEQUER.— Repairs to the Ward shaft are completed, and are now removing all tools and material from the 1800 level.

KENTUCK.—On the 1100 level we have extended the main south drift 10 feet; total, 75 feet; the face continues in low-grade ore. The upraise near the north line is up 46 feet; top in ore of milling value. The joint east crosscut on the Jacket north line is in 88 feet; face in quartz and porphyry. Have started a south drift from the joint crosscut in the ore found in said crosscut at a point 51 feet from the main south drift.

OCCIDENTAL—From the stopes and upraise on 650 level we have extracted about 40 tons of fair-grade ore. No. 3 crosscut from Zadig drift, Sutro tunnel level, has been extended 10 feet; face in quartz and porphyry.

NEW YORK. —The upraise from No. 3 west crosscut, 800 level, is up a distance of 46 feet on the slope; formation quartz.

Ruby Hill District.

GRIZZLEY ORE.—Salt Lake *Journal*, June 20: A carload of ore from the Grizzley mine, in Ruby Hill district, White Pine county, Nevada, is expected in the city by July 1st. This ore is rich in ruby and horn silver and bromides, and, according to McVicker, assays go 1049.96 ounces of silver to the ton. Mr. Ike Jennings, president and manager of the Grizzley Mining Company, informs the *Journal* that they have a four-foot body of this class of ore. The Grizzley is a great mine and will make Ruby Hill district more famous than ever, besides which it will make bonanza kings of its owners.

Ferguson District.

GOLD ORE.—Salt Lake *Journal*, June 24: There are two cars of rich gold ore in to-day from the Monitor mine, one of the properties of the April Fool Company, in Ferguson district, Nev. The Company expects to ship at least 100 tons during the present month.

Central District.

NEW GOLD DISCOVERY.—Carson *Appeal*, June 18: L. F. Dunn returned last night from a prospecting trip. After making several rich placer locations in the Humboldt range, he went over into Central district. There he discovered a gold ledge four feet in width, and as the miners say, it was "lousy with gold." It was found about 500 feet north of the northern boundary of the Blackbird and Fellows' claims, and lies between a slate and sienite formation. He says these other claims are spurs of his mine—that he has the mine of the district. Dunn and M. S. Bonnifield are the locators. In early days it was thought that our mines of value were silver mines and little attention was paid to gold. But from the valuable mines now being worked and new discoveries made in Central, Rebel Creek and Kennedy districts it seems we have most valuable gold veins. Besides hundreds of Chinamen and a great number of white men are taking out large quantities of gold from the many placer claims in this country. Dunn says the goldbugs cannot get the best of him as inside of 12 months he will have more gold than any of them.

White Horse District.

ONLY PROSPECTS SO FAR.—Wadsworth *Dispatch*, June 23: White Horse district and its mines have been partially prospected for 25 years. They are but "prospects" to-day; but, while we believe they are good ones, we bear in mind the setbacks and calamities which have befallen other mining camps which had prospects just as bright, and brighter, too, than the White Horse. It has taken Ferguson district a long time to recover from the boom caused by undue excitement at the beginning, and only to-day is that district recovering. The gag was put upon it by so-called mining experts. We have no desire to see White Horse paralyzed in that way, or a horde of idle miners brought into a mining camp where there is no work for them to do. As it is, there are simply good prospects. There are no developments to date to show the presence of large ore bodies, but the best mining talent on the Comstock theorize that large ore bodies will be found. It has been and is our belief that to say $10,000 ore is being found in White Horse, because a half-inch vein of that value was found, would mislead those whom we would seek to interest. Rich stringers bearing coarse gold are found along the whole lode. The only mine upon which much work has been done, and which shows a well-defined ledge, is the Jim Blaine, owned by Ed Gregory. He has a shaft 25 feet in depth and an 18-inch ledge with ore averaging $300 to the ton. This is certainly a fine prospect, but the extent of the ledge is not known. Wm. Johnson has a hole in the ground and thinks he has a ledge with rich ore, but extent not known. A trial lot of 400 pounds went $20 to the ton when milled at Reno, picked at haphazard. The Sunset Company has a shaft $25 feet deep. Quartz bearing coarse gold was found on the surface. Crosscutting will commence when, in the opinion of Superintendent Crosby, a sufficient depth has been reached. R. H. Cowles has struck a ledge by drifting, and says he is in good quartz. Dr. E. A. Jackman has a No. 1 prospect. There are rich croppings on other claims, but no developments have yet been made. We know, as does every other common-sense mortal, that if the claims in White Horse are good, the fact will be asserted soon. They will speak for themselves. In the meantime, we are fearful of intense excitement, and feel that no great good can come of it. The district is in good, careful hands. Ed Gregory, the primary prospector and most interested party, is a poor man with a great deal of good common sense, and he has handled the matter most successfully up to the present date, and has taken every step slowly and carefully. He is deserving of all he gets, and we trust the good angel who has guided his actions to this point will stay with him to the end. Part of the needed capital is interested, and we will soon know what there is in White Horse. There is room for capital, but the need for labor is at present limited. With excitement stayed we feel assured of the ultimate success of the mines, but excitement in this case is an enemy to be dreaded. Such excitement is the product of the tale that there is $10,000 ore in White Horse. If a prospector talking to a capitalist tells the latter he has $10,000 free-milling gold ore but feels too poor to work it, the moneyed man thinks the prospector is trying to "pull his leg," and negotiations cease. Simple, literal truth, and not extravagant language, is wanted. We have put money in White Horse, have faith in it, and believe it will get along without a boom.

BRITISH COLUMBIA.

CLAIMS REGISTERED.—*Golden Era*, June 24: Up to the present time 933 claims have been registered in this district. Notwithstanding this enormous number fresh strikes are constantly being made. Only two days ago two strangers found and located a most promising lead. The Wakefield claim, on Four-Mile creek, has been bonded for $15,000. The London Mercantile Association, which purchased through Mr. Chadbourn the group of claims known as the Read and Robertson, has completed a trail to the claims and started in to develop them. The Minnesota capitalists represented by W. D. Middaugh and Gen. Scott, have commenced work on their claims on Carpenter creek, and are breaking up the huge boulder of solid galena found on one of them.

DAKOTA.

THE DEADWOOD-TERRA.—Deadwood *Pioneer*, June 24: By the blowing out of a cylinder head and cracking of a cylinder at the Deadwood-Terra mill yesterday, about noon, the plant was crippled until repairs can be made, which will require some weeks. Engineer Woodcock turned off the steam as soon as possible, but the engine was rendered a complete wreck, so far as any present use of it is concerned. Just what caused the accident is hard to tell, but it is supposed that either a crosshead pin or a follower-bolt came out. It is thought that the mill will necessarily be shut down for about six weeks, as a new cylinder will be required from the Chicago works. This will throw about 300 men temporarily out of employment.

THE KEYSTONE.—There is an apparently well-authenticated rumor to the effect that the Keystone mill is to be increased from a 20 to a 60 stamp mill at once. It had been expected that at the annual meeting, to be held in July, such an increase would be decided on, but it is now stated that President Stone, who is a large stockholder, and who recently visited the plant, was so pleased with everything that he assumed the responsibility of ordering the mill enlarged. John Christensen will go over to the mill to-day to arrange for beginning the work. All this would seem to imply that, notwithstanding the negative reports, the Keystone is a booming success, and the stockholders are well satisfied.

TO BUILD A MILL.—Salt Lake *Mining Journal*, June 27: The Mercur Mining Company is considering the question of building a new mill at the mine. If the mill is built, the water to run it will be piped from the spring at the old mill, and Hal. D. Brown goes out next Monday to survey the pipe-line and mill-site. The new mill will have a capacity of from 200 to 400 tons of ore daily.

IDAHO.

EXTENSIVE PLACER MINING. — Salmon City *Recorder*, June 23: On last Thursday we visited the Lemhi Placer Co.'s diggings on Kirtley creek. The work, under the personal supervision of Mr. G. E. Yates, the manager, is being prosecuted in a thorough and systematic manner and with all modern appliances. Two of the giants were being used; the larger one, run with water from the Carmen creek ditch, was throwing a stream of 1150 miners' inches from a 6½-inch nozzle with a 375-foot pressure, and was tearing away the bank at a terrific rate. The smaller giant was run from the Kirtley creek ditch and was used merely to increase the volume of water. This, with the ground sluice, makes about 1800 inches of water altogether now in use. Some 65 men are on the pay-roll, the greater number of whom are employed in extending one branch of the flume some 75 or 80 feet up on the south side of the cut. When this is completed the third giant will be set to work, as the water supply will then be ample for work on a larger scale. The piping is continued day and night, the works being lighted by electricity with four large arc lights of 2000-candle power each. The ground prospects beyond the expectations of the management, and without doubt the company will make a nice clean-up as the result of the season's work.

MONTANA.

PLACER MINES.—Anaconda *Review*, June 22: The Rock Creek country is developing several rich sapphire diggings, stones from which are said to be more valuable than those found in the bars in Lewis and Clarke county. Encouraging reports are received from the Georgetown district of not only new discoveries but that properties idle for years will be and are being worked. New people are coming into the district every day and several important sales are on the tapis. Several reports have been received here from Princeton that the owners of the third extension to the Royal vein had struck ore in the main tunnel of the Mountain King, and that they had the same character of rock originally found in the Royal mine, from which over three fortunes have been taken. The Big Hole country is receiving an unusual amount of attention now on account of the report that new diggings had been opened near French Gulch, which ten years ago yielded $10 to $20 to the man. We can conscientiously say that this is going to be a prosperous year for mining operations in Montana, and Anaconda seems to be the center or tributary to the new fields of operation. There have been several important strikes in mining properties about Anaconda the past week. The first one that came to our notice was the one over in Lost Creek in the old Hidden Treasure property. They have found a small vein of exceedingly rich gold-bearing rock that needs no assaying

to say how valuable it is. It will only take a ton or two to satisfy our worldly desires. An old-time miner informed the *Review* man the other day that there were more gold prospects in the Georgetown district that would pay capitalists to take hold of than in any other section of Mootana. He said that it would take a little money to develop them, but that there was enough in sight to pay for all development work.

UTAH.

CAMP CROSSCUTS.—Park *Record*, June 24: Ore-hauling continues quite active in spite of the low price of silver and lead. Dave Condon has resumed operations on the Creole, the surface water having ceased to give any trouble. He is drifting on the vein. On the 21st the Ontario mill shipped 26 bars of bullion containing 16,325.29 fine ounces of silver. This is the first shipment since the mill was repaired. The grade for the new leaching plant is rapidly nearing completion, and the work of laying the foundations will soon be commenced. Bartley McDonough and Hugh Kilkenny have received a United States patent for the Golden Head and Salt Hill Consolidated mining claim, lot No. 151, located in Snake Creek mining district. The piping for the Alliance tunnel has all been taken to the mine, and is now being placed in position. It is thought the tuonel will be turned over to the Crescent Company some time next month. The Kentucky leasers are cleaning out the old shaft and re-timbering it. As soon as the bottom is reached, the vein that was cut therein will be followed. Some very fine ore was found io the vein, but there was only a little of it. The following lots of ore were received at and forwarded from the Mackintosh sampler during the present week: Anchor, 681,600 pounds; Silver King, 6co,500; Daly, 301,610; Daly West, 301,570, making a total of 1,885,280 pounds.

CRESCENT.—Salt Lake *Journal*, June 27: Thos. Carter, a large Crescent stockholder, returned Saturday from a visit to the mine at Park City. He informs the *Journal* that the mine is in an excellent shape, and that the average daily output is 130 tons of first and second class ore. A large amount of ore is being stored at the concentrator so that a winter's run can be made if necessary. In another month the winter's coal for the mine will be taken up, and preparations will he made so that mine and mill can be kept in constant operation if the metal market will justify. C. McCarty, one of the operators of the Lone Pine, in American Fork canyon, was in the city Saturday. Some good ore has been recently encountered in the Loue Pine, and it promises to he a heavy producer. Mr. McCarty says that, although that district has been laboring under a bad case of black eye for some time, still it is bound to come to the front again, hecause they have the ore, rich and unlimited. Frank T. Hiatt has leased the Iron Duke mine for one year at 10 per cent royalty to E. C. Small and F. X. Hoy. The Iron Duke is located near Silver City, Tintic, and is a property of much promise. Tom Lewis and associates, who have stuck so pluckily to the Cleveland, at Mammoth, are about to receive their reward. Last week a fine body of ore was encountered, assaying between $200 and $250 per ton.

Market Reports.

The Markets.

SAN FRANCISCO, June 29, 1893.

During the week past the price of silver has taken an unprecedented drop, the direct cause being the announcement that the Indian Government had passed an Act closing their mints to the free coinage of silver. It is declared to be the intention of the Indian Government to introduce and maintain a gold standard, but that gold in the meantime will not be made the sole legal tender. Inasmuch as India is one of the heaviest buyers of silver, its unexpected action has had the effect of producing a temporary paralysis of the silver market. Since Monday the price has rapidly declined, until to-day the New York quotation was 62 cents, a drop in four days of nearly 20 cents per ounce. In London, the falling off has been nearly as notable, the quotation being 37⅛ pence Saturday and 34 pence yesterday. We have at this writing received no advices of to-day's London quotation.

The direct result of the action of India has been to renew the discussion of the silver question; to shut down a large number of mines and smelters; to stop silver purchases; to renew the probability that Congress will be called early in September to deal with the money question; and to strengthen the hands of the miners in their efforts to resume hydraulic mining in California.

The stoppage of silver coinage on private account in India, acting under direction of the British Government it is admitted, will have momentous consequences. For instance, the effect on Indian wheat competition with American wheat and on this country's trade with the East Indies and with South America, is a subject that is involved in uncertainty, and not least of the consequences which are shrouded in doubt is the possible result of England's action on her own Eastern dependencies, and the reaction which will be felt everywhere on international trade. Conservative men are loth to commit themselves to positive opinions upon the different aspects of the situation.

The confusion into which the silver market has been thrown was indicated when dealing in silver hullion certificates began Tuesday at the New York Stock Exchange. These certificates are issued by the Mercantile Safe Deposit Company upon bullion deposited with it. The company now has only 210,742 ounces. There has been no extensive speculation in these certificates since the big "bull" movement which attended the progress of the legislation that took form in the so-called Sherman law of 1890. Tuesday the market for certificates opened in a complete state of demoralization.

The first bids were 74 cents an ounce, but no offers were made below 78 cents, the Monday-night price. As no sales were possible at higher figures, holders began to reduce their offers, but would-be buyers more rapidly lowered their bids. By the close the difference between bids and offers, which had started at four cents an ounce, had widened to 6 cents, offers being made at 76 cents and the best bid being 70 cents. There was not a single transaction in consequence of the wide disparity between the views of buyers and holders.

The commercial market for bar silver was practically at a standstill, but 73 cents more was the nominal price. In London the price of bar silver fell to 35d per ounce, following the decline of 1⅛d on Monday.

Opinions differ as to the immediate cause of the silver market depreciating. The effect of England's action is admitted, but some of the dealers contend that the full effect of the shock has been felt for the present.

Secretary Carlisle, in response to a request to express his views on the financial situation as affected by the action of India on silver, politely declined, saying that under the circumstances he had nothing to say for publication and did not care to indulge in speculation as to the future.

Two hours were consumed by the Cabinet Tuesday discussing the new phase of the silver question, while other matters were demanding attention.

Although the discussion, it is said, took a wide range, it was necessarily brought back to the ooe important and unmanageble point that the executive had no power in the premises, Congress alone being able to deal with measures of relief. It was plain to the Cabinet that the monthly purchase of silver must be continued or Congress must be convened in soecial session immediately. As the President has decided to call Congress together in the early part of September to deal with the financial situation, and has manifested no intention of changing his purpose, the project of an earlier session of Congress, it is understood, was dropped.

A Monetary Revolution.

A. J. Warner, of Ohio, president of the Bimetallic League, says: "The stoppage of the coinage of silver in India has inaugurated a new mooetary revolution. It is a movement deep-seated, and it will be far-reaching in its consequences. The closing of the mints of Bombay and Calcutta is part of a gigantic coospiracy to seize upon the present opportunity to finally and forever adopt the single gold standard and to extend it all over the world. The immediate consequence will be that silver will fall and gold will increase in value faster than ever before. Prices will fall everywwhere as gold rises, and every advantage will inure to creditors and creditor nations. England has set out to subdue the world, not with arms but with gold.

"What is there left to do but for the western continent, under the lead of the United States, to unite and act independently and establish a financial system founded upon equity and calculated to secure stability in value, and one which will keep an even halance between debtor and creditor—not one calculated to rob with impunity the debtor for the benefit of the creditor."

A national convention of the American Bimetallic League has already been decided upon for the latter part of August at St. Louis or Chicago.

Gold from England.

Owing to the low rates of sterling exchange the first importation of gold for some time has left Southampton for New York. The amount is $500,000. It is reported that $1,000 000 more is ordered.

Mining Share Market.

The decline in silver started stocks downward as might have been expected, though the market was rather active on Monday. Since then, however, it has been dull and weak. Favorable news from the mines cuts little figure. The large proportion of gold in Comstock ores compared with the general run of silver mines is a good thing, but silver mining is "in the dumps" just now and will be until Congress takes some definite steps.

The San Francisco and the Pacific Boards adjourn from Friday noon over to Wednesday morning.

The West Consolidated and Virginia and California Mining Company, by a representation of 92,008 shares, has elected the following directors and officers: M. W. Fox, president; George P. Thurston, vice-president, and W. T. Baggett, A. D. Carvill and R. U. Collins, directors. P. H. Andross was re-elected secretary.

The North Belle Isle Mining Company has re-elected the old management with E. Scott as president, J. W. Pew secretary and R. C. Catlin superintendent. The company has a debt of $7916.22.

The Mayflower Gravel Mining Company has declared a special dividend, of 10 cents per share, payable June 30th.

The North Star Mining Company of Grass Valley has declared a dividend of 50 cents per share, aggregating $50,ono. This mine has paid $420,000 in dividends since the re-opening of the mine a few years ago.

499,934.—ROPE LEADER FOR DRUMS—N. H. Pine, Eureka, Cal.

499,853.—REVERSIBLE PLOW—A. Pirch, Los Angeles, Cal.

499 938.—ANIMAL SHEARS—A. D. Reynolds, S. F.

499 939. TELEMETER—J. F. Santillana, S. F.

499,949.—CAN HEADER—M. A Wheaton, S F.

499,815.—FILLER—A Williams, Seattle Wash.

500,691.—BED-CHAIR—J. C. Wood, Los Angeles, Cal.

499,902.—BED-COUCH—J C. Wood, Los Angeles, Cal.

The following brief list by telegraph, for June 27, will appear more complete on receipt of mail advices:

Oregon—Clarence A. Burhank, Portland, houqnet holder.

Montana — Earl P. Wetmore, Helena, electric heater.

Nevada—Albert W. Lacey, Gold Hill, cable protector.

Washington—John T. Bibb, Tacoma, current motor; Joseph P. Brickley, Port Angeles, platform for wood-choppers; Albert Johnson and F. Syornd, Shelton, rowing narrow; John T. Lucas, Centerville, gang or cultivator plow.

California—Daniel Behmer, Santa Rosa, pruning implement; Friend J. Bringham, Oroville, billet-loop; Andrew J. Culbertson, San Andreas, train-table; William A. Dohle, San Francisco, apparatus for reducing bituminous substances; Hugo Gallinowsky, San Francisco, artificial stone; John H. Griswold, Oakland, line-holder and guide; Joseph J. Hall, Willows, grate; Alfonzo Haskins, San Francisco, asphalt distegrating holler; Cornella F. Hathaway, San Francisco, shoe-lace fastener; Arthur T. Snell, West Satlcoy, and W. R. H. Weldon, Ventura, harness; William S. O'Srien, San Francisco, design.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CARD CATALOGUE AND INDEX.—Alexander J. Rndolph, S. F. No. 499,441. Dated June 13, 1893. This improvement in indexes and files consists of a series of cards with a means for holding index slips upon them, a box within which the cards are sustained, a pecnliar device for snpporting the cards in position to be readily examined, and movable indicators whereby the proper position of each card of a series is at once determined and any displacement of any card is detected.

BOOK INDEX AND FILE.—A. J. Rndolph, S. F. No. 499,442. Dated June 13, 1893. The invention relates to certain improvements for compiling and arranging catalogne indexes or files. It consists of a series of slip-holders to contain index or other slips, said holders being hinged together at one edge and capable of indefinite multiplication or snbdivision, the hinges being easily disengaged for that purpose. The object of the invention is to provide what the inventor calls an elastic book index, in which each entry is movable so that any number of entries may be inserted before or after it, and every entry, whether new or old, is always in its own proper place; and furtber, in the ability to insert any number of slip-holders at any point with relation to those already in the book, whereby the hook may be indefinitely enlarged, or it may he snbdivided at any time to form new volumes if it becomes too bulky.

SEPARATOR. — John M. Finch, Marysville. No. 499,915. Dated June 20, 1893. The invention relates to that class of machines for separating materials composed of particles of different specific gravities, in which a current of air is directed upon the falling material, said machines being known as air or gravity separators or purifiers, and particnlarly designed for separating or purifying middlings in flour-mills. The invention consists in a rotating cage to which the material is fed, the periphery of said cage heing so constrncted as to retain and constantly raise and drop the material, and of an open character to freely admit the passage of a current of air through it, and snitable means for creating and directing a current of air through the open periphery of said cage and against the constantly falling material, whereby the latter is repeatedly snbjected to said current.

ANVERTISING CLOCK.—Lewis Peterson, San Rafael, assignor to Western Clock Advertising Co., of San Francisco. No. 499,931. Dated June 20, 1893. The invention relates to that class of advertising devices in which a series of advertising placards is periodically driven to exhibit snccessive placards, by means of a clock operating through snitable intermediate mechanisms. The object of the invention is to provide a simple, effective and attractive device of this kind, and the patent covers certain novel combinations and arrangements of parts. As each placard is dropped by the mechanism a gong is struck which attracts attention to the exhibition of the placard. The time during which the placard is exhibited can be properly determined by the movement given to a certain cam wheel.

EB WILLIAMS,

ATTORNEY - AT - LAW,

NOGALES, ARIZONA.

Will give attention to the collection of claims and settlement of business in any part of Mexico.

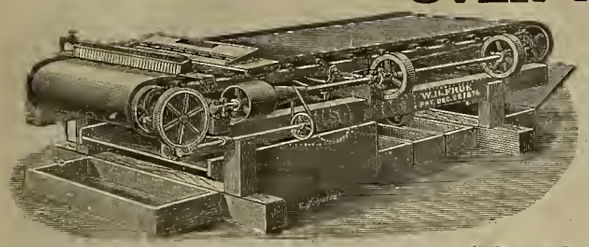
FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.

Queer Ideas About Miners.

A number of students from the Stanford University, under the assistant professor of mineralogy, have been making a geological tour in Shasta county, collecting specimens of ores and minerals, fossils, etc. The account of their trip states that they left here in June "togged out in typical mining costume, laden with pistols, shotguns rifles, knives and geological hammers." It is probable, now that they have retnrned, that they have found out that there is no typical mining costume and that miners or prospectors carry none of these weapons these days, and never have geological hammers. It is strange how the public cling to the Bret Harte style of miner, who has long since passed from the realm of reality into that of romance. Miners or prospectors at work dress much like other working people. They all wear old clothes and few, if any, carry weapons. The pistols, rifles and knives are found no more frequently upon the miners than upon farm hands in this State. A man going around a quiet camp or region with weapons strapped to him would he laughed at as a tenderfoot. Of course, on a long prospecting trip a shotgun or rifle might he carried so as to get game, or a pistol might be worn. But, as a general thing, these things have disappeared from the miner's life, simply because there is no need for them whatever in California.

Most of the miners of this State are now men who work for wages by the day or month. As a general thing they do not go around swaggering with revolvers looking for a tougher man to have a row with. This kind of bar-room miner is rather out of style in California in these times and does not work in the mines to any extent. Mining in this State has got down to a business basis just like any other industry, and the men connected with it have to behave themselves or they get no work. Drinking men are not wanted, steady men can get steady work, but the swaggerer with a revolver strapped to him is not in demand as a miner.

Aside from the armory which the Stanford students considered it necessary to take, their geological hammers would be a dead give away as to their mining experience from a practical point of view. Scientific men may carry them, but miners or prospectors as a general thing care little and know less about geology or geological hammers. As a matter of fact geology being to them as a class, a sealed hook, they do not take much stock in the men who understand that science, without having much experience in the practical points of mining.

They argue that geologists do not discover mines, and people do not employ them to superintend or work one. They may find out some things the miners do not know, hut the miners also find out many things they do not know. From the money-making view the miner has rather the hest of it. Therefore he cares little for the geological hammer when he prospects, finding a much more useful implement in a pole-pick, which has a business end as well as a geological end, so to speak. The business end will get a rock out and the other end break it up.

A kid-glove miner with a geological hammer, a revolver and a "typical mining costume" is more apt to excite ridicule than admiration among the California mountains. A trip or two will, however, tone a man down as a usual thing, and he will then dress like an ordinary mortal and cease to make a guy of himself. Mining engineers of experience understand this perfectly.

Comment.

Notwithstanding the fact that thousands of mines all over the West must remain idle for some time to come, owing to the decrease in value of silver and lead, the law requires that annual expenditure shall be made on all of them, whether worked or not, unless Government patent has been granted. A correspondent, in a letter in another column, makes the suggestion that an effort be made to have this provision of the mining laws suspended for the present, in view of the situation. If men of prominence in the mining industry would make an effort in this direction they would be benefited themselves, and the smaller mine-owners would he grateful for their help. It is not only the mere actual outlay of the mine itself, but the cost of the assessment work is greatly added to in many cases hy the distance from the railroad. Under present conditions there is no earthly use doing anything on these mining claims, yet the work has to be done else the claim and all expenditure on it up to date is lost. It must be confessed it is very difficult to make Congress pay much attention to the mining laws, or force upon it a knowledge of any evils which may exist in them; yet, if united effort he made under the present circnmstances, there may be some hope of accomplishing this.

The prospects of the Midwinter Fair to be held in this city are much better than could have been anticipated a few weeks ago. The sum of $330,000 has already been subscribed, which, for a community in the midst of "hard times," is a pretty good showing. It is desired to have a total amount of $500,000 and it is expected that there will he no difficulty about raising this. A site has heen selected in Golden Gate Park for the buildings, which will be four in number. Of these the most elaborate and beautiful will be the manufacturers' and liberal arts building, for the reason that it will be a permanent one, and after the exposition is over will be presented to Golden Gate Park for a museum huilding. The other huildings will be the hall of agriculture and horticulture, the art palace, and machinery hall. The States of Washington and Colorado may also erect buildings, and Arizona, Oregon and Nevada will assist in making the Fair a success. The foreign exhibitors at the Chicago Exposition are expected to bring their displays here and will doubtless he followed by many domestic exhibitors. It is understood that the railroad companies will make a very cheap rate of fare, which, in fact, must he done, to induce any large amount of people to come from the East. The Executive Committee in charge of the project express themselves as well satisfied with the outlook and are hard at work perfecting the plans.

Several of the leading mining men of Montana issued a call for a convention of silver miners, to take place July 6th, at Helena, in which they say: "We invite your most serious consideration to a fact not creditable to the silver miners of Montana; i. e., that while the representatives of every interest of the United States are preparing for this great conflict, the producers of silver are inactive, irresolute and idle, waiting in dumb dismay for something to turn up, instead of proceeding themselves to play a part in determining results clearly within their reach. In view of the situation we take the liberty of asking all mine owners, proprietors of reduction works, and all others interested in the production of silver, to meet in convention at the Broadwater hotel, near the city of Helena, on the 6th day of July, where it is hoped a perfect organization will be perfected, so that silver producers will bear their own fair share of the burden of the battle that is now on. We feel that we have a right to demand your personal attendance, or that you be represented by a person with full authority to act for you and your company." The fact here stated has been previously commented on in other States, that is, that the silver mining companies have let others do the fighting for the white metal and have done little themselves. We have had a parallel case here in California, where many persons owning hydraulic mining properties have not put up a cent, or given any other kind of assistance toward the rehabilitation of the industry. The men who have taken the most active steps have no personal interest whatever in any hydraulic mines. In the silver fight the silver producers must now join and do something in a practical way. Montana is largely interested in this subject because eight or ten thousand men have in the last week been thrown ont of employment by the closing down of the silver mines.

President Cleveland has issued a proclamation to convene Congress in special session on August 7th, and then the great battle for and against silver will be fought. He says: "The present perilous condition is largely the result of a financial policy which the executive branch of the Government finds emhodied in unwise laws which must be executed until repealed by Congress." This is, of course, the Sherman law, which requires the purchase of 4,500,000 ounces of silver by the Government per month. It is over this that the contest will be. Already the "silver men" are marshalling their forces. The American Bi-metalic League has issued from national headquarters at Washington, a call for a national convention in Chicago on August 1st. All members of the league are urged to attend, and all who favor maintaining the money of the Constitution and who are opposed to the establishment of the single gold standard in the United States, without regard to party, are invited to attend and participate in the deliberations of the convention. All economic associations and all industrial organizations are requested to send delegates to the convention. A special invitation is extended to the members of Congress and the members of State Legislatures. The Governors of the States are requested to appoint as many delegates as they deem proper. The idea of the silver men is to meet at Chicago and adjonrn to Washington. Here the convention will assemble about the time that Congress convenes. The object is to impress Congress with the strength of their cause and to present such arguments as may aid it.

Mining men say it is now immaterial how low silver goes. Having gone below 80 cents, the effect is just the same as if it were 60 or 50, hecanse the mines have to close. Profitahle silver-mining nnder present conditions is impossible. Ore-buyers have ceased to buy, smelting works have closed down, the big mining companies have ceased operations and leasers have stopped work. This is not a local condition, but exists in all the silver-mining regions. While the smelters elsewhere are stopping work, the Selby Smelting and Lead Co., with main offices in this city, continue as usual and have plenty to do. Under their system the silver is sold as soon as in condition for market, and their silver account shows a profit. These works are rnnning as usual and intend receiving such ores, concentrates and hullion as may be shipped to them, and will make prompt settlement as hefore. Ore-shippers should remember this fact, while so many other smelting works are declining to receive ores and announcing their intention of suspending operations until the silver question is settled.

THE SOUTHWEST SILVER CONVENTION.—This convention, which was held at Silver City, N. M., adjourned on Wednesday to meet at Albuquerque during the Territorial Fair next fall. A number of able speeches were delivered, including those hy Governor Thornton and H. B. Fergusson of Albuquerqne. The resolutions which were adopted demand the repeal of the Sherman law and the enactment of a law providing for the free and unlimited coinage of gold and silver at the mints, at the ratio of 15.98 of silver to one of gold as the effective and only relief from the present deplorable financial condition.

Product of Silver in the United States.

The Government has more difficulty in estimating with accuracy the annual output of silver from the mines of the United States than it has with the gold product. The silver purchased by the Government consists very largely in the finished product of private works. These bars contain large quantities of foreign as well as domestic silver. The great bnlk of the silver product of our own mines, together with all the smelting ores and base bars imported into this country go to private works for reduction and refining. There are no facilities at the mints and assay offices of the United States for treating ores or very base bullion. Moreover, Government institutions do not offer the same advantages to producers of silver as do private establishments, for the reason that no allowance is made at Government institutions for the value of hase metals commonly associated in nature with silver, such as lead or copper, which are paid for at private establishments and constitute a very valuable component of such product.

The product of silver, moreover, passes through many hands before it reaches the mints or is exported in the shape of fine silver bars. In the first place, it is usually sampled by ore-dealers; from there it then finds its way to smelting works, where it is made into base bars, and from there to private refineries, where the hase metals are separated from the precious metals, and the precious metals in tnrn refined into bars of practically pure gold and silver. This is then ready for the mints It is thus seen that private establishments do all the preliminary work with the bullion, before the mints take it.

We were informed by the president of the Selby Lead Works that the silver offered by them to the U. S. Mint in this city on Wednesday, was declined. Dispatches from Washington, state that on that day 530,000 ounces of silver were offered to the treasury, but there were no purchasers. Acting Mint Director Preston did not purchase any silver, as he considered the offers made were too high. He did not, as he has done recently, make any counter offers. Small lots were offered at .7545 per ounce, but most of the prices ranged from .769 to .760. Inquiry at the Treasury Department as to whether the amount of silver offered the Government is as large now as formerly developed the fact that for the first six months of the cnrrent calendar year the offsrs aggregated 52,300,000 ounces, while for the same period last year they were only 45,350,000, showing an excess for the corresponding period this year of 6,950,000 ounces, which would indicate that the production of silver is not falling off in the United States. The amount of silver bullion imported for the first six months of the current calendar year, including that in ores, was $8,471,000 ounces, while there has been exported 11,968,000 ounces. Of the amount of silver offered the Government during this period 27,000,000 ounces were purchased.

It is important to note that importations of base silver bars, and especially of argentiferous lead ores from Mexico, South America and British Columbia, steadily increased in quantity last year notwithstanding the low price of silver and the import duty imposed npon the metallic lead contained in imported silver ores. It is almost impossible to separate the mass of silver coming in various forms and nncertain quantities from the product of our own mines. For these reasons the Director of the U. S. Mint finds it difficult to estimate with accnracy the output of silver from onr own mines as contradistinguished from the outpnt, in the shape of fine silver bars, from private works representing the product of foreign as well as domestic silver. In the PRESS of last week were given the figures showing the relative yield of silver of the different States of the Union. In 1892 there was a smaller aggregate silver product by 330,000 ounces than during the year 1891. However, the largest silver producers, Colorado and Montana, increased their product materially, the falling off occurring in Nevada, Idaho and Utah.

The product of silver from the mines of the United States, as estimated annually by the U. S. Mint Bureau, since 1873, may be recapitulated as follows:

PRODUCT OF SILVER FROM MINES IN THE UNITED STATES, 1873–1892.

Calendar Years.	Fine Ounces.	Commercial Value.	Coining Value.
1873	27,650,000	$35,750,000	$35,760,000
1874	28,849,000	36 869 000	37,300,000
1875	24,513 000	30,519 000	31,700,000
1876	30,069,000	34,690,000	38 800,000
1877	30,783,000	35 970,000	39,800,000
1878	34,960,000	40,270,000	45,200,000
1879	31,550,000	35,430,000	40,800,000
1880	30 320,000	34,720,000	39,200,000
1881	33 260,000	37,850,000	43 000,000
1882	36,200,000	41,120,000	45,800,000
1883	35,730,000	39,680,000	46,200,000
1884	37,800,000	42,070,000	48,800,000
1885	39,910,000	42,500,000	51,600,000
1886	39 440,000	39,230,000	51,000,000
1887	41,261,000	40,410,000	53,350,000
1888	45,780,000	43 020,000	59,195,000
1889	50 000,000	46,750,000	64 646 000
1890	54 900,000	57,225,000	70,465,000
1891	58,330,000	57,530,000	75,417,000
1892	58,000,000	50,750,000	74,989,900

THE Northwestern University, at Chicago, has established a chair on mineralogy and invited Prof. A. R. Crook to fill it.

The Gold Producing States.

The fntnre of the Black Hills as a commercial and mining conntry is assnred and the realization is close to dawning. This is pre-eminently a gold conntry, the yellow metal predominating over the whlte to snch a degree as to almost sxclnde the lattar. With silver qnoted in the seventies and gold approaching a preminm, the advantage of this condition is apparent. In Colorado and other silver-mining States the depression of silver has cansed over 50 per cent of the mines to close down, while in the Black Hills prospecting was never before prosecnted so persistently, while every dey adds to the list of prodncing mines. For this reeson the Bleck Hills has felt hnt lightly the financial stringency and will early rally from the depression. Then, as confidence begins to be restored, investors will turn to a field where gold-beering properties can he had, and the hulk of money designed for investment in mines will find its wey to the Black Hills, drawn hither by conditions thet exist nowhers elss in America. A few months will witness this chenge end a few yeers will emphasize it. For every prodncing mine now there will then be hnndreds, and for every reduction plant now there will then be ten. The cities of the Bleck Hills will increase in popnletion repidly end the entire section become the weelthiest, most popnlons end importent mining section in the world.—Deadwood Pioneer.

If the South Dakota people can thus strongly congratulate themselvea on their gold mines, what should we in California do with many more of such mines and an annual gold pruduct three or four times that of South Dakota. The *Pioneer* is a little mistaken in its statement that " such conditions exist nowbere else in America." It has possibly forgotten all about California es a gold prodncer, though this Ssate still leads the list by a long distance.

Tbere are only four States of the Union which produce over two millions in gold per annum. These are California, $12,571,900; Colorado, $5,539,021; South Dakota, $3,942,495, and Montana, $2,966 572. The figures are those reported by the U. S. Mint officers and agents for the year 1892. The relative product of these States has differed little in the past few years. The closing of the silver mines would reduce the gold product of Colorado more than any of the others, since some of her gold issues from her silver mines. California and South Dakota get some of their gold product from silver properties, so there is not apt to be any reduction in gold output from these two States. Montana will not be affected so much as Colorado in tbis respect. Both in Colorado and Montana more search than usual has been made for gold ores, and this interest will be hightened in the future by reason of the closing down of the silver mines.

From the figures given above, it will be noticed that California is still a long way ahead of even the second one in the list—Colorado—in the matter of annual gold product. There is no probability of any reduction in the annual yield of California, because all its gold comes from gold mines, and none from any worked for silver, which might be closed down. In fact there is a strong probahility that the yield of California will be materially increased by reason of the partial resumption of work in the hydranlic mines under the provisions of the Caminetti act, which is now in force. None of the minea of the State have yet started work under the requirements of this law, though preparations are heing made to do so.

It reqnires no argument after a casual glance at the figures of production qnoted, to show that California is pre-eminent in gold mining. It always has been in that position since gold was discovered within its boundaries. The exhaustion of the rich placers of early days naturally reduced the annual prodnct of the State; but for a number of years the amount yielded has varied little. It is now susceptihle of increase, however, for the reason stated.

If, then, as may reasonably be expected, mining investors are now in search of gold properties, this is the State to which their attention will natnrally be turned. South Dakota will douhtless attract many, but it ia not a fact that it has "conditions which exist nowhere else in America." There is no disposition to detract from the known merita of the Black Hills gold-mining region, but a richer and more productive one exists in this State, and California should he the first to feel the influence of the desire to ohtain gold-producing properties.

REDUCTION WORKS DESTROYED.—On Sunday last the Pioche Consolidated leaching works and mill at Bullionville, Nev., were entirely destroyed by fire. The flames were first seen at the eastern end of the mill, about noontime. The response to the first cry of fire was almost instantaneous. The pumps were in motion in 30 seconds, and before the whistle sounded everything at the engine-room was under perfect control. Forty thousand gallons of water in the fire tanks above the mill, a thousand feet of hose and connections as additional precautions proved altogether unavailing. While nothing is known as to how the fire started, it is supposed to have been caused by some sparks falling in the woodpile east of the building. The mill had just been improved at an expenditure of $50,000, making a total cost of $150,000. It was practically a perfect modern leaching plant.

Ancient River Beds of the Forest Hill Divide.

The Forest Hill Divide, one of the nnmerons spur-like ridges of the western flank of the Sierra Nevada, is in Placer county, between the north and middle forks of the American river. The ridge line is uuiformly graded and unbroken for 25 miles or more, extending from an altitude of 5,800 to 2,300 feet above sea-level. Midway between these points the ridge branches, the northerly branch being the Iowa Hill Divide, and the southerly, or main branch, the Forest Hill Divide proper. An examination of the district shows that the hases and main bodies of these ridges are composed of metamorphic rocks of graat age, and that there are commonly exposed on the summits large accumulations of volcanic material and extensive river deposits of a comparatively recent geological epoch. In a popular sense, however, these deposits are decidedly ancient, and they have been appropriately credited to an ancient river system. A characteristic cross-section of the Forest Hill Divide is given in Fig. 1 of the accompanying engravings, which we take from an article by Ross E. Browne, M. E., in the last published report of the State Mineralogist, condensing also the descriptive matter.

The River Deposit consists of well-washed bowlders, pebbles, and sand, composed of the harder materials eroded from the bedrock—mostly quartz and siliceous rocks. Clay strata are of frequent occurrence, particularly in the upper portion of the deposit. Trunks of trees, commonly cedars and oaks, are found imbedded in the upper layers, either petrified or somewhat lignitized. Certain layers of the gravels thus formed have become strongly cemented, owing, probably, to the percolation of siliceous and calcareoua waters. The color is gray, blue, green, reddish brown, or white, according to the material, as well as the degree of oxidation of the iron in the cementing substance.

Gold occurs throughout this deposit in the form of rounded nuggets, scales, and dust. This occurrence is the result of the breaking and grinding of fragments and bowlders of the gold-bearing portions of the bedrock. By a natural process of concentration the bottom layer of each deposit of gravel has become, as a rule, the richest.

That these auriferous gravels are river deposits, was but one of a number of theories advanced during the first decade of active mining operations. The theory was well established, however, by Professor Whitney, in his earlier work as State Geologist, and the accumulating evidences have long since become conclusive.

The Volcanic Cap consists of massive layers of beds of light gray, reddish brown, and dark-colored cements and conglomerates. It contains large bowlders and fragments of volcanic rocks, and in its bottom layers occasional trunks and branches of trees somewhat lignitized. It carries no appreciable quantities of gold, and is, in fact, the barren material of the district.

Between these massive beds are layers of gravel, marking distinct periods in the flow.

The Forest Hill Divide has been for thirty-nine yeers an active field for mining enterprise. There have been exposed by hydraulicking many sections of the river deposit and extensive areas of the river beds; and by drift mining a number of the channels have been explored and worked continuously for a mile or more of their lengths.

Of the mining terms used it appears necessary to define a few only: "Channel" refers to the deeper portion of the continuous trough-like bed of the river; "rim" to the sides of the trongh, from the line above where the bedrock begins to pitch down, to the shore line of the bottom layer of gravel filling the channel; "npper lead" to an upper layer of pay gravel; "bench gravel" to a patch of an earlier deposit of gravel remaining in place after the greater portion has heen washed away.

The network of channels under the volcanic cap is rather confusing. There are evidences of a numher of channel systems, each representing a partial or complete displacement of the stream, a distinct cut, and a special deposit of gravel.

The series of volcanic eruptions in the high Sierras had a marked effect upon the watercourses and has enabled a ready grouping of the channel systems according to three important periods, covering the time before, during, and after the series of eruptions.

Prior to the first important flow of volcanic cement, this period is represented by a system of continuous valley-like depressions in the bedrock, from a thousand to several hundred feet in depth and several miles in width, and containing broad river heds filled with gravel to very considerable depths. The rivers, in eroding the bedrock and forming these depressions, left a succession of broad, flat benches with shallow accumulations of gravel. The channels naturally followed, to a great extent, the belts of soft slate. This slate is easily eroded, alacks readily, and is washed away in the form of a fine silt. Quartz is the only important material contained in the helts which is hard and permanent enough to resist the destructive action of the current. Owing to these facts we find in the filling of the channel, for long stretches, quartz gravel and qnartz sand almost to the exclusion of other materials. The white channel of the Mountain Gate and Hidden Treasure mines is a striking example (see Fig. 3).

The channel is filled to a depth of 50 feet, and a width of one-third of a mile, almost exclusively with smoothly washed bowlders, pebbles, and sand of pure white quartz. On top of this, to a depth of 150 feet or more, and an original width probahly exceeding a mile, the filling is quartz sand and sandy pipe-clay. The course of these belts of soft slate being south, or somewhat east of south, and not entirely continuous, and the general slope of the surface being to the southwest, the channels occasionally break across the harder belts of bedrock. The quartz gravel decreases in quantity, and there are substituted pebbles and bowlders of equally hard siliceous metamorphic rocks. There appears no conclusive evidence of the occurrence, during this period, of any disturbances to cause a wide diversion of the watercourse, and Mr. Browne is unable to say whether the period is represented hy one large channel system only, with its tributaries, upper leads, and benches on the valley slopes, or by several such systems.

The first important volcanic eruption in the high Sierras changed the conditions. A mud composed of fine volcanic material was delivered to the river bed and washed down its course, spreading over the gravel to a considerable depth, solidifying and sealing the river deposit. The streams were diverted by the cement cap thus formed, and the first period came to a close.

Second Period, or period of the series of volcanic cement flows.—The capping of the older channel deposit occurred in a succession of flows. The watercourse was several times diverted by the heaping masses of volcanic materials. During the intervals between the periods of volcanic eruption both shallow and deep narrow channels were cut, sometimes following and partly obliterating the older deposit, sometimes crossing and leaving the deeper portion of the older bed altogether. Some of these later cuts are higher than the earlier; several of them, however, passed entirely through the older deposit and 50 to 100 feet deeper into the bedrock. (See Figs. 3 and 4)

The " blue channel " and the " volcanic gravel channel," shown in the section, represent two such cuts. The " blue channel " contains, in its lowest depression, five to fifteen feet of bedrock gravel of a grayish-blue color, and on top of this eighty feet of cement, then a layer of four five feet of bedrock gravel; and on top of this again, cement. The " volcanic gravel channel " contains a large hody of coarse gravel, composed mostly of volcanic rocks, and to a small extent only of bedrock. These two channels represent distinct systems. The volcanic gravel channel is doubtless the later of the two; possibly the latest of the deep channels of the period. The final bed of the period was filled with coarser cements and conglomerates to a great depth. Volcanic eruptions in the high Sierras ceased altogether, and thus the cause of frequent diversions of the watercourse disappeared.

Third Period, immediately following the last important flow of volcanic cement and extending to the present time.—There still remains of the volcanic cap from three hundred to one thousand feet in depth. The ancient valley was filled to depths even greater than these, and there resulted a wider and more permanent diversion of the watercourses than heretofore. The streams started new channels, probahly along the marginal lines of the cap, cutting across the cap at the juncture of tributaries of early periods, and ultimately obliterating the greeter part of the deposits of the first period and a large part of the deposits of the second period. These streams, undisturbed by volcanic activity, have continued to cut, forming eventually as the forks of the American river the deep canyons of the present day.

Auriferous Conglomerates of the Witwatersrand.

The Pecullar Occurrence of Gold in the Famous South African Camp.

At a recent meeting of the Federated Institution of Mining Engineers in London, Mr. F. G. Shaw read a paper on tbe auriferous conglomerates from which so much gold is now being taken at tbe South African Camp of Witwatersrand. This paper will interest many gold miners in this State, for though the material carrying the gold has to be crushed in mills, it is conglomerate or gravel and not quartz, though it is mined like quartz, and is different from anything we have in California.

In Mr. Shaw's paper certain theories were advanced as to the manner in which the auriferous conglomerates of the Witwatersrand have been formed, and in wbich the gold now found crystallized in tbe matrix of these conglomerates has been deposited. These auriferous conglomerates were first worked in 1887, near Johannesburg in tbe Transvaal, and from an isolated part of the extensive conglomerates which are common to the sandstones of South Africa. The basin has an east and west length of about 50 miles and a supposed breadth of about 40 miles. The east and west

ends are very much dislocated and faulted. The dip of these conglomerates appear to be governed by intrusive masses of trappean rock, which run parallel to the northern and southern outcrops, and have elevated the edges of the beds to angles varying from 12 degrees to 60 degrees. These seams, the author expects, will assume a horizontal position at comparatively short distances from the tilted outcrops, save where locally displaced hy intrusive masses of igneous rocks which are occaslonally seen cropping out. Although no deep horings have proved the existence of these beds ln the middle of the syncline, the continuity of their upturned edges and the regularity of their disposition, together with their known extent over South Africa, have impressed geologlsts with the conviction of their existence, and from 2000 to 15,000 feet have heen assumed as the probable depth reached by the lowest levels of this syncline.

The assumption is that these beds of conglomerates exist over an area of nearly 2000 square miles; the regularity of their width and character is well proved; and the gold up to the present time appears to he regularly distributed through the reefs. The importance of this field can he hest understood by the output of gold which was for its sixth year 1892, 1,210 868 ounces, a greater output than any other single field of slmilar age in the world. During the first year of its history, 1887, this field produced 23,115 ounces. This is equalled hy the present weekly output. The conglomerates of the high veldt of South Africa, the manner io which they were spread over so vast an extent of country, and the precipitation of gold in them is a most interesting subject, but as the main reef seam at Johannesburg, with the attendant parallel seams, are the most interesting from their auriferous character, this paper will he to a certain extent confined to them. Up to the present time geologists and mining engineers have alluded to these conglomerates as being a sedimentary or sub-aqueous deposit and the gold, if they mention it at all, as being of an alluvial character and mechanically deposited. On this latter point Mr. C. J. Alford is, perhaps, an exception. In his hook on *The Geological Features of the Transvaal*, he says, "it appears certain that the gold was not transported to its present position in the form of native gold by the action of water; its origin is a curious and interesting problem." With reference to the conglomerates themselves, the terms sedimentary and sub-aqueous are hoth too indefinite, and the author prefers to assume that these conglomerates have been spread over the large surface in which they now exist and with the regularity which is one of their notable features, by a sea-heach action. The general assumption has been that they have been thus spread over the sandstones in which they are conformably interbedded by the action of rivers, or currents in the seas, at the bottom of which they are supposed to have been deposited.

While the action of rivers undouhtedly accouots to a great extent for the transportation and collection of rounded pehhles, gravels, etc., in all parts of the world, no river action, that the writer has any knowledge of, could have so regularly spread over so large an area the seams of pebhles uow forming these conglomerates. Even if they existed only io the basin of the Witwatersrand, a river at least 45 miles wide and of most peculiar character would have had to exist, which for a certain period would have had to deposit over its eotire hed a uniform depth of pebbles, and then have had to deposit over the same extent a layer of sandstone for even a longer period, this action again being followed by the deposition of another layer of pehbles, then by another layer of sandstones, and so on, uotil these numberless layers of conglomerates, saodstones, etc., had been deposited. He knew of no analogous pheoomena in any river hed, and even were such phenomena known on a small scale, he could conceive of no river whose bottom would he so regular and uniform as these layers of sandstones and conglomerates would imply, especially when the more violent action of rivers and currents in those days are considered. These facts should dismiss the river-hed theory as being improbahle, and eoable the writer to turn to the actlon of currents existing in a sea, by the aid of which pebbles hrought to the edge of that sea would be spread evenly over an immense distance on its hottom. Such a regular layer of pehhles, which marine research has not yet discovered, would take a considerable number of years to form, and would have to he followed by a total cessation of pebble deposit, a layer of sandstone detritus taking its place and being deposited io the same ocean, these would then have to he followed in successive order by pebble and sandstone deposits uotil the parallel seams now fouod had been formed. This view would necessitate a current in the ocean so regular in its strength and action as to carry these pebbles smoothly and eveoly over the greater part of South Africa. No such current actiou is known at present in the ocean, the general tendency being to form banks and to heap up such coarse detritus as pebbles instead of laying them eveoly over the floor of the sea, and certainly no river flowing into an ocean would by its own action be able to spread its burden except in the vicinity of its mouth. The writer could therefore accept either of these theories as beiog the reasonable and common sense explanations of the distribution of these conglomerates, and he preferred to assume a progressive seabeach action, which gradually spreads the pebbles brought down by the rivers, etc., from the, probably at that time, highland of Central Africa, over the theo low-lying ground of the South African continent.

The author then went back to the time when our sphere was in a molten state surrounded by ao enormous thickness of atmosphere containing in suspension all the minerals whose point of evaporation was below that of the atmosphere, and gradually losing by radiation a portion of its heat. The formation of a film or crust would, he said, be the first real change on its surface, and as this crust became sufficiently thick to resist for some time the ebullition of the molten mass below it, the exterior portion would gradually become sufficiently cool to allow of the condensation of these various gases, minerals, etc. Many ages would pass during which gigantic igneous eruptions would take place, upsetting and distortiog the the existing rocks until at last the crust was continuous and strong enough to bear a certain superincumbent mass. As soon as the temperature would allow seas would rest on this crust, eruptions would still take place, and hydrothermal phenomena would still be common; but the land would gradually hegin to be of a permanent character. The erupted rocks would harden into hills, etc., upheavals would remain permanent, and depressions would become greater, and the early hydrothermal rocks would hegin to appear, so that in course of time low continents would exist as dry land, and the early sedimentary rocks, mudstones, shales, clays, etc., would be formed. Thus the contlnents would make their appearance, and the early sedimentary rocks he deposited, and on them would be formed in course of time the first sandstone rocks lying horizontally at a little ahove or below the then sea level. These sandstones are found over the whole of South Africa in unbroken layers on the high veldt, with traces of their existence in and over the low veldt, and it may be assumed that the same phenomenon has been responsible for their existence, and that the land ahout the time of their creation was suhjected to the same laws. These sandstones were undoubtedly deposited under the sea action, and it must be assumed that the then elevation of the tongue of land of South Africa was very little, and that it prohably existed as a low land lying to the south of the tropical parts of Africa, whose rivers would carry down the vast amount of pehhles, now spread over and among the sandstones, by the retreating action of the sea heach helonging to the same ocean which deposited the sandstones.

The most generally accepted theory is that the sandstones were formed at the hottom of the sea (which the few fossil remains found in them confirm), and that the material forming the coal measures have heen formed by the tropical growth of vegetation. The operations of an advancing sea over snch low lying lands, fed as it would he by rivers bringing down pehble detritus, slowly creeping over the land, and succeeded by a retreating sea heach action, would surely be accompanied with that of settling the light detritus brought into it as a sandstone deposit, and the spreading out on its edges of a uniform layer of pebbles (oow turned into conglomerates hy the subsequent infilterating action of siliceous waters). In those places in which the inflowing rivers travelled through countrles rich with vegetable growth bringing down in their waters an immense quantity of vegetable matter and gradually laying it down as a heach llne in the retreating course of the sea, making it comparatively speaking a level bed rich with vegetable seeds and with every facility for hringing forth the luxurlant growth from which our coal seams have heen made, during which time would be formed one of those non-continuous lenticular heds of various horizons, which would under the pressure of the superincumbent mass of sandstone be turoed into the coal and shale seams now found in South Africa (until the return of the again advancing sea-beach line many thousands of years afterwards).

The theory which might account for such an encroaching and retreating sea would probably be the gradual elevations of the land, followed by suhsequeot depression, leaving the land at one time exposed to the air, and afterwards covered by the ocean. Whatever was the cause, South Africa has uodoubtedly heen alternately covered hy sea-water and exposed to the atmosphere, and whether the land was alternately elevated and depressed, or otherwise, the sea must have come and gone and a sea-beach action heen thus created. The appearance of the low veldt bears ample testimony to this fact, the mountain ranges bordering the high veldt plateau of South Africa showing by their great denudation the erosive action of the advancing and retreating ocean.

The next and most interesting point is the manner in which the gold has heen deposited in the conglomerates. The author has io his possession two pebbles taken from these cooglomerates, which each cootain a colour of metallic gold. These pebbles prove that from whatever source, and from what distance brought, some at least were gold-hearing, therefore a certain amount of free gold would be mechaoically deposited in these seams derived from the broken matrix of the more friable and smaller pehhles, by the grinding action of snch a sea-beach as described. Such a class of gold would be fairly well distrihuted and would present the rounded appearaoce of alluvial gold. The gold, however, which is thus accounted for, forms but a small proportion of that carried in the reef. Mr. Alford says in his work, that "so far as he has noticed the gold is almost invariably in a more or less crystaline form, the cube in its defined forms being more or less detectable." The result of the author's investigations have been to confirm those of Mr. Alford, and led him to a careful study of this subject, and it was only after a diligent search that he became coovinced that the character of the matrix now holdlog the pebbles together had altered since those pebbles were origioally deposited and that the siliceous matrix now in the cooglomerates was pseudo-morphic in character. He is therefore inclined to believe that the original matrix, whether of argillaceous, calcareous, or felspathic nature, must have been displaced and a pseudo-morphic matrix carrying gold, sulphur, iron, etc., has taken its place, and his reasons for thiokiog so are as follows: In the oxidised as well as the unoxidised portioos of these conglomerates the pebbles are held apart by a distinctly crystalllsed matrix of silica. Now, in whatever manner these beds were spread over so large an area it cannot be imagined that the pebbles themselves sunk ioto a firm, jelly-like mass of silica and remaioed more or less suspended in it, even if oxide of silicon ever assumed so consistent and glutinous a character.

It is probable that an after crystallizatioo of the matrix must have taken place, together with a deposition of its containiog minerals, and may be accounted for in the following manner: After the gradual laying down of these conglomerates, etc., intrusion of igneous rocks took place, and the vast horizontal beds of sandstooes, etc., were in some places broken up and tilted, as in the Witwatersrand basin, and so acquiring a dip would either form natural dralns for iofiltrating surface waters or funnels through which the underground thermal waters, laden with their store of minerals, would force their way upward (through the fissures dislocating these seams, and caused by the upward action of trappean rocks), and reach the surface. In either case the silicon contained in these waters would crystallize in its passage through the conglomerate, and form the matrix that contained the minerals now found.

The author then further discussed the question of solutions containing gold, and concluded hy stating that if hls theories as to the pseudo-morphic character of the matrix of the Witwatersrand reefs are correct it is probable that reefs will be found of considerable value and extent in the vicinity of the intrusive dykes which have broken through the sandstones, and his theory will certainly warrant a greater faith in the continuity of gold in these reefs than when it was thought to he of an alluvial character and mechanically deposited.

Mr. Halse said it might interest membors to know that an auriferous conglomerate deposit was now being formed along the bottom of the Ancobra river, which ran into the sea. He did not advooate a river theory for the origin of the hanket formations, but merely showed that it was not impossihle. As for the uniformity of the conglomerates, he helieved they were not of uniform thickness, but sometimes wedged out entirely, and in certain of them the pebbles were of a much larger size than in others. The hankets of the west coast of Africa exhibited little or no metamorphism, faults were rare, and although the beds dipped at an angle of from 30 degrees to nearly vertical, no volcanic rocks occurred in the immediate vicinity to account for this.

Mr. Gibson said the reefs were not consistent or parallel seams, nor was the field a simple field like a coal basin. The heds were very much twisted, and moreover, no single reef was equally rich throughout. There were rich pockets, but not such rich pockets as were met with in quartz veins. The whole of the fields were very much more complicated than had hitherto heen supposed. The heds were not horizontal. The speaker believed the conglomerates were of alluvial origin.

Mr. Henry Louis takes issue with Mr. Shaw, and in a letter to the *London Mining Journal*, commenting on the above paper, says:

"Mr. Shaw makes a statement to the following effect: 'Up to the present time geologists and mining engineers have alluded to these conglomerates as being a sedimentary or suh-aqueous deposit, and the gold, if they mention it at all, as being of an alluvial character and mechanlcally deposited.' I shall be glad if you will permit me to point out how inaccurate this statement is. The first information, so far as I know, regarding the geological character of the banket beds of Witwatersrand in any British puhlication is contained in some hrief notes contributed hy myself to *The Mining Journal* of November 13, 1886 (page 1325). I am not aware that the statements there made by me have ever been controverted, and they are diametrically opposed to the views ascrihed by Mr. Shaw to mining engineers in general.

"The gist of the observations and deductions contained in these notes of mine is to the effect that the banket is 'just such a deposit as may fairly be attributed to the agency of mountain streams depositing in a lake the detritus with which they are laden. It is very noticeable that the gold in these banket heds is not, or only very slightly, water-worn, as shown by microscopic examination, and that no coarse gold occurs in them.' I further pointed out that the formation consists of 'beds of conglomerate more or less consolidated, and bearing gold partly in the quartz pebhles, of which the conglomerate largely consists, and partly in the siliceous material which surrounds these pebbles aod cements them tcgether.' My conclusion at the time was that 'further explorations are, however, necessary to prove whether these curious deposits carry gold uniformly in depth, or whether their auriferous contents are not due to the deposition of gold *in situ* subsequently to the formation of the deposits, owing to the infiltration of gold in solution from the surface. The highly microcrystalline character of the gold suggests this latter hypothesis.'

"You will notice that these views are exactly the opposite of those which Mr. Shaw sets himself to controvert, and with reference to them I hope that you will hear in mind the early date at which they were written (a year before the conglomerates were first worked, according to Mr. Shaw), and the great difficulties which heset any geologist who then attempted to study these formations. I do not believe that there was at the date of that, my first, visit (July, 1886) a shaft on the Raod 20 feet deep, practically all the work having been confined to surface trenching. Nevertheless I had even then little douht that the banket beds would continue in depth, although I was by no means sure that they would continue to be equally auriferous. I still venture to think that the subsequent studies of other geologists have only confirmed the views then first advaoced by me, and which I have not yet seen reason to seriously modify; in fact, they are in some respects the same as those which Mr. Shaw is now setting forth, and I cannot but hold that where we differ the balance of probabilities is in my favor. Thus I think that most geologists will agree with me in ascribiog to these beds a lacustrine rather than a marine origin, what evidence there is on this point, mostly negative it is true, beiog decidedly against the latter assumption. I also believe that my opioion, above quoted, to the effect that most of the gold is not mechanically deposited alluvial, contemporaneous with the pebbles of the beds, but that it has been precipitated in its present position, subsequently to the formation, perhaps even to the upheaval, of the deposit, is generally accepted by independent observers, and that the crystalline character of the gold, first pointed out by myself, is recognized as sharply distinguishiog these deposits from cement beds.

"I need hardly add that, at the time when my original notes were writteo, no such thing as a speck of pyrites had yet been seen in the Rand baoket. The subsequent discovery of its pyritous nature in depth has naturally given greater precision to theories regarding the agencies which have deposited this crystalline gold, but it has not in any way controverted, but rather has amplified, my cruder early views on this subject."

Electrical Power for Mining in Nevada County.

Nevada county is the principal gold-producing region of California, having more productive mines within its boundaries than any other county. The section around Grass Valley and Nevada City has many small as well as many large mines and there is need for power in them all. The development of electric transmission in the past few years has shown that it is possible to utilize the water-power of the South Yuba river by generating electricity and transmitting it to Nevada City and Grass Valley, and a company has been organized at the latter place to do this. The company owns the river from section 24 to section 27, township 17 north, range 8 east, M. D. M. (where the "fall" averages 90 feet to the mile) and all the land on the south bank of the river through which their flume will pass. They claim 10,000 inches of water, which, when diverted at a point in section 24 and carried a distance of three miles through a flume to a point in section 27, will give a fall of 250 feet that will generate over 6000-horse power. The power is to be transmitted from the point of generation on the South Yuba river via Nevada City three and one-half miles distance to Grass Valley, and the mines four miles farther.

It will be seen from the accompanying diagram that from the dam to the power station, a distance of three miles, the natural trend of the river is southerly, thus saving two miles in the length of the wire and shortening the distance that the power is to be transmitted.

The course of the pole line is designated by the line starting at the power station, and running to 1, thence 2, 3, 4, 5, 6, 7 and back to 1 again and completing the circuit. Each square in the diagram represents a section one mile square.

1. Group of mines on Deer creek, one-half mile west of Nevada City, comprising the Nevada City mine, Wyoming, Spanish, Champion, Merrifield, Home, Monntaineer, Providence, etc., etc. This will be a distributing point and from it will be switched sufficient power to supply Nevada City with electricity.

2 Town Talk Summit being the highest point on the high-road hetween Nevada City and Grass Valley, also the summit on the N. C. N. G. R. R., here will be erected a 50-arc light dynamo to light with electricity the Nevada City and Grass Valley wagon road, and from this point power will be transmitted to the Gold Flat, Merrimac and Pittsburg mines.

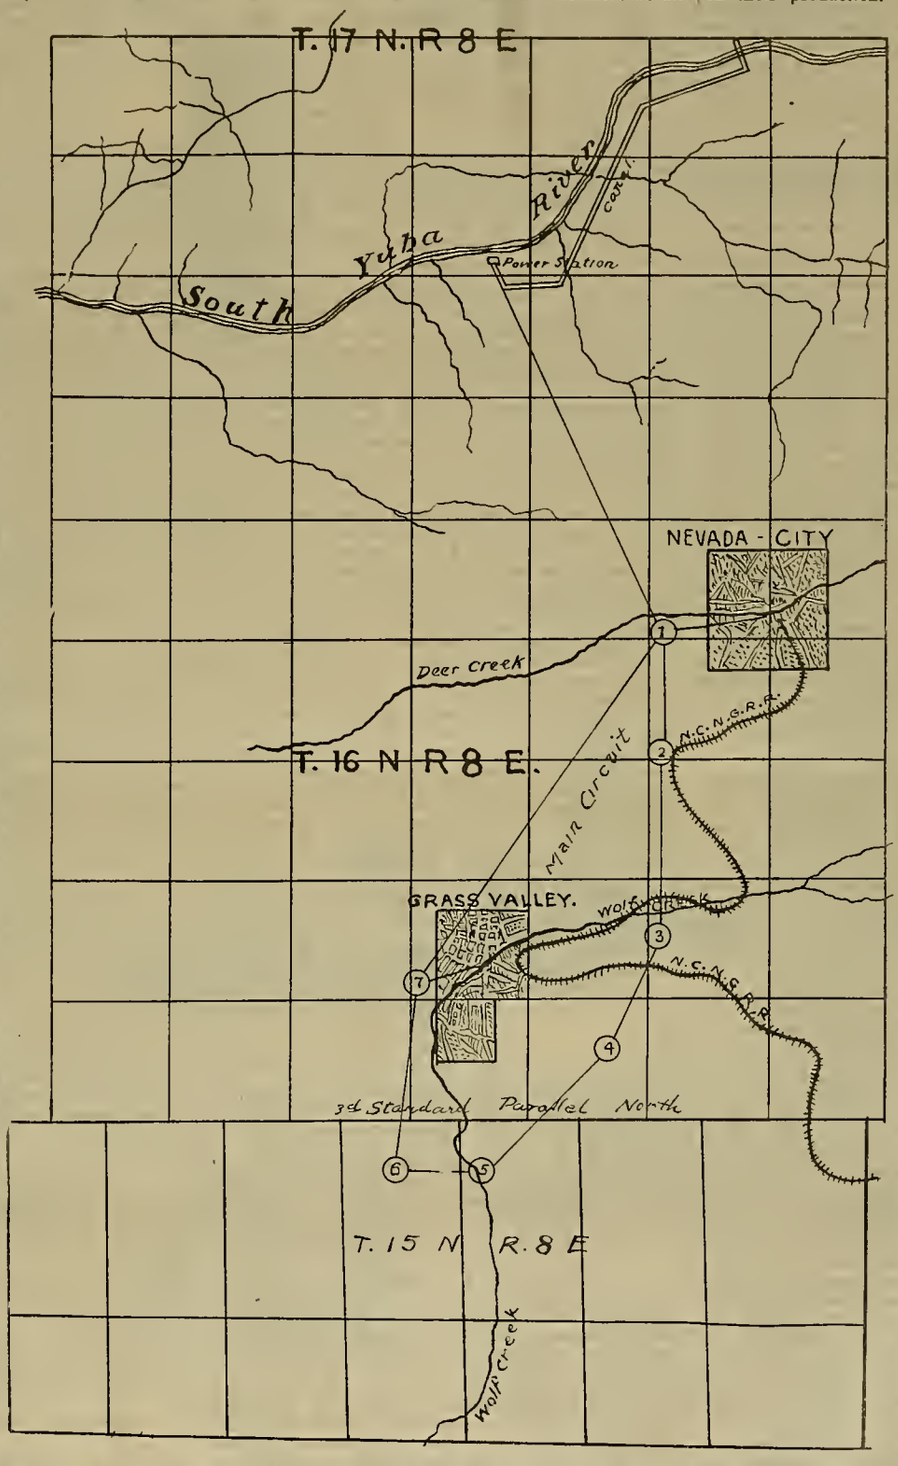
3. The Idaho, Maryland group of mines.

4. The Empire, W. Y. O. D. and Pennsylvania group. From this point power will be transmitted to Osborne Hill, Conlan, Lafayette, Centennial, Green Mountain and other mines, taking in all properties lying in a southeasterly direction from Grass Valley.

5. The Omaha and Lone Jack group. From this point power will be distributed southerly to the celebrated Allison Ranch mine, taking in the Illinois, Hartery and other mines.

6. The North Star mine; thence to:

7. The Peabody mine, taking in on its route the Rocky Bar, New York Hill, Hudson Bay, Tribute, Massachusetts Hill, Stockbridge, Scadden's Flat and Gold Hill. From 7 the line will pass through Grass Valley townsite and return to 1, thus completing the circuit. It will be seen that there is quite an extensive field for the consumption of power all within a compact circle of seven miles in diameter.



Three different electrical companies are competing for the contract to put in the entire electrical machinery and have each offered most favorable terms to the company. Several estimates have been submitted that are at present being examined by Prof. F. C. Hasson, the company's electrical engineer. The dam will be constructed as soon as the stage of the water in the river will permit. It is not the intention of the company to generate electricity except as it is contracted for. Contracts have already been made for 750-horse power.

The company will erect and maintain a number of electric arc lights, each of 2000-candle power, at a distance from each other not to exceed 500 feet apart, along the high-road between Grass Valley and Nevada City for the next five years, said lights to be burning all night without any expense to the county. This is almost entirely a Nevada county enterprise, and the president of the company is Alf. Tregidgo, who is also president of the Nevada County Miners' Association, the largest one of the kind in the State. When this electrical plant is completed it will be of great benefit to the many miners in need of cheap power for operating hoists, pumps, mills and other machinery.

A Department of Mechanics.

Some time ago, in discussing the friction that exists between the engineer and the officers of the navy, we stated that we thought there were some points in favor of the establishment of a department of mechanics under the government, which department should have charge of all mechanical work for the government.

The more we consider this matter and the more we discuss it with others whose opinions may be supposed to be worthy of consideration, the more fully are we convinced that such a department of the government would be very advantageous in many ways.

The time has now come when the manufacturing interests of this country are scarcely inferior in importance to any other, and we think that any one who will take the trouble to examine into the matter a little will find fully as many reasons for the existence of such a department as for the existence of such a department as that of the Interior, Agriculture, Post-office or most of the others.

Within this department we think that all mechanical work of whatever kind done by the government should be executed, instead of having it, as at present, scattered around among the departments, each one making or contracting for what it needs, whether it he naval vessels, cannons, small arms, coast survey instruments, astronomical instruments, or mail bags. It would not follow from this that all these various kinds of work should be done in one establishment, nor that all of this work should be actually done by the government, but the mechanical department should have supervision over all of it, and this department should be in charge of a chief officer and assistants qualified by nature, training and experience for the work they have to do.

For instance, we believe that the legitimate and only proper function of the Navy Department is to navigate and fight naval vessels, and that the making and repairing of naval vessels and their armaments might better be left to mechanics and engineers. By the same token we think that the proper business of the army is to carry on campaigns and fight battles, and that the making of shoulder guns, swords and cannons should be left to those who can make an exclusive specialty of such arts as are concerned in their production. We believe that the rank and title of Commodore for a mechanic and engineer is a meaningless anomaly, and the employment of an army Captain in making guns an absurdity. A man who attains distinction in mechanical science or engineering should have a title and honors which mean something within the field occupied by him, and which should net be complicated by the use of the same title by men occupying entirely different positions, involving duties as different as is night from day.

Not long since a Captain was appointed to a position, the duties of which are not, or at least should not be in the least military, but purely mechanical and executive. A published statement of his qualifications for the position was as follows:

"He was 17 years old when he entered the Naval Academy at Annapolis, and was graduated at the head of his class at the outbreak of the Civil War, so that he had an opportunity to see real service from the beginning of his career. In 1862 he was promoted to be Second Lieutenant. He served during the war in the Potomac flotilla, in the Gulf squadron, and in the monitor fleet at Charleston, S. C. He was one of the survivers of the "Patapsco" when she was blown up by a Confederate torpedo and lost two-thirds of her men. His services since the war comprise duty in the European squadron twice and some years in American waters, including a voyage on the 'Congress' to carry relief stores to the explorer, Hall, and the command of the 'San Francisco.' He has also been in charge of the torpedo station at Newport, of the Annapolis academy, and of the Washington Navy-yard. He is said to be a strict disciplinarian."

Now we should say that this record is highly creditable to the gentleman referred to. But is it not self-evident that a man having such a record should remain during the active years of his life in a service where the record would be of some use to him, and where it would be proof of fitness for the position occupied? while positions involving a knowledge of mechanical science should be filled by those who had made their record within the field of that science? The captain referred to is competent, no doubt, for the position to which he has been appointed, and is very possibly the best man that could have been selected for the place from among those who are eligible for it. But no mechanic, no matter what his attainments, was or is eligible, which seems to us to be an absurdity. All through the connection of the government with mechanical matters such absurdities are to be found. Mechanics and engineers as such must be subordinated to officers who, in the nature of things, must know far less of mechanical matters than is known by those who make a specialty of mechanical matters, and whose record and career are entirely dependent upon their knowledge of them. We believe this is decidedly unfair to mechanics. We believe that the development of naval vessels and of all kinds of fighting machines, large and small, is due mainly if not entirely to mechanics and engineers, and that they should have the credit of it. They can secure this probably only through the establishment of a department of mechanics, which should stand upon the same footing as the other departments of the government. Other advantages would probably result from the establishment of such a department which need not be mentioned at this time, but which will suggest themselves.—American Machinist.

A PRECIOUS CARPET.—Stock was taken at the United States Mint in this city last week preparatory to the retirement of General Dimond and the assuming of duties by Superintendent Daggett. The money in the vaults was

not counted, as the official seals on the doors which guard millions in gold and silver speak for themselves. The carpet in the coiners' department was burned, according to the usual custom every four years, and $4400 worth of the precious metal was obtained. This was cast into a bar and placed on the inventory as a part of the Mint's assets. Four years ago when General Dimond assumed the superintendency the carpets "panned out" about the same amount.

Pocket Mines.

TO THE EDITOR:—When gold was first discovered in California, and for several years following, placer mining was the only branch of the mining industry practiced or known to the thousands who labored with pick, shovel and pan to roh mother earth of her golden treasure; and, if any other branch of mining was known to a few of the great multitide of miners who rushed to the gold fields, they either forgot their knowledge of that branch or did not consider it worth bothering with, when gold could be obtained so easily in the placers as it was in those days. But, as the years rolled on and the best placers were worked out, many of the miners who had found quartz, rich in gold, in the gulches and ravines where they had worked, began to look for the gold in quartz. Their researches were rewarded, and that period marks the first step forward toward the development of the many rich quartz mines we have on this coast to-day.

Ever since that period when quartz mining first attracted the miners' attention on this coast, science has advanced with rapid strides in this industry, until to-day the Pacific coast, and California in particular, leads all other parts of the world in lmprovement and progress in this industry. The latest improved machinery and methods of working gold and silver ores are Pacific coast designs, and the MINING AND SCIENTIFIC PRESS has been the chief factor in bringing this stage of advancement about, by giving to the world, through its columns, a reliable and authentic account of all the different discoveries, processes, improved mechanical appliances, etc., which have been invented from time to time. The three different branches, viz., placer mining, quartz mining and pocket mining, are each an interesting study and a science, so to speak, within themselves. At the present time, pocket mining is attracting more attention among prospectors and those in quest of knowledge pertaining to mining than elther of the others, for the reason that it is new and has not yet reached the advanced stage which the other branches have; consequently there are more opportunities for the prospector to make new discoveries and realize a profit from such for a small outlay than there are in prospecting for placers or milling propositions in quartz. All the capital the average "pocket hunter" requlres is a pick, pan, shovel and gruhstake; for, if he is successful in finding a pocket, he generally gets all the gold in a short time without further expense.

Pockets occur under certain conditions in a certain class of formation, hence the term "pocket formation." This pocket formation extends along the mineral belt from Fresno county on the south, in California, to Douglass county, in Oregon, on the north, as far as it is known and pockets have been found. This pocket formation also occurs in places through Nevada, eastern Oregon, Idaho, Montana and Washington, and, in fact, in the most of the different sections where gold and silver are found, west of the Rocky mountains. Pocket formation invariably carries the following-named minerals hesides gold, and sometimes silver: Iron, copper, lime, sulphur, and, in many places, lead. As a general rule, the formation is a soft porphyry, or gray slate, which slacks and decomposes rapidly by exposure to the air and sun. Pockets vary in size in different localities according to conditions. But some people may ask the question, What is a pocket? So it would be well to explain what a pocket is before we proceed further. A pocket is a mass of valuahle mineral concentrated within a small space in a ledge, lead or vein; or, in other words, they are very rich spots in ledges, veins, seams, or feeders, while the rest of the ledge is either barren or very much lower-grade ore than those spots or bunches which are called pockets. While the majority of the pocket ledges are barren except where the pocket occurs, yet there are many milling propositions that carry a paying quantity of gold all through, that are pocket ledges. Pocket ledges generally cut or cross the formation, while in the same district the milling ledges run with the formation or course of the country rock. Throughout the coast mineral belt the course of the pocket ledges is nearer to an easterly and westerly direction, whlle the milliug ledges, on the contrary, run nearer to a northerly and southerly direction. This is more particularly noticeable in the northern districts, through southern Oregon and northern California, than it is in the other districts east and south. The chief minerals which predominate in the pocket formation through the first-named sections are iron and lime, and the formation itself is principally porphyry. The outer edge of this pocket helt ls so well defined in places that the experienced pocket-hunter can tell within a few feet of how far it extends. This statement may not be credited hy some of our skeptical mlning sharps, hut nevertheless it is a fact, for there are several places in Jackson and Josephioe counties, in southern Oregon, where small pockets ranging from $5 to $100 have been taken out on the bcrder, next to the granite and gneiss, and within 50 feet of those pockets—in granite and gneiss formations—small ledges or stringers, hearing gold tneir whole length, have been found. But all search so far has failed to discover a pocket or hunch on any of those stringers, while in the porphyry on the other side, a few feet from the contact of the gneiss and porphyry, or the granite and porphyry, the veins carry no gold except in pockets. The pocket helt through this section is very irregular in its width and course; in some places it extends several miles in width, while in other places it narrows up to less than a mile. The general course of the belt from Oregon across the Siskiyou range into California is almost in a southeasterly direction, crossing the Klamath river some elght or ten mlles west of Hornbrook and Cottonwood. There has only been a few milling ledges which have been worked to pay within the limits of this belt, and none of them carried the gold to the depth of 100 feet, while outside of the horder of this pocket belt, on the west side, we firmly believe that development of the ledges in time will prove that they become larger and richer as they go down.

In the series of articles to follow I will endeavor to illustrate, in plain language, the different theories of what causes gold to occur in pockets and what form them, and no particulars pertaining to pocket mining on the coast from Mexico to Alaska will he omitted.

ALEX. QUARTZ.

Asphalt Mines in Syria.

United States Vice-Consul Khouri, at Beirut, Syria, in a report to the State Department on the asphalt mines of that country, states that four asphalt mines are known to exist in Syria. One is situated in the vicinity of Hashaya, about 30 miles to the south of Beirut; the third is near Ain-Ettineh village, 70 miles to the east of Beirut; and the fourth is found in the valley of the Dead sea. Of these mines, the one at Hashaya is the most important, and the asphalt obtained from it is considered the best, with the exceptlon of that of the Dead sea, which floats in small quantities on the surface of the water and drifts ashore, where it is picked up hy the Bedouin Arahs.

Until 1860 these asphalt mines were almost entirely neglected; hut in 1864 the asphalt mine at Hashaya was leased hy the Turkish Govermnent to two native merchants—Messrs. Freige and Misk—for a term of four years at a rental of 80,000 piasters ($3520) per annum. The operations of this company did not prove very successfnl, lack of an adequate system of engineering greatly reducing its profits. In 1878 the mine was leased by the firm of Messrs. Tahet & Co. for four years at an annual rental of 250.000 piasters ($11,000). During these four years ahout 4,000,000 kilograms (4400 tons) of asphalt were extracted. At the expiration of the lease the mine was leased to another company, Absy & Co., for a term of ten years, commencing in 1888. The condition was that 65½ per cent of all the asphalt extracted should go to the agents of the imperial private treasury, the mine being the private property of the Sultan. During the last five years the amount of asphalt obtained by Messrs. Absy & Co. from the Hashaya mine is estimated to be 5400 tons. The company's success has been mainly due to skillful engineering and methods of excavation. No asphalt is at present extracted from the other mines in Syria, as the local Turkish authorities strictly prohibit their being worked.

When Messrs. Freige & Misk first worked the Hasbaya mine, the asphalt was sold in Europe at an average rate of $19.30 per 100 kilograms (220 pounds). Its present price in the foreign markets is hetween $8 69 and $9 65 per 100 kilograms. The Syrlan asphalt is subject to no tax except an export duty of one per cent. It is rumored, however, that a new rescript issued by the Sultan enjoins that no export dues should be hereafter imposed on that article. The exact quaotity of asphalt now in stock cannot he ascertained, as the parties who monopolize it decline to glve the figures. It is probable, however, that not less than 3000 tons are stored for sale by the agents of the imperial treasury and the mining company. The asphalt obtained from the Syrian mines is invariably exported to Europe and America in its natural state, without undergoing any process of preparation.

The following table shows the value of that exported from Beirut to the United States since 1882, when the first important shipments were made:

Year.	Value.	Year.	Value.
1882	$12,239 00	1890	$ 6,983 00
1883	11,576 99	1891	7,303 03
1884	6,095 00	1892	21,207 44
1885	3,176 30		
1889	1,958 17	Total	$70,588 93

During the years 1886, 1887 and 1888 none was exported from this consular district to the United States, owing to low prices in America and a scarcity in the supply for home consumption.

From statements made hy a number of reliable persons, it seems very prohable that asphalt exists in large quantities in all the mines which have been discovered, and that thousands of tons might be extracted every year if the local authorities would allow the mines to be worked.

An Old Timer.

The vicissitudes of life bring about many curious and interesting events. The peculiar conditions of early California life have been productive of many strange personal histories which are interesting if not instructive. Several of world's prominent millionaires got their start in Nevada county, and others mined here in early days and carried their blankets about from place to place in search of the fickle goddess of fortune. Many who were at different times millionaires are now compelled to work for the necessaries of life, having lost their fortunes in fruitless endeavors to find other and larger ones.

There is in Truckee a gentleman who went to Nevada City in 1850, and who for years was associated with the most prominent mining enterprises of that section. He opened several of the mines which in early days paid hig returns. He was able to draw his check for hundreds of thousands of dollars, and he started in life several men who have since become famous mining millionaires. He gave to John W. Mackay $164,000 for just writing his name. With this as a foundation, Mackay built that colossal fortune which enables him to live like a king and to call the world his home. Several smaller fortunes may he traced to this man's operations in Nevada county. There were various times when he might have left the mines with an independent fortune for himself, hut he had been seized hy the mining mania and invested again and again, only to find at last that the game had gone against him and that he was a comparatively poor man. He went to Virginia in the palmy days of the Comstock, hut the good things were all in the possession of men for whom he had paved the way. The remnant of his fortune went in stock speculations, and now he is contentedly working hy the day for a living, having philosophically accepted the reverses of fate.

This history might be repeated a thousand times, with only slight variations; and in nearly every case, as in this one, the individual will be found to he fondly clinging to some "prospect" somewhere, in the hope that before he dies he will yet have retrieved his place in the financial world. Vain delusion! and yet without it many a man would have nothing to live for. That hole in the ground is all that is left him of a long life of turmoil and struggle for gold. And, after all, is it not all they now need? Is it not what all of us shall come to sooner or later? The millionaire's money may not buy him a respite of a single minute. Of the houses and lands of which he may have called himself master, of the gold that jingles in his vaults, he can take none along. "Some six feet of sod" is all he will require, and then he and the pauper are again on an equality.—Truckee Republican.

The Great Diamond Mines at Kimberly.

Mr. James H. Balmer, of Kimberly, who is on a vislt to this country, gives some information regarding the diamond mines of south Africa and the methods of working them. The De Beers Consolidated Mining Company controls an output of diamonds which amount to $100,000,000 annually. Until a few years ago there were two diamond-mining corporations in south Africa, the De Beers and the Kimberley, hut the former bought the latter for $16,000,000, making payment with one certified bank check, and thus practically securing control of the world's diamond market. "The two mines now being worked by the De Beers Company," said Mr. Balmer, "cover an area of 36 square miles and reach a maximum depth of 1000 leet. Of course the market is entirely in Europe and America. Dynamite is employed in some places, hydraulic power in others, and the simple pick and axe in others. The labor in the pit is performed entirely hy male negroes, of whom 1000 are employed. They are in charge of white overseers, who also superintend the use of the dynamite. From the pit the rock is wheeled in barrows to a hydraulic elevator, whence it is carried to the drying fields above. These fields or levels are many miles in extent, and through all parts of them run moving endless chains to which the barrows are attached. These chains carry them, guided hy negroes, to all parts of the field. There the contents are spread flat upon the boards, and in a few day's time the intense heat of the sun relaxes the rock to a powder. From the wooden platforms it is carried to a washing-house, where the dust is placed in huge machines in which the dirt is washed away and the diamonds remain and gravitate to a common center, whence they are taken and packed for shipment to different parts of Europe.

"It is estimated that hundreds of thousands of dollars' worth of the diamonds are stolen every year hy the negroes, in spite of the extraordinary care taken to prevent theft and the penalties imposed for conviction of it. Every negro is made to sign a contract when he enters the employ of the company. It may be for three months or three years, but during all the period of his labor he is held a close prisoner. The entire mining property is inclosed by a harbed-wire fence of great height, and at each gate an armed sentry patrols his heat. Negroes are neither allowed in nor out under any circumstances, hut white men may come and go after obtalning permission. When the negro is about to leave the employ of the company, he is taken to a guard-house, where he is again imprisoned for several days. He is stripped naked and examined. They comb out his woolly hair, dig out his ears, his nose, and examine his mouth for hidden diamonds. They feel of his legs, his thighs, his arms, every part of his hody, and whenever a lump is discovered a knife is dexterously inserted and the lump is usually found to he a diamond. But—and now comes the climax—they get at the contents of his stomach hy the administration of powerful physics and emetics, for the kaffir will go to any extreme that he may steal the precious stones.

"There is a class of men in south Africa known as I. D. B.'s—illicit diamond-huyers—who make it their husiness to buy stolen diamonds from the negroes. It is a great risk they run. If a detectlve sees a man walking the streets of Kimberly, whom he merely suspects of having a diamond in his possession, he may cause his arrest. If a diamond is found on his person and he fails to give a satisfactory proof of his right to it, he is tried, and, if convicted, sentenced to five years' penal servitude and a fine of $5000.

"The Dutch were once the supreme rulers over south Africa, but they are rapidly giving way to the English. Even in the Dutch Reformed Church their language is heing replaced hy the English tongue."

Assessment Work while Mines are Idle.

TO THE EDITOR:—Io view of the present condition of the silver market, and its hearing on silver mining interests, will it not be well for all those haviog silver mining interests to meet and discuss measures for procuring relief as to the quantity of work to be done, or cost thereof for assessment work as now required by law, to legally hold mines, claims or locations? With all work stopped; with some expenses and no income, the enforced expenditure of $100 for assessment work on each claim, mlght well be modified until hetter times obtain. The hurden falls heavily on those least able to hear it.

I. B. BAINBRIDGE.

Pasadena, Cal., June 28, 1893.

A WATER SCHEME.—M. C. Taylor, a resident of Grass Valley, has forwarded a communication to the Board of Supervisors in which he suggests a new plan for San Francisco to supply herself with the water needed by her citizens. Hls idea is that the city should file a right to water at the forks of the middle and north Yuha rivers, a point about 140 miles distant. Water could he brought from that point, where an electric plant could also he established.

MacArthur-Forrest Process
UNITED STATES PATENTS CONTROLLED BY
The Gold and Silver Extraction, M. & M Co.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Among the mills that have adopted the process are: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; The San Juan Gold M. & M. Co., Silverton, Colo.; The Mercur Gold Mining Co., Fairfield, Utah; The Union Mills Co. Tuscarora, Elko Co., Nev.; The Creighton Mining & Milling Co., Creighton, Cherokee Co., Georgia; The Moratock Mine, Montgomery Co., N. C.

Experimental tests and carloads of ore treated on request.

Cheapest and surest process yet discovered for treating many kinds of refractory ores.

Full information and literature furnished by

T. L. WISWALL,

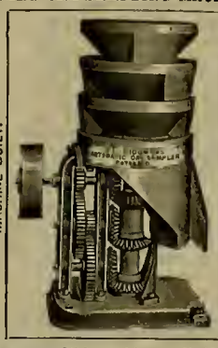
H. L. BRIDGMAN,
PATENT ORE SAMPLING MACHINE,



AUTOMATIC IN ACTION. RELIABLE IN RESULTS. IT IS THE ONLY FIRST-CLASS ORE-SAMPLING MACHINE BUILT.

THIS MACHINE FURNISHES DUPLICATE SAMPLES, AND SAVES THE EXPENSE OF MIXING, CONEING AND QUARTERING.

Among users of this machine are Cia Metalurgica Mexicana, San Luis Potosi, Mexico; Chicago Copper Refining Co., Blue Island, Ill.; Hemenway & Brown, Antofagasta, Chile; Francisco M. Coughlan, Chloride, Mexico.
It should be used by Lead, Copper, Zinc and Iron Works, Concentrating and Leaching Works, Gold and Silver Mills, and Sampling Works. Investigate it. Send for Catalogue.

POWER MACHINERY.
SIMPLE, COMPOUND AND TRIPLE EXPANSION
CORLISS ENGINES
STEAM BOILERS.
CABLE AND ELECTRIC RAILWAYS.

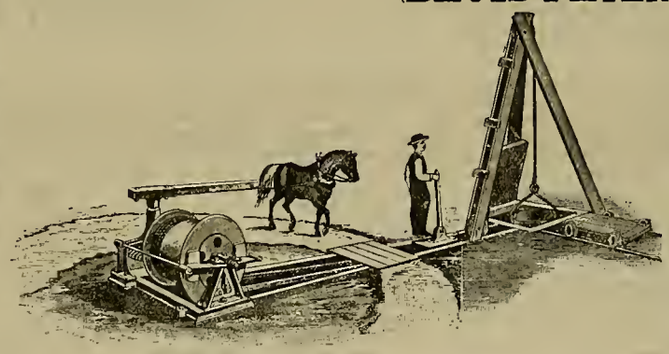
JOSHUA HENDY MACHINE WORKS.
NO. 51 FREMONT STREET, SAN FRANCISCO, CAL.
BUILDERS OF
"Sensible" Horse-Power Hoisting Whims.
(DAVIS PATENT.)

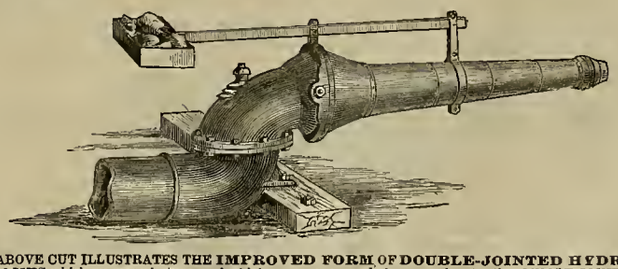


PRICES REDUCED.
The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.
The bevel gear on the drum shaft is loose, and, o'hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.
As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.
It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.
Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.
Circulars giving Capacities and Prices furnished on application.

GUARANTEED **WATER WHEELS** BUILT BY THE **JAMES LEFFEL & Co.**
WITH 30 YEARS EXPERIENCE.
UPRIGHT AND HORIZONTAL.
FOR **MINING, ELECTRIC and IRRIGATING PLANTS.**

Easy working gates, highest percentage of power and regular speed at all gateage. Equally adapted to high and low heads. 110 sizes and styles. Write us, give number of feet head and size of stream, state what kind of mill you have, and we will send fine pamphlet.
THE **JAMES LEFFEL & CO.,** SPRINGFIELD, OHIO, AND NEW YORK CITY.
GEN'L AGENCIES: FRASER & CHALMERS, CHICAGO, ILLS., AND PARKE & LACY, SAN FRANCISCO, CAL.

IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.
JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

DEWEY & CO. {220 MARKET ST., S. F. Elevator, 12 Front.} **PATENT AGENTS.**

The Explorers' and Assayers' Companion.
A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Mechanical Progress.

Speed in Steamship Travel.

Perhaps the most practical article on the possibilities of speed yet published is one contained in the current number of the *North American Review*. The writer is Prof. J. H. Biles, of Glasgow University, who, as the designer of the successful ocean greyhounds, New York and Paris, is well qualified to present a sound opinion in the matter. At any rate, he does so in no uncertain manner as regards the mechanical difficulties which lie in the way of the attainment of greater speed, and his conclusions are well worth consideration. Looking back on the progress which has marked transatlantic navigation during the last decade, we find that the best time of transit from New York to Liverpool has during that period been reduced from about eight days to a little over six days. The question naturally comes up: Will this ration of increase in speed be maintained in the next ten years, and if so by what means will its accomplishment be attained? Mr. Biles is broadly of the opinion that an equal advance in the speed of transatlantic vessels will be witnessed during the coming decade. That is, that the time of passage will by then be reduced to a little over four days, necessitating a speed of 30 knots an hour, and he shows in detail how the extra knots are to be obtained.

Briefly, his conclusions are as follows: To attain a maximum of speed, the cargo-carrying feature will have to be reduced or eliminated in the swift mail and passenger carriers, the space thus gained being devoted to additional motive power and the cargo relegated to slower vessels. This, he calculates, would give an additional 1½ knots an hour. The use of nickel steel in construction in place of ordinary steel is another feature which will add a further knot an hour. Up to the present, considerations of expense have prevented the use of this material, which is from 40 to 50 per cent stronger than the steel now used, but the cost of it will surely decrease as years go by, in the same manner as did that of its predecessor, and the ocean racers of the future will be made of nickel steel. The adoption of lighter boilers, of locomotive or other type, and the use of oil or other light fuel in place of coal, with improved methods of combustion and of utilizing heat, will also be details of improvement which may be expected in the evolution of the next ten years. Increase in structural dimensions, too, will tend to the same end, length and draft of water being valuable additions which can be made with a view of increasing speed, it having been proved that by increasing the length of some forms of vessels more velocity may be got out of them with the same amount of motive power. In fine, our authority concludes that a vessel 1000 feet long, 100 feet wide, with a draft of water of 30 feet, with a structure built of stronger steel than at present adopted, with lightened boilers, with oil or other light fuel, and with the steady general improvements in methods of construction and management of ships and machinery, will be capable of crossing the Atlantic at a speed of 30 knots an hour, thus accomplishing the passage in a little over four days. In the designing of such a vessel, although many problems of constructural detail will be involved, there is no insuperable difficulty. In the commercial aspect of such a departure it will, however, be more or less of an experiment at first.

Gas Motors in Germany.

In a recent address before the Prussian Association for the Promotion of Industry, Herr W. Oechelhauser stated that the distribution of power, or rather of fuel, from gas works, has not made as much progress as it should have done. The practice goes as far back as 25 years ago. There seems to have been, two years ago, about 18,000 gas motors in Germany, with an aggregate horse power of about 60,000. To these are to be added the turnout during the last two years, amounting for the two greatest manufactories alone to 1950 motors, of 8830 horse power. At the beginning of 1892 there were in Prussia alone 69,087 steam horse power occupied in driving dynamos. It must, at the time, be remembered that it is only recently that gas has been cheap enough to enable gas motors to be pushed. The state of the gas motor industry is a thing for Germany to be proud of. The Lenoir machine of 1861 used 123 5 cubic feet per horse power per hour; the present motors use 28, or in large sizes 23 75; so that a 16-candle incandescent lamp can now be kept going at an expense of 21.2 cubic feet of gas. And this consumption is not the consumption at full load, as it is usually reckoned for steam engines and electromotors, but the average consumption for all loads; and it may be expected to be reduced very soon, with motors of 500 horse power, to 17.6 cubic feet of 16-candle gas per horse power per hour.

Phillips' Aerial Machine.

The London *Times* gives the following description of the new aerial machine of Horatio Phillips, with which some successful experiments have been made recently near Harrow. The machine is on an entirely new principle, being sustained in its flight by means of induced currents acting upon slats or laths of wood arranged similarly to those of a Venetian blind, instead of the unwieldy plane to which designers of flying machines have usually had recourse. Not but what Mr. Phillips has used inclined planes, but he has reduced their dimensions, step by step, until the transverse sectional area of one of his present sustainers measures only an inch and a half in breadth by an eighth of an inch in thickness at the front, tapering to nothing at the back. Broadly stated, the cross-section of the slat is that of a knife blade, with a thick edge at back and a thin one at front, and with the upper and under side of the slat curved, but both differently. The form, in fact, is such that when the machine is in motion the convex upper surface near the front or thick edge deflects the air upwards, thus creating a partial vacuum on the upper surface of the slat.

The under or concave surface of the slat is formed to a parabolic curve, which gradually puts the particles of air into motion downwards, thus producing an excess of pressure on the under side of the slat. It thus follows that upon a forward motion being given to the machine, the horizontal air-pressure which is brought upon the slats becomes converted, by reason of the form of the slats, into an upward vertical pressure which acts as a lifting power and raises the machine into the air. There are 50 of these sustainers or slats, each 1½ inches wide and 22 feet long. They are fitted 2 inches apart and with their edges horizontal, in a frame 22 feet wide and 9 feet 6 inches high. They have a combined area of lifting surface of 136 square feet, and they are carried in their frame upon a carriage resembling a canoe, 25 feet long and 1 foot 6 inches wide at the rear, but tapering to a point at the front.

Upon the carriage and near the sustainers are placed the engine and boiler and the air-propeller. The engine is compound, having cylinders 1¾ inches and 3⅝ inches in diameter, respectively, with a 6 inch stroke, and fitted with ordinary slide valves. The boiler is a cylindrical vessel of phosphor bronze, 12 inches in diameter and 16 inches long. The propeller is two-bladed, 6 feet in diameter and of 8 feet pitch, and is driven at the rate of about 400 revolutions per minute. The total weight of the machine in working order is 330 pounds.

INSULATING WIRE BY PAPER.—While electricians have been searching high and low for a perfect insulating medium, especially for high-tension currents, an everyday material has been utilized for this purpose in a very practical and effective manner. For a long time the value of insulation composed of spirally-wound and overlapping strings of pure vegetable-fiber paper has been recognized, and many patents have been taken out, having in view its more efficient application, but only recently has the paper-insulating industry attained dimensions which entitle it to a prominent place in the electrical field. The paper, which is specially made, is thoroughly cured before being used. The rolls are mounted on machines and are cut into strips by circular shears, which leave the paper resembling "ticker tape." The spools of paper are then placed on mandrels in the covering machines, and as the wire feeds through the paper is laid on in overlapping spirals at the rate of from 60 to 500 revolutions of the mechanism per minute. The wire is then passed through dies, which materially increase the tightness and compactness of the insulation. The next step is the winding of the wire on iron reels, which are placed in drying ovens that have a temperature of 250° Fahrenheit. This expels all moisture, and the wire is suddenly plunged in a special secret compound, and for some time subjected to a stewing process at a temperature of about 275°. The wires in due course go from the tanks to the braiding or leading department, where they are finished. Although paper-insulated wire is used largely in telephone work, it has been found very effective and reliable with high potential currents, even up to 10,000 volts.

Scientific Progress.

The Relation of Photography to Art.

M. Robert de la Sizeranon has an excellent article on the subject, "Relation of Photography to Art" in the *Revue des Deux Mondes*, translated into *The Review of Reviews*. He dwells, first, on the service photography has rendered to painters in enabling them to study correctness of detail. The conventional landscapes, the complicated architectural backgrounds, the "ideal" and impossible forms of men and horses, have all disappeared. The whole art of "historic landscape" has been relegated to the Valley of Lost Lumber. In perspective, photography has made it possible for us to appreciate more accurately the size of figures in different planes. Most painters before the rise of photography will be found to have given too much importance to the figures of their background or middle distances, relatively to those of the foreground—a mistake frequently made by amateurs in landscapes. Photography has also simplified, to an astonishing degree, the production of panoramas. After noting the influence of photographs of distant countries in interfering with the production of fancy tropical landscapes and imaginary eastern scenes, and the revolution it has brought about in the art of portraiture, M. de la Sizeranon goes on to discuss what may be expected of photography in the future. He devotes several pages to the discussion of Muybridge's instantaneous photographs of horses and other animals in rapid motion, and inquires whether we are to accept the often extremely ugly and awkward poses shown in them as nearer reality than what the ordinary eye supposes itself to see. He thinks not—rather that the modern picture is a violent exaggeration; for it presents to us, immovably fixed, a position in which the animal only remained for so incalculably minute a fraction of a second that to the eye it blended with the position immediately following it, and so formed part of a harmonious motion. Every movement consists of a succession of poses, each lasting so infinitesimally short a time that we see none of them separately. What we do see (when the motion is not too quick to let us see anything distinctly) is a generalized representation of the whole, a kind of composite photograph, so to speak; and an approximate picture of this is nearer the truth than any number of instantaneous photographs of separate poses. It is, however, a distinct gain that the classic charger at full gallop, with all four legs extended in the air at once, who never existed on earth save in battle pictures, should finally have been hunted and driven from the field, as Mr. Muybridge has had some share in doing.

Photography is growing more perfect every day; even the great color problem seems to be as good as solved at last. M. Lippman has succeeded in producing several very successful photographs in colors, by availing himself of the laws of interference of light. Last spring, at the International Exhibition of Photography at Paris, he exhibited a picture of an Ara Parrot (blue and yellow), and a branch of holly; at a later date he succeeded in producing a stained-glass window in four colors, a group of flags, a plate of oranges with a red poppy, thus almost completing the chromatic scale. He uses a mirror, a film of gelatino-bromure, and a little mercury.

It may be said that, since this last step has been taken, photography leaves nothing for the painter to do. If it were true that the only object of art is the mathematically accurate reproduction of the world around us, this argument would be unanswerable, and the "realist" school, who maintain this position, are beginning to find that they have no *raison d'etre* whatever. There remains, then, nothing for artists to do but turn their attention to those (of late somewhat neglected) regions which the camera cannot reach; and we may consequently expect a new development of imagination and idealistic art.

How Straw Paper Is Made.

A recent visit of a newspaper man to the straw-paper mill at Chillicothe, Ill., results in the following description of how the paper is made, and as the method is very similar to that of making strawboard, the article will be interesting.

Through the courtesy of Mr. James Waterhouse, we started at the straw pile and were conducted through the various processes to where the finished paper lay bundled for the market. The straw is conveyed on a long carrier from the straw pile to the cutter, which is run by a 25-horse power engine, and cut into small particles, then elevated to the upper story and dropped into two digesters, where it is cooked by the lime process.

These digesters are large iron tubs 24 feet long, 8 feet in diameter, and weigh 80 tons; it requires a carload of lime every week. The hot liquor cooks the straw to a pulp, after which it passes through pipes to a chest on the lower floor and is then pumped through an eight-inch pipe to the washing engine on the upper floor, then back down below to the half-finishing chest, whence it is again pumped up to the upper floor and passes through the coase grinder and finishing engine, thence to the vat near the rollers, where the liquid is separated from the stock, which is gathered by a fine wire roller and adheres to the felt rollers, where it begins to assume shape. It then passes over a series of rollers at the rate of 96 to 120 feet per minute. It is then carried over 13 large drying rollers that are heated by steam, thence to two stacks of calenders of chilled steel, where the paper is finished and transferred to the reel stand and then passed to the cutter, where it is cut to any required size. It is then received by two boys, who carry it to the table where it is bundled, and the straw pile that you stood by six hours ago lies before you, finished goods all ready for the market.

The paper is manufactured by the Tompkins process. The mill is supplied with the latest improved machinery for making brown straw and colored express paper.

Some idea may be formed of the magnitude of this plant when you realize that the ponderous machinery for its operation weighs 1000 tons, and requires three engines of 140-horse power to operate it, and three immense boilers to generate the steam, and still the power is insufficient. The company will place another engine of 100-horse power in the near future. The steam pump in the valley below the mill raises 500 gallons of water per minute.—Sbears.

WARM AND COLD GLASSES.—This matter of conductivity brings up that of the feeling of coolness to the touch, of different substances which are at a temperature below the temperature of the human body. Most of our readers will be aware that a glass spectacle lens feels colder to the touch than does one of horn or celluloid at precisely the same temperature. This is, of course, due to the greater conductivity of the glass. It does not necessarily indicate any advantage in respect of the absorption of radiant heat. Thus, to give a somewhat extreme illustration: It is well known that ice, which is a better conductor than is glass, can be successfully employed for the construction of lenses to concentrate radiant heat. Indeed, one of our observations shows that bad conductivity is to be desired in any screen intended to filter heat rays from the eyes. The conductivity of horn being .0001 in C. G. S. units, that of glass is about .0005. The conductivity of quartz, perpendicular to the axis, is, according to Prof. Forbes, as high as .0042, which may, perhaps, account for the "marvellous cooling properties" of certain lenses. On the other hand, in the direction of the axis, the conductivity of quartz is stated to be only .001. Is it possible to discriminate between pebble lenses cut in the two directions by the sense of touch alone?—Optician.

STONE UNDER THE MICROSCOPE.—It is often held that the best method of determining the probable durability of a building stone is to study its surface, or thin, transparent slices, under a microscope. This method of study in recent years has been most fruitful in developing interesting and valuable knowledge of a scientific and truly practical character. An examination of a section by means of the microscope will show not merely the various substances which compose it, but also the method according to which they are arranged, and by which they are attached to one another. For example, pyrites is considered to be the enemy of the quarryman and constructor, since it decomposes with ease and stains and discolors the rock. Pyrites in sharp, well-defined crystals sometimes decomposes with great difficulty. If a crystal or grain of pyrites is embedded in soft, porous, light-colored sandstones, its presence will certainly soon demonstrate itself by the black spot which will form about it in the porous stone, and will permanently disfigure and mar its beauty. If the same grain of pyrites is situated in or near very hard, compact, non-absorbent stone, the constituent minerals of which are not rifted or cracked, this grain of pyrites may decompose and the products be washed away, leaving the stone untarnished.—Stone.

Professional.

A. T. DEWEY. W. B. EWER. G. H. STRONG.
DEWEY & CO.'S
Scientific Press Patent Agency.
ESTABLISHED 1863.
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco
GOLD AND SILVER REFINERY
And Assay Office.
Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.
—MANUFACTURERS OF—
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges.
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco
We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.C.² BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Dennistun's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting, Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.
Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I. and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Electricity.

The Trolley on the Erie Canal.

Within the next few weeks some experiments will be made hy Mr. Hannan, State Superintendent of Public Works, with the view of testing the feasihility of operating the Erie canal hy electricity, in accordance with the recommendation of Governor Flower. The trolley system is to be tried, and $10,000 are availahle for the experiment. According to investigations made, $1,000,000 would equip the canal and provide for 12 power-houses 30 miles apart. There is abundant water-power along the route for generating electricity. The total expense to each boatman for a dynamo would be from $150 to $200.

It is claimed by Governor Flower that it now costs the boatmen on an average $2 per day for horse-power, while it is estimated that the trolley system of towage would only cost 60 cents per day, aud that this would make so much difference that at two cents per bushel for grain carried the boatmen could make money. The present charge is 4¾ to 5 cents per hushel. The maintenance of the towing-path now costs about $400,000 per annum, and this sum wonld be saved if the trolley were adopted.

The members of the Union for the Improvement of Canals are not enthusiastic over Governor Flower's plan. They say it will cost much more than $1,000,000 to equip the canal, and that the figured cost of 60 cents per day to the hoatmen is much too low. Others say that the true solution of the problem is to deepen the canal to nine feet and then use a steam towage system, with an increased speed per hour of from five to six miles. The trolley presupposes a screw propeller on the boat operated by transmitted power, and many believe that the present section of the canal does not furnish water enough for this use of the screw. The overhead cable system is more favored by some, as providing a dead pull, without the slip and waste of power incident to screw propulsion.

Mr. Horatio Seymour, ex-State Engineer, says that the true solution of better canal service is to deepen the canal to nine feet at least, for no vessel can he propelled with economy in a shallow channel. He believes that this depth could he secured for about $1,000,000 over the whole canal, and that the carrying capacity of eacb boat would be increased by 50 tons by one foot more of draft thus secured.—Engineering News.

Failure of Motors in Shops.

Prof. Forbes, at the Electrical Convention neld in St. Louis lately, said:

You can hardly go into the workshops of any manufacturer of any country, where there is originality of design, where the man at the head is a great thinker as well as a good mechanician—you can hardly enter the shops without seeing some motor work upon an alternating cnrrent of a single phase. I bave seen at least a dozen classes of such motors, all working fairly well, but there are none of them heing put, at the present time, largely on the market. I am speaking now of motors which will start from rest with a good powerful twist, and which will keep up their speed and work economically. Of that type of motors I say I have seen a dozen different kinds in different workshops, bnt none of them largely used. I regret that I cannot make invidious comparisons between different systems just at the present moment.

In reply, President Ayer said:

Prof. Forbes has given us his observations to the effect that many shops have in operation various types of motors of small horse-power operating fairly well, doing some work and indicative of great promise, and when the heads of the concern are consulted and attention is called to these motors they do not like to admit that they are failures. Certainly the evidence is that manufacturers and representative men have concluded that there is little to he gained from them. Tbis is a disappointment to many of us. We have been anxiously awaiting this motor, and it is hard to give it up; but witb the experience of the past, and in view of the opinions we have heard expressed here, I do not think that any of us will lay plans for utilizing motors of this character in the near future. In speaking of the application or the prohability of the early development of a motor for use on our present lines, I referred to the apparatus we have in service—the high-frequency apparatus which is used in this country, 16,000 alternations per minute.

CONDUIT SYSTEM.—A new conduit system of electric traction, was recently tested on a short experimental track at Coney Island with very good success, it is stated. As near as can he determined from tbe newspaper reports the system consists of a conduit provided with so-called contact hoxes at short intervals. In the contact hoxes the cahle is bare, hut elsewhere it is covered witb lead pipe insulation. Up to the hottom of tbe cahle the contact hox is filled with solid paraffine, and tbe remainder of the hox is filled with high-grade paraffine oil. At tbe top of the box projects an arm fastened to a rod, at the lower end of which is a copper hrush for making a contact with the cable pieces. The position of the contact arm is so controlled hy a stout spring that when no car is passing the brush is in its normal position and no current is passing either to the ground or the rail, or in any way involving leakage or endangering life. The peculiarity of the arm is that it is constructed on the plan of the telescope, so that a car may hack and get tbe current without any strain heing brought on the box or the cable. The shoe by which the current is taken into the car, instead of being a short device, similar to the cahle grip, is made nearly the length of the car, being 9 ft. 2 in. long. It is constructed flexihly, in such a manner as to enable the car to take any curve, however sharp, and still preserve absolnte contact with the hoxes.—Engineering News.

A Remarkable Railway.

If the scheme elaborated by an Italian engineer for the construction of an elevated railway in Naples is carried into execution, Italy will possess one of tbe most remarkable structures in the world. As far as length is concerned, the projected line is not of great importance, but the boldness of the idea and its originality are very striking. Let the imagination conceive the hilly portion of a town connected by means of viaducts and towers with that part lying at a low level, and tbe suhstance of Mr. A. Avena's project will then be readily understood. The handsome and populous part of Naples, radiating from Via Roma, bas only communication with the Corso Vittorio Emmanuele, the San Martino hill and the (at a still higher level) new Rione del Vomero by means of narrow, tortnous streets, many of them being impracticable for carriage traffic. It is hetween these two extreme localities that the proposed electric railway is to form a connection. The line is to be carried on two metallic viaducts, each divided so as to form a douhle way, one for the operation of electric cars and the other for pedestrians. A masonry tower, 325 feet high, is to he built in the Via Roma, and from this the first viaduct, 1180 feet long, will he carried to the Corso Vittorio Emmanuele, where it will terminate in the base of a metallic tower, 490 feet in height. The second viaduct, 950 feet long and branching out of this tower some distance helow the summit, will pass over the San Martino hill and end in the ground level at the new Rione del Vomero. The viaducts will he carried on pyramidical metallic towers having masonry foundations, and the masonry tower at the heginning of the first viaduct and the metallic tower connecting the two viaducts will eacb be provided with staircases and capacious lifts for conveying passengers up and down. Passengers entering the cars at either end of tbe line will not be compelled to change their seats on arriving at the metallic tower, as the cars will be automatically placed on the lifts for ascending to or descending from the highest viaduct, when the cars will continue their way to either terminns. Generating stations will be provided at each terminus for producing current for lighting and power purposes. The undertaking, a concession for which has been granted, would provide a splendid view of the wbole of Naples.—Electrical Review.

Electric Traction.

The development of electric traction is now proceeding at a greater rate than ever before, and is still gaining in acceleration. "Networks" are being everywhere and almost daily projected, the greatest development in this respect heing in northern Obio, eastern Pennsylvania and northern New Jersey, where, if all the schemes that bave advanced as far as incorporation are carried out, the agricultural population in the network area will have almost urban transportation facilities. Of long-distance lines, the great Chicago & St. Louis line, seems to assure the final success of this remarkable enterprise. In Pennsylvania and Ohio there are several lines of over a hundred miles in length tbat are expected soon to he started, and each week tbe projects appear to become bolder.

As to street railways, it has been impossible for the large companies, even with their facilities increased to the utmost, to anywhere nearly equal the enormous demand for the necessary electric apparatus, and their orders are now stated to he months hehind and daily hecoming more in arrears. As to the final extent to which electric traction will he adopted for long distances, it is interesting to note that in the history of steam roads the first lines were sbort, and that it was tbrough the gradual connection of these that various lengthy systems were built up. As a consequence, the less ambitious lines of to-day may prove to he links in future great systems that will he gradually and therefore profitahly developed, and wbich are indirectly heing fostered hy the development of the smaller inter-urban lines.—Electric World.

Useful Information.

Petroleum Fuel in the Marine Service.

An interesting report on the use of petroleum refuse in the Italian navy has heen made by Admiral Sambuy of the Italian navy, an officer who has had charge of all the latest experiments with the petroleum fuel.

The experiments have been most exhaustive and satisfactory. The Admiral is firmly convinced of the great advantages of employing such a combustible as an auxiliary fuel in ships and a sole fuel in torpedo boats. He is particularly enthusiastic concerning it for the torpedo boats on account of the many conveniences concerning its use, and notably for the following reasons: Great heating power, ease of management, preservation of tubes and boilers, suppression of smoke, convenience of stowage, increased speed, increased radius of action, decrease of engineer's force, ease of removing combustible supply, both at sea and in port, perfect command of steam pressure, better stability with fuel stowed in the hottom of boat, and absence of dust and dirt in tubes and boilers.

The unsatisfactory results arising from the danger of ignition described by the French experiments are explained by the fact that the French employed the method of a certain Genoese named Ferrari, and with this method refined petroleum was employed. In Italy, with Cunibetri's system of using petroleum refuse, there is no danger of ignition at any temperature below 300° Centigrade, as trials have shown that it could not he set fire to by exploding shells. The Admiral is of the opinion that if the practical experience of employing torpedo boats fitted for petroleum with the permanent squadron proves to be a success, all their new boats should be designed for tbe sole use of this fuel, and should be fitted to carry it in bottom tanks below the water line, when there would be less danger from shot and bullet holes.

Some interesting trials of this combustible may be expected this summer, as Engineer Cunihetri, who is at present at Naples fitting his apparatus to the Confiensa and Montehello, has been ordered as chief engineer on the staff of the Duke of Genoa, who takes command of the permanent squadron on the Lepanto, a vessel already fitted for a petroleum refuse hurning and supply ship. There will be attached to the squadron three torpedo hoats, fitted for using the petroleum refuse. The present Minister of Marine takes an interest in the matter, and is disposed to extend its nse.

American Tools.

The manufacture of tools in the United States bids fair to surpass that of all other countries, including even England. The American implement is ligbter, bandier, and is usually made of hetter material than has been hitherto employed in Europe. The Americans have excellent iron and unequalled wood. (Hickory hammer handles!) The American tool manufacturers appear to have entirely abandoned European traditions, and to bave struck out an entirely new path for themselves; hammers, augers, files, sharpening and cutting tools, axes, saws, spades, screws, nails, etc., even the handles of implements, appear to have received quite new forms. In the same way tbe genius of the American, extremely careful to save all unnecessary lahor, uses cast iron far more tban it is employed in Europe. A great many machines and parts of tools that we make of wrought iron are there ohtained in excellent quality by casting. This has the important advantage that if a part of a machine is hroken or worn another exactly similar can be procured by sending to the factory its catalogue numher.

The American always endeavors, as far as possihle, to economize lahor. The blacksmith gets along without the man whom we consider absolutely necessary to hold the horse's leg. There is contained in every American an inventor, a mechanic or an architect. It is marvellous with what simple means they can succeed. As an example of the practical common sense of the Americans, we may instance the following: The masnn, who with us considers the cutting hammer an indispensahle implement, does not regard it a separate tool in America; there the trowel is made of hardened steel, and so shaped that it is used to cut and hreak bricks in brick-laying. When one thinks of the time tbat is lost in changing tools during the construction of a small house, he can see that this makes an important economy. The woodman, for another example, uses the axe far more than the saw, notwithstanding the danger whicb it involves. The Americans are as extravagant with materials as they are economical with labor, and for this reason the repairing of tools and implements plays a less imnortant role than with us.—Frankfurter Zeitung.

The Ancient and the Modern Gun.

An engineer, after visiting the caravel "Santa Maria," remarked that tbe little guns of that vessel were silent witnesses as to the limited advance in the science of ordnance, but bore potent testimony of the advance in the mechanic art. "Here," said the engineer, "is a huilt-up, breech-loading gun; it has a central tuhe, on which jackets are shrunk (or forced) in short sections; at the joints hetween these sections there are other iron bands, tightly shrunk. The hreech block, which is chambered, contains the cartridge; it is held in place hy a key, or wedge. This gun is certified to he a *jac simile* of those actually used by Columbus on board the 'Santa Maria.'

"The difference hetween this gun and those now heing built, and about wbich we read such interesting accounts, differs in magnitude, not in principle. The molecular strain in a forging or casting of great size led to the abandonment of cast guns and the adoption of huilt-up guns in our own generation; it seems evident that as the cupolas advanced in size and the molders' art progressed, the cast guns of large size became practicable; but with the increased internal pressures demanded the castings reached their limit, and built-up guns became essential.

"The gun of to-day is composed of a central tuhe, on which are shrunk 'hoops' in shorter sections; its hreech hlock is held in place by a slotted screw, which is but another form of the wedge, being a circular inclined plane.

"Tbe difference between the guns of Columbus' ships and those of to-day is due almost exclusively to the mechanic arts; to the steam engine as the power; furnaces, the cupolas, the hammers and the lathes as the tools, and to tbe brawny sons of toil who work these machines; the advance has been gradual, and is wrought by mechanics and draftsmen, and the claim that gunnery or that ordnance helongs to the occult science pales before the scrutiny of common-sense observation."

What Is a Corliss Engine?

One not versed in matters pertaining to the steam engine, and ignorant of just what constitutes a Corliss engine, might have considerable difficulty in these days to determine just what a Corliss engine is or was. The distinctive features of this engine, as built by its originator, were in the form of bed; in having two steam valves at either end of the cylinder on top, and two exhaust valves at either end below, in its round or cylindrical valves, with their oscillating motion; in its wrist-plate motion for actuating these valves, and finally in the detaching device for enabling the governor to control tbe point of cut-off. Our ignornant visitor to tbe exhihition at Chicago who should go ahout the power plant tbere, might conclude, not only that any one of these features might he dispensed with, and the engine still be a Corliss, hut that nearly all of them could be discarded, and still the name would apply. There are Corliss engines there that bave not the Corliss form of bedplate; and still others that have no wrist-plate motion. Usage seems almost to have justified the application of the name Corliss to any engine which bas four valves and an automatic variable cut-off.

The circumstance is certainly a great trihute to the genius of George H. Corliss—a trihute which no one interested in him or his fame can in the least object to; but it is questionable if there is the commercial advantage in it for some of those who pay the tribute that they think there is. Chas. H. Brown's engine is certainly as mucb a Corliss as some of those "hyphenated Corliss"

engines which, however excellent they may he as engines, resemhle the Corliss scarcely at all. It is extremely doubtful if he would have sold more engines lf he had called his engine the Brown-Corliss.

Where an engine has some of the features now considered essential to good practice, and is large enough to make the contract for building it amount to something, its selection depends usually upon the judgment of a man who knows what there is about it that is the invention of Corliss, and what is not. And he also knows what features are superior or inferior to the Corliss, and his choice will not he much, if any, affected hy the name which the machine may hear.

There is not offered as a criticism of those who choose to apply the name Corliss to their engines, for we helieve it ls perfectly right for them to use the name if they think the engine emhodies Corliss features, and should properly be classed as Corliss. We are only calling attention to what is growing to he a somewhat curions feature of the engine husiness.

Ethically it is certainly much superior to the course of those who, adopting the features originaed hy others, carefully avoid giving any credit for them whatever, either in the naming of the machine, or in any other way.—American Machinist.

IN the exact center of the Mines and Mining huilding at the World's Fair is a tall needle of anthracite coal from the mammoth vein of Pennsylvania. It is part of the State exhibit. Fifty-four feet high it stands and in the mass are 95 tons. The foundation goes through the floor. The mass is 10 feet sqnare. The cap was put on and the needle completed last week. It cost $10,000 to get up the pyramid. The hottom layer is from the hottom of the coal vein, the second layer is from the second layer in the coal vein, and so on to the top. There are six carloads of it in all.

To the World's Fair!

Belmont School.

BELMONT SCHOOL, most delightfully and advantageously located 25 miles south of San Francisco, prepares for any college or school of science. The consolidation of the Hopkins Academy with it brings $50,000 to the $100,000 already invested, and so greatly adds to the resources of a school already well equipped as to place its permanence and its ability to offer the best and the broadest instruction beyond question. Twenty scholarships invite earnest and able young men of slender means. A gymnasium and athletic grounds, unsurpassed by those of any secondary school in the entire country, under the direction of the present physical instructor in Williams College, insure unexcelled physical training. The school invites inspection. References required. For catalogue address, W. T. Reid, A. M. (Harvard), Head Master Belmont, California.

CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantagee of these belts over *any others* will be readily seen by practical millmen.

First, the flangee or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and orming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager. 419 California St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE —

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
SOUTH MILWAUKEE, WIS. U. S. A.

THOMPSON BROTHERS,
EUREKA FOUNDRY
— Manufacturers of —
CASTINGS OF EVERY DESCRIPTION.
127, 129 and 121 Beale Street,
Between Mission and Howard, SAN FRANCISCO.
GAS WORK A SPECIALTY.

TUBBS CORDAGE CO.
(A Corporation.)

Constantly on hand a full assortment of Manila Rope sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.
611 & 613 Front St., San Francisco, Cal.

FRANCIS SMITH & CO.,
MANUFACTURER OF
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes
NO. 130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Butte.

THE GOLDEN QUEEN.—Oroville *Mercury*, June 29: C. J. Nickerson, one of the owners of the Golden Queen quartz mine at Forbestown, arrived in Oroville last night, accompanied by Geo. C. Hunter, the former superintendent. The gentlemen proceed to Forbestown this morning and will at once begin preparing the mill and mine to commence operations about July 15th. This mine, owing to difficulties among the owners, has laid idle for the past two years, although at the time it was closed down it was paying handsomely. They have one of the best ten-stamp mills in the county, which has been kept in good repair and it will require but little work to prepare it for operations. Geo. C. Hunter will, as before, be superintendent, and Arthur Peterson will have charge of the mill. There are now at the depot several carloads of material awaiting shipment to the mine. When the Golden Queen shall have resumed and the Shakespeare has its 30-stamp mill going, which will be about the same time, Forbestown will have three mills with 80 stamps crushing ore day and night, besides the biggest reduction works in northern California.

A VALY RICH MINE.—Oroville *Mercury*, July 3: Thomas R Jones, the well-known mining man of Gravel Range, was in town to-day, and paid the *Mercury* a visit. He is a partner in the famous gravel mine, owned by Jones Brothers and Reece, and he brought down with him the result of a recent clean-up. We are pleased to state that the mine above referred to is proving to be one of the richest ever discovered in the county. The company has now a force of eight men at work, and last week's clean-up showed net results of about $30 per day to the man. A drift has been run in under the lava about 300 feet and the channel is from thirty to forty feet wide, nearly all of which is pay gravel. The gravel is brought to the mouth of the drift in cars and washed. The cars are four feet long, twenty inches wide and eighteen inches deep, and the dirt averages $6 50 to the car. The gravel is apparently inexhaustible and prospects are good for a continuance of the pay streak. The proprietors of this mine are to be congratulated upon their bonanza. There are other mines in the vicinity which give excellent prospects of proving as rich as the one worked by Jones Brothers and Reece.

Calaveras.

MORE GOOD MINES.—*Mt. Echo*, July 1: It is reported that several mines have been bonded in this section recently, and that a large number of men will be put to work in the near future. The idea seems to have got abroad that there are no good mines in this district save those that are now being worked. This is a great mistake. There are just as rich mines in this vicinity, no doubt, that are idle as those that are in operation. All that is required is capital to develop them.

HOISTING WORKS BURNED.—Cor. Calaveras *Chronicle*, June 30: The hoisting works of the Scorpion mine were entirely destroyed by fire last week. The cause is unknown. No one was in or at the mine at the time, but the people of this city knew something was up when the magazine exploded. The explosion was so great that parts of the machinery were pitched up on top of the hill. Supt. Dennison reports that he will commence work immediately to erect new works.

El Dorado.

ACTIVE AT EL DORADO.—Cor. *Republican*, June 29: Mining interests are very active. The Starlight mine, which has been idle for several years, has been cleaned out and a new company has been organized to work it with new machinery. The Oro Finn, situated south of here, is being steadily and successfully worked. A complete chlorination plant is being built, for which bricks are being made on the ground. They are now employing about 40 men, and will soon have a much larger force. A new company contemplates operating a mine near the old Crystal mine. As a matter of fact, a mining boom has struck us and every one is happy in anticipation of good times and plenty of employment in the future.

SPANISH DRY DIGGINGS.—Georgetown *Gazette*, June 29: The ten-stamp mill on Mr. Hadley's mine is running in full blast and the plates are looming up in fine style; the latest is that they will soon put up ten more stamps.

Nevada.

THREE MINES TO BE STARTED UP.—Nevada *Transcript*, June 30: We understand that five or six men will be here from San Francisco during the coming month for the purpose of finding an investment in some of our mines. It is said that two of them will come here particularly to examine a mine in this district that has not been worked for 10 or 15 years. We also learn that the new owners of the Sneath & Clay mine will be here during the coming month to start up that celebrated mine. It is understood that the Sharp & Nivens quartz mine will be started up during the coming month. When a good start is made upon these three mines there will be not less than 150 more men given employment. These properties are going into the hands of men of very large means and they will be worked upon a very large scale. There are already more men employed here than there have been for years, and the prospect is fine of there being a large increase very soon. The pay-days are near at hand again and the money market will receive a fresh impetus.

THE CENTRAL NORTH STAR. — Grass Valley *Union*, June 30: Superintendent Bennallack informs the *Union* reporter that the operations at the Central North Star mine will soon be in full blast. The new machinery is all in place, and in a day or so the pumping of the mine will be commenced. The shaft is down 230 feet, and in the bottom there is a ledge varying in size from 12 to 18 inches, which prospects well. The force of employes will be increased in a short time. The Central North Star is destined to become a good mine under Superintendent Bennallack's management.

DIVIDEND DECLARED.—Another dividend has been declared by the Omaha Mining Company, the amount being 15 cents per share. This far 15 dividends have been declared and indications are favorable for many more.

Siskiyou.

TO THE EDITOR:—I visited some of the mines in Quartz Valley and the Salmon River country last week and found them even better than they were reported to me to be. The formation in which the most of the mines in Quartz Valley are located is of a pockety character, consequently the ledges are pockety also. The old Shores mine, at present owned by Mr. Myers, is this principal one of the group. This mine was worked some 20 years ago and produced something over $80,000 for its owners. Then it lay abandoned for some time, until it was relocated by Mr. Erno, who sold it to Mr. Myers a short time ago. It is a true pocket ledge, the pay rock only occurring in short or disconnected pay chutes and pockets. In one of the old tunnels that was driven years ago to tap the ledge may be seen quartz that has formed on the porphyry on the sides of the tunnel since it was driven over 20 years ago. Last season, when I visited this mine, I collected some of this quartz which has been formed by the seepage of water through the porphyry overhead into the tunnel, and assayed it, and found that it showed a strong trace of gold. I collected, also, several minute bunches of crystals which formed on the points where the water was dripping from, and took out a couple of blocks containing pick marks which were covered by an incrustation of quartz a quarter of an inch thick that was formed since those pick marks were made. There are several small ledges being worked more or less in the same vicinity. The Eastleck Bros. expect to make a $20,000 cleanup from their hydraulic mine near Oro Fino this season, and the other gravel mines in that locality look favorable for good yields also. There is no drifting being done in the Campbell mine this season, but they are making good use of the water while it lasts for piping in the surface gravel on the south end of the property. The new wagon road from Etna to Sawyer's Bar will be opened by the 4th, when teams can go through to Sawyer's Bar without any inconvenience. The Salmon River country, of which Sawyer's Bar is the main distributing point, has better prospects this season than ever before. That section is attracting more attention from capitalists and prospectors now than any portion of northern California. I visited the Finley, Shaw and Johnson discovery on Jackass creek, which I made mention of in one of my former letters, and found it as rich as reported. Where they have taken out the money so far is from blanket seams of quartz and a curious combination of minerals resembling tellurium, which appear to be feeders of some larger deposit in the ledge of quartz-porphyry above. This quartz-porphyry ledge is about 40 feet wide and can be traced for nearly three-quarters of a mile over the mountain until it reaches the hard iron slate on the head of Specimen creek. This immense ledge or lode prospects well on the surface for low-grade ore, and, should the gold increase when the lode is sunk upon it, will become one of the largest low-grade milling propositions on the coast. So far no definite opinion can be formed of what it will turn out to be, as there has been but little prospecting work done on it. On the opposite side of the creek from this lode is the old Morning Star mine, now owned and being reopened by Captain Clarke, of the Gladstone, in Shasta county. The ledge will average nearly three feet in thickness and has been opened up some 400 feet. It was poorly worked years ago, as the prospect which the waste dump and the tailings from the mill gives plainly prove. The ledge, which is a north and south one, looks and prospects well. John Daggett, the newly-appointed superintendent of the Mint, visited his mines here this week. Mr. Ball, superintendent of the Gold Ball mine, is at his mine attending to some new development work he is having done.

There are only a few white men employed at the Dagget and Gold Ball mines; the rest are Chinamen. Those and the Schroeder mine on the head of Deadwood creek are the only quartz mines that I know of in this county where Chinese miners are employed in preference to white men. The Red Hill gravel mine, situated near the forks of the Salmon and owned by Alex Parker & Sons, is being worked now on an extensive scale and pays a handsome dividend to its owners. The Liberty, which is the extension of the Gold Ball mine, promises to become a good paying property. It is owned by Mr. Joseph Stephens, a merchant of Etna. There is quite a large number of new and valuable ledges being prospected and developed this season in the country tributary to Sawyer's Bar, and all of the placer mines in that locality make a good showing. It is a good country for a prospector who has ample means to prospect on, but it is no place for a prospector without funds to go to. Like most of the localities in northern California at present, there is only employment enough for the miners who live here, and I would advise miners who are looking for work not to come here with the expectation of finding employment, for when a few more men are needed in any of the mines there are always enough idle resident miners to fill the places, and it is only natural that they would be given work in preference to strangers. What the country needs most is capital to develop its mines, and prospectors with means who can afford the time, labor and money to at least partially develop what they find. The Salmon river country is a difficult one to prospect in, as the mountains are rough, high and steep and thickly covered with brush and timber. The geological formation of this section is favorable, however, for permanent milling ledges, being principally slate, syenite and porphyry. There is one old river channel, or portions of one, rather, which lies about 100 feet above the present river bed, on the south side, that is now being opened up in a few places near Sawyer's Bar. This channel is supposed to be very rich, and no doubt will yield considerable of the precious yellow dust in the next few years to come. ALEX QUARTZ.

Sawyer's Bar, July 1, 1893.

Plumas.

COMING TO THE FRONT.—Plumas *National-Bulletin*, June 29: The mining interests of Plumas are coming to the front, and are attracting the attention of mining men to the county. This is a fact, notwithstanding the moss-backed croakers whose strong forte in life is to discourage enterprise and to criticise those who have the push, the ambition and ability either to develop our mines themselves or to secure the investment of capital for that purpose. Witness, if you please, the big operation on the ridge between Gibsonville and La Porte. By sinking a shaft between four and five hundred feet deep, the Thistle shaft people have developed an immense channel of rich gravel, are taking out lots of gold and employing nearly one hundred men. There are several miles of this channel, doubtless containing millions of gold, which will certainly be worked in future, now that its extent and richness have been demonstrated. In Oakland recently a company was incorporated to operate the Good Hope mine near Onion valley. Near Cromberg, in the Tefft mine, now worked by John M. Jackson, is a large and rich deposit of gravel, a channel from which considerable money is now being taken, and not far from the old Parker place, Pit Trayner has interested Eastern capital in a mining enterprise full of promise. The developments and operations at Granite Basin and in the vicinity of Buck's ranch indicate an era of prosperity in that part of the county, while nearer at home are enterprises in contemplation which, if matured, will revolutionize business in this community. In this connection it might not be inexpedient to say that the opening up of the Elizabethtown channel is one of the probabilities of the near future. Its richness has been demonstrated beyond all question, not only by the large quantities of gold found in early days at the head of the channel, but by the work of more recent years by Loring & Laavitt and others on the line of this rich gravel deposit. What ground they were able to work with the inefficient machinery at hand yielded rich returns. With a small amount of capital to put in place adequate machinery, and at the proper place, it is believed by nearly every practical miner who is acquainted with the history of the Elizabethtown channel that a rich gravel mine would soon be opened up. Should this enterprise be inaugurated, it will employ a large number of men and be the means of scattering more money in, and doing more benefit to, this immediate community than almost any other operation that could be suggested, and we are pleased to know that the prospect for opening up this important mine is encouraging. Development work and the erection of a mill are in progress in the Shenandoah mine in French Ravine. The rich ore uncovered there last fall and winter has inspired the firm belief that a rich mine will result from proper exploration, while the practically inexhaustible deposits of ore and flattering prospects at the Hallsted mine on Rich Gulch argue a bright future for that property, if in the hands of capital. From the above references it will be seen that there is an increasing interest and activity as to Plumas county mines, developed and undeveloped. Attention is being attracted to the county. More prospecting is going on than for years past, and there is a greater disposition to take hold of and develop the mines. Let the good work go on. If continued, we shall return to an era of prosperity—of gold producing in large quantities, of good wages and good markets.

IMMENSELY RICH.—Plumas *National-Bulletin*, June 29: On Monday, C. E. McLaughlin received from H. C. Flournoy an immensely rich chunk of quartz, taken only a few days ago from the mine recently discovered by George F. Brown, above and adjoining the Green Ledge, in Genesee valley. Other samples of ore taken from this mine previously indicated that it was very rich, but this chunk, in richness, exceeds the wildest anticipations of the owners and their friends. The quartz is of a decomposed nature, containing much of dark, decomposed, earthy-looking matter, with an occasional streak of copper stain, and almost matted together with gold. It is one of the richest samples of ore we have ever seen, and weighs probable five pounds.

Shasta.

NEW MILL.—Shasta *Courier*, July 1: Miners are anxiously awaiting for the Miller mill at Middle Creek to be completed, so they can get their ore crushed. A few men have been employed at the mill, which is now ready for the new machinery. Mr. Miller is at present in Arizona. The process he intends to use is an electric-cyanide one, and he expects to accomplish great results with it on the base and low-grade ore of this vicinity. The mine owned by Hull, Murray & Conroy, near the divide between Iron Mountain and Whiskytown, four miles from Shasta, is showing up in a way that is most encouraging to its owners. A fine ledge of good rock that prospects splendidly has been uncovered. It is six feet in the face, and it is the opinion of practical mining men that the owners have got the "deadwood" on a big bonanza. The old Manlove mine on Whisky creek, near Whiskytown, is about to pass into new hands. A company of Ashland men are negotiating with J. P. W. Davis for the sale of the mine, and it is reported that the transfer is soon to be consummated. The parties who contemplate taking the mine are well fixed financially. One of them, a gentleman named Walters, was up to Whiskytown inspecting the property a few days ago. The mill at the Cleveland and Tellurium mine at Middle Creek has been closed down for a while this week in order to transfer the pumping apparatus to the Sacramento river, the water supply in Salt creek having given out. One hundred feet of tunnel was recently finished on the property. There are about 18 men employed there, and the indications are most flattering for the opening of one of the best mines in the county. The tunnel on the Cleveland is in over 300 feet, and the ore from it supplies the 10-stamp mill. They are in about 800 feet on the Tellurium and expect to encounter the ledge very soon. The property is under the able superintendency of Mr. Zoellin. The Burleigh drill has been superceded by the old-fashioned "Armstrong" or hand method. A small repairing force is at work at the Lost Confidence, at Iron Mountain, but nothing will be done there this year at least. Some good shipping ore has been encountered in the Little Maud, on Iron Mountain, recently. Dan Haskall owns a quartz interest in the mine, and a company of San Jose capitalists are interested in it. The extent and richness of the recent strike is to be determined by future development. Flat Creek district has some very promising mines, but their owners have nothing but their own muscle to develop them with, hence matters are a little quiet in that section. Water is also getting too low for the miners. It is reported that a new mill will be erected on the Don Carlos in the near future. J. W. Hocking expects to begin work on his mine near Shasta soon. He has a tunnel in a considerable distance and is close to the ledge, which, although about 14 inches wide in the shaft, is of a quality that is rich enough for Joseph. It is reported that Van Meter and partner took out 11 pounds of gold from a pocket near Lewiston, Trinity county, recently.

NEVADA.

White Horse District.

ENCOURAGING.—Walker Lake *Bulletin*, June 28: News from the White Horse mining district, eight miles north of Wadsworth, is very encouraging, all the assays reported going from $100 to $3500 in gold, and there is much excitement. The ledge has been traced for a distance of four miles. The specimens shown by those who have visited the camp are very rich. Over twenty-five locations have already been made. The ledge is gold bearing and promises to bring this section into prominent notice in a short time. Mr. Gregory, who has been prospecting in that district for the past ten years and has sunk six shafts on the ledge at different points, and shows pay rock in every one of them, has been negotiating with Sacramento parties for three months. The Sacramento parties seem anxious to bond Mr. Gregory's claim and have sent up a bond holding it for six months, with the privilege of purchasing the same at the expiration of that time for $15,000. Mr. Gregory is holding off, not liking to tie himself up. He has great faith in the camp. He is a poor man, however, and has labored under great difficulties in prospecting as far as he has.

Jefferson District.

SILVER MILL RUNNING. — Belmont *Courier*, July 1: The Harrison Brothers have made a rich strike in their silver mine at Jefferson. The mill is still running on ore from their mine.

MONTANA.

GOLD.—Anaconda *Review*, June 29: News received from Princeton and the Royal district this week is of the most encouraging nature, and the miners up there will make a fine showing this season. We are glad to state that all the mines being worked there are rich gold-producers, and the silver mine is dropped like a barren lead of white quartz or antimony. The American Eagle is putting on men every day, and ground is being broken on three distinct parts of the claim with a fine output of rich gold quartz. The Royal property is showing up better than ever, and the owners are working only that part of the vein where gold predominates. The Royal placer ground is being put in shape for big hydraulic operations this season, at the same time they are doing an unusual amount of ground sluicing and using the flush of water in every profitable way, thus giving them a fair show for a good clean-up in this crude way of working their rich ground. The little camp of Princeton is receiving an impetus of business that gives it an encouraging outlook for becoming quite a gold camp in the future. Now that silver has taken a tumble the prospectors are giving their attention more to gold properties. It has been known for a long time that there were a number of gold prospects about the Cable district, and a number of Anaconda parties have gone up there to look after some of them. It has just come to our notice that there are eight or nine of the best claims around there that have been bonded to Col. O'Leary, who is ready to make reasonable propositions to parties with small means that are willing to do development work. This is a chance that does not occur very often, and it is likely that it will not be open very long. There has been considerable talk the past week about the recent strikes on Cottonwood. A *Review* man run onto one of the parties recently from there, yesterday, and from him learned that the recent strike in the Old Companion mine is quite rich and that parties have bonded the group of mines that are owned by Sawyer Nelson and others, for

$45,000, and that there is every reason to believe that the bond will be taken up. The new company has arranged to push work, and has put on quite a force of men. There are a number of other claims staked out, and it is said that the outcroppings are traced for over three miles, all of which have been located. This district is located between the two branches of Cottonwood creek, about five miles from Warm Springs. It is very easy of access. It is down grade all the way from the mine to the railroad. There is every reason to believe that a very good camp will grow out of this new district.

ARIZONA.

IN THE BRADSHAWS.—Phœnix *Gazette*, June 30: The mining about this place was never looking better than just now. Joe Mayer has honded his Yankee Girl to Eastern capitalists, and it is reported that the big deal is closed; consideration not known. This company will erect a 40-stamp mill near the Boggs ranch. Frank Thornton and Ed Crover are making preparations to sink on their claim. This is the property that caused so moch excitement last winter. The ledge is 60 feet wide and will average $14 in gold. The Boggs mine is working a full force, and, under the management of Mr. Woodman, it will again appear upon the roll of the great bullion-producers of Arizona. Packard and McCabe are putting in machinery at their camp. When this property is thoroughly opened up it will rank among the greatest mines in this section. Frank Wright is still working the Little Jessie, and his shipments are quite satisfactory. J. D. James is working quite extensively on his group of mines. His mill is kept busy day and night. I. W. Boggs has a force of men working his property in Eogene golch. Mr. B. has been a very successful miner in the past, and we hope his most sanguine expectations will be met with in his last undertaking. W. C. Clark has completed his sampler at Silver Belt, and it is hoped he will be able to get all the ore he can handle. B. L. Woodman and Olpihant have a lease on the Kit Carson. The ore is very high grade, and if thev find a large body they will have a World's Fair stake. E. J. Austin, the gentleman who owns a large interest in the Santa Maria mines, was here a day or two since. Mr. Austin is very enthusiastic over this property. The ledge is 30 feet wide and assays from $30 to $50 per ton. It will be several months before much work is done there, but before many months it will be the liveliest camp in Yavapai connty. Mr. Austin has had maoy offers for it, but he refuses all. Professor James Dooglas was here this week looking after the interests of the Commercial Mining Co.

DAKOTA.

LOOKS LIKE GOOD GROUNO. — Deadwood *Pioneer*, June 29: What our informant, an old and experienced miner, pronounces one of the most important ore strikes ever made in the Black Hills, is reported as having been made northwest of Elk Mountain, on a branch of Squaw creek. It is on ground owned by Levi Ebeling, Wm. K. Howard and John Delaunay, and consists of a vertical vein of dry cement ore 2½ feet thick at the top and assaying at an average of about $70 to the ton. The vein is known to extend clear through the hill, a distance of 1300 feet, as it bas been well opened at both ends, and the owners are now driving a drift from the west side to crosscut it well io. The drift is in 200 feet, and will, it is expected, find the vein inside of a week. This strike, as seems to be happening quite frequently of late, is on an old property on wbich considerable work had formerly been done, but without finding the ore vein. Quite a bit of work has been done on it during the last two years, but it was only recently that the vein spoken of was discovered. It increases in width as it goes down, ahd has every indication of being a large body. Contiguous to this property on the northwest is the McDonald ground, on which a rich vertical vein of the same formation, and which is supposed to be a continuation of the Ebeling vein, has been discovered. The assays from this latter vein run high, showing in many places as much as $180 to the ton. Two thousand feet to the south from the Ebeling vein David Arnold and A. S. Farrell are prospecting a similar vein, or crevice, showing on the top from 15 to 20 inches in thickness, but which assays much lower than either of the others. It lies nearly parallel with the Ebeling vein, and was discovered at a depth of 26 feet, in an old sbaft, which is now being cleared out for extension. These latter gentlemen have a group of 11 claims, and will prospect their present find in tbe hope that it may show up as rich as its neighbors on the north.

UTAH.

AT PARK CITY.—*Record*, July 1: The present week has been a gloomy one in mining circles in the Park, owing to tbe great tumble in the price of silver. The result was that the Daly West, Crescent, Anchor and Silver King closed down and a great number of men were thrown out of employment. The miue owners, however, were confident that the white metal could not be downed, and felt that it was only a question of a short while until it would recover and the mines be able to resume. Their faith was rewarded even sooner than anticipated, and authentic information received this morning showed that their faith was well founded, for silver jumped up to 70 cents. The Anchor and Silver King at once issued orders for the morning shifts to report for duty immediately after the Glorious Fourth. This good news has caosed the town to take on a gayer look, long faces to shorten up and take on a smiling appearance and gloom to give way to sunshine. It is confidently expected that the Crescent and Daly West will follow the lead of the other properties and resume at an early date. Secretary Cole of the Crescent informed the writer that he had been talking with Manager McGregor this morning and that gentlemao had informed him that if the 70 cent quotation on silver was correct the Crescent would resumed at once.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JUNE 27, 1893.

500,526.—PRUNING IMPLEMENT—D. Behmer, Santa Rosa, Cal.
500,465.—CURRENT MOTOR—J. T. Bibb, Tacoma, Wash.
500,527.—PLATFORM—J. B. Brickley, Port Angels, Wash.
500,111.—BILLET-LOOP—F. J. Bringham, Oroville, Cal.
500,469.—BOUQUET-HOLDER—G. A. Burbank, Portland, Or.
500,537.—TRAIN TABLE—A. J. Culbertson, San Andreae, Cal.
500,474.—BITUMINOUE-ROCK MACHINE—W. A. Doble, S. F.
500,485.—ARTIFICIAL STONE—H. Gallinowsky, S. F.
500,491.—LINE-HOLDER—J. H. Griswold, Oakland, Cal.
500,493.—GRATE—J. J. Hall, Willow, Cal.
500,495.—ASPHALT-BOILER—A. Haskins, S. F.
500,497.—SHOELACE-FASTENER—Cornelia F. Hathaway, S. F.
500,253—HARROW—Johnson & Syvrnd, Shelton, Wash.
500,399.—CABLE-PROTECTOR—A. W. Lackey, Gold Hill, Nev.
500,405—GANG PLOW—J. F. Lucas, Centerville, Wash.
500 516.—HARNESS—Snell & Weldon, Santa Barbara, Cal.
22,561.—DESIGN FOR SPOON—W. S. G'Brien, S. F.

The following brief list by telegraph, for July 5th, will appear more complete on receipt of mail advices:

California—Antonio Speal, Loe Angelee, forging hammer; William W. Andrews, Fallbrook, rotary engine; Gustave H. Carlson, San Francisco, eplint laundry basket; Henry Haustein, San Francisco, frame for illuminating tiles; Adam Jeffreys, San Francisco, cable releasing device and orossing; Joshua Swanberg, Loe Angeles, fruit picker; James Nolan, Oakland, gae generator; Silas Pruden, Los Angeles, naillese horseshoe; Carrie S. Cox, Spotswood, pump; William Falconer, Selma, land leveler; Mark Anthony, Berkeley, display stand; Antone G. Rose, Fresno, traction wheel; Richard Savage, San Francieco, ohimney or emokestack; William F. Hess, San Francieco, press for packing bank notee or other currency; Delbert E. Barton, San Francieco, cultivator; Jamee W. Stanley, Gakland, injec'or.

Gregon—Charlee A. Clark, Portland, street sprinkler; Emil Ohrietenaen, Portland, machine for connecting button shanks and fasteners; John J. Dugan, Salem, bedstead; Albert M. Gruhbs, Forcet Grove, game; Joseph L. Lowell, Althouse, car coupling.

Arizona—Joseph L. Giroux, Jerome, steam generator and smelting furnace.

Nevada—John P. Foulks, Verde, air motor.

Washington—William Keywood, Tacoma, automatic air brake.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of soecial mention:

ANIMAL SHEARS.—Arthur D. Reynolds, S. F. No. 499,938. Dated Jone 20, 1893. This invention relates to a sheep-shears and the mechanism for operating the same. The object of the invention is to provide a novel mechanism in connection with cutting shears whereby the jaws of the latter may be reciprocated at a rapid rate of speed; also a means for disengaging the driver at will and a means for guiding the reciprocating parts and for retaining the jaws of the blades closely together.

ROPE-LEADER FOR WINOING DRUMS.—Norton H. Pine, Eureka, Humboldt Co., Cal. No. 499,934. Dated Jone 20, 1893. The invention relates to a rope-leading device for winding drums and consists in a mechanism whereby the rope is caused to wind evenly from one end of the rope to the other, and in an automatic means for reversing the movement of the leader upon reaching either eod of the drum. The object of this invention is to provide an improvement upon a device for a similar purpose patented January 31, 1893; No. 490,984. The present invention relates more especially to the mechanism for reversing the movement of the traveler.

RE-SAWING MACHINE.—Andrew J. Haskell, S. F. No. 499,424. Dated June 13, 1893. In the osual construction of re-sawing machines for lumber it is customary to have two oairs of vertical adjostable rollers between which the lumber to be re-sawed is caused to pass, and by which it is fed to the saw. These rollers are driven by gearing so as to rotate simultaneously in the desired direction. The object of the invention is to do away with a part of the rollers and to substitute an improved means for driving and regulating the speed and certain other details. Certain plates take the place of the rollers formerly employed, and, as they extend well along on each side of the saws, they steady and guide the lumber to prevent aoy irregular movement or variation in the thickness of the two sides. This greatly simplifies the construction of re-sawing machinery.

CONTINUOUS FILE OR INDEX.—Alexaoder J. Rudolph, S. F. No. 499,443. Dated Jone 13, 1893. This continous file or index consists of a series of cards, the faces of which are adapted to receive slips containing the subject-matter of the index, said cards being hinged or linked together at their edges to form a flexible belt; pins projecting from the ends of certain cards in the series; a support upon wbich these pins are carried so that the cards hang in folds of any desired length upon the support; a means for changing or adjusting the pins so that any even number of slip-holders may be introduced at any desired points without altering the hanging of the cards; and in certain details of coostruction and operation. The present invention covers certain improvements on the device patented by the same inventor Sept. 27, 1892, No. 483,312. It is intended maioly for use in large libraries.

The Pacific Mining Agency and Trust Company.

A Corporation Organized Under the Laws of the State of California.

Office: Mills Building, Roome 1 and 2, Ninth Floor, San Francisco, Cal.

Owners of mines desirous of disposing of their properties often have difficulty in finding purchasers, while at the same time there are plenty of people who would invest in mines were they able to obtain exact information concerning them without a personal visit to the properties or without engaging the services of an expert.

The mines are in the mountains or in the foothills more or less distant from the centers of capital where investors are to be found. If the miner comes to the city to negotiate the sale of his property, he does not know to whom to apply; while, if the capitalist is seeking a mine, he has no source of information which will indicate the exact localities where good properties are avallable.

These conditions have resulted in the growth of a class called "*middlemen*" or promoters, who bond the mine from the owner for a specified time, during which they seek a purchaser. The evils of this system are many, but chief among them is the *excessive cost to the purchaser*, while the seller is not henefited beyond his orlginal price.

These promoters, in order to reap a large reward from a single transaction, on which they may work for months, *double, treble or quadruple the original price*, taking for themselves and associates the lion's share of the profit. The result is that mines which would pay a handsome interest on the investment of the sum asked by the owner, fail to realize a suitable profit on the price which has to be paid to the promoters; moreover, the advanced price necessitated by this system often prohibits a sale, and the mine remains tied up during the existence of the bond. There is also an incentive to misrepresentation and exaggeration on the part of these intermediaries, who generally have never seen the property they have for sale.

The mine-owner and purchaser both suffer from this plan of negotiating mining properties. The owner's opportunity of effecting a sale becomes materially lessened after one or more failures from this source since this necessarily results in a diminution in value; and if a purchaser buys at an unwarranted cost his expectations are not realized.

All these features, now well recognized, have discouraged investment in mining properties, much to the injury of the mining industry, owners aod prospectors.

One of the objects for which the PACIFIC MINING AGENCY AND TRUST COMPANY was formed is to try to sell mines and mining claims and ditch properties and water rights *on commission*, and to act as agent and broker for the sale and purchase of such properties. It is intended, however to eliminate the objectionable features of the "promoter" system above alluded to, by placing the property on sale at the price fixed by the original owner, without any advance and charge the said owner a suitable commission, to be previously agreed upon.

In other words, it is intended to conduct the purchase and sale of mining claims and ditch properties and water rights on the *same basis as a real-estate transaction*. The seller will be asked for a suitable description of his property, with maps, statement of development, record of title, and, if possible, a report upon it from some reputable mining engineer or expert. These papers will be placed on file in the office of the Company, for which service a fee will be charged in advance. All this will be readily accessible to any person looking for investment in this direction, and it is expected that the standing of this Company will be such that the information in its possession will be sought for.

It is not proposed to do more than to conduct the negotiations between the *buyer* and *seller*. *The Company is prohibited by its articles of incorporation from buying or selling except upon the commission or a agent or factor of others.*

The buyer pays no fees whatever, and there is no incentive to advance the price beyond the original figures at which the price and commission have been fixed.

The commission charged by the Company will he a matter of private agreement with the owner, based on the magnitude of the transaction, rangIng from 5 per cent net as the minimum to 20 per cent as the maximum.

The subject of *expert examination* of properties will be a matter of private arrangement between the Company and buyer or seller.

This, in brief, is the system by which the PACIFIC MINING AGENCY AND TRUST COMPANY proposes to conduct the purchase of mining and ditch properties. It is desirous of obtaining such properties from first hands so that matters may be conducted on a legitimate business basis, and does not wish to negotiate with those who are asking exorbitant and unwarrantable prices by reason of their intermediary position.

It is not intended only to negotiate the sale of an entire property, but interests in such may be sold, or money obtained for development work, erection of reduction plants, purchase of machinery, and so forth, under suitable conditions.

The Company has no lotention of having any transaction in mining stocks, there being already plenty of opportunities for dealing in that direction. It is in a position to acquire and impart information of any kind relating to the merits, value and title to mines, mining claims, water and ditch properties, and water rights.

Non-residents who have *interests* which they wish looked after, or concerning which they desire *special information*, may obtain the services of the Company, for which a fee will be charged in accordance with the character of the work to be done.

The PACIFIC MINING AGENCY AND TRUST COMPANY will endeavor to assist mining engineers, superintendents, foremen, miners, mlllmen, assayers, and others connected with the mining industry, to obtaln employment. Those desirous of our assistance in this connection will be required to fill out a blank (which will be forwarded on application) setting forth the positlons required, wages expected and references. A small fee will be charged those who obtain positions by this means. Correspondence is solicited from managers, superintendents, and others in need of men.

The Company does not confine its operations to the State in which its principal place of business is situated, but includes all the principal centers of mining operations in the United States.

Arrangements are being perfected for suitable connections in New York, Chicago, Boston, London, Paris and other important financial centers, and agents will be selected in the larger mining towns of the Pacific States and Territories.

Those who conduct the business of this Company have had long experience in mining operations, and it is their intention to place it in a position to inspire the confidence of the community in its integrity and fair dealing. Every one at all familiar with such matters knows the *difficulty* which has existed in bringing the *buyers and sellers* of mines together and of obtaining desired information concerning the various matters connected with the business. This Information the Company proposes to supply to those requiring it; and it expects to negotiate the purchase and sale of mines at the *least expense* and *trouble* to the *interested parties*.

Mine-owners, managers and superintendents are invited to call at our offices when in San Francisco, or to correspond with the Company on the subjects herein referred to, and further particulars will be promptly supplied on demand.

Market Reports.

The Markets.

SAN FRANCISCO, July 6, 1893.

Following the break in silver of last week, and the unprecedented depression of prices, there has been a reaction that seems fair to restore silver to the position it occupied before the closing of the Indian mints. The New York market was quicker to go down and quicker to recover than the London. The turn in the tide occurred last Friday, when silver in New York advanced from 62 to 63 cents; the following day it was up to 70, and yesterday silver touched 75 in New York. In London the lowest point was reached Friday, but yesterday it had advanced to 34d from 30½d.

Inquiry at the Treasury Department yesterday as to whether the amount of silver offered the Government was as large now as formerly, developed the fact that for the first six months of the current calendar year the offers aggregated 52,300,000 ounces, while for the same period last year they were only 45,350,000, showing an excess for the corresponding period this year of 6,950,000, which would indicate that the production of silver is not falling off in the United States. The amount of silver bullion imported for the first six months of the current calendar year, including that in ores, was 8 471,000 ounces, while there has been exported 11,968,000 ounces. Of the amount of silver effered to the government during this period, 27,000,000 ounces were purchased. The proposition which has been talked of about a resolution being introduced at the extra session giving the President power to suspend—until such time as he may see fit—the purchase of silver hullion, is one that does not meet with approval, and the silver men say they would fight such a proposition with as much vigor as they will the repeal of the Sherman law; for they believe the effect of such a resolution in the hands of Cleveland, whose views on silver are well known, would he the same as repeal.

Coinage of Indian Mints.

Since 1875 Indian Mints have annually turned out the following amounts of silver coins, as expressed in American dollars:

1875	$23,830,686
1876	12,410,636
1877	30,518,415
1878	78 741,556
1879	28,122,004
1880	40,002,173
1881	20,682,625
1882	29,386,322
r883	24,927,400
1884	17 353,531
1885	48,487,114
1886	27,121,414
r887	44,142,013
1888	36,297,132
r889	37,927,814
r890	57,931,323
1891	32,670,498
Total 17 years	$590,562,656
Annual average	34,150,714

The coinage for the calendar year 1892 is not at hand, but is supposed to have been about $30,000,000. The figures in the above table are for the calendar year.

NEW YORK, July 6.—Following are the closing prices for the week:

Mining Share Market.

The stock boards opened for business after the holidays on Wednesday, but found it rather dull times. News from the mines, however favorable, had little effect. As the principal properties dealt in on the stock boards are silver-producers, and silver is at the biggest discount ever known, it is hard to put any life into the market. Although the mines in Colorado, Montana, Idaho and Utah are shutting down, so far the Comstock has escaped, though there are few men now employed there as compared with a few years ago. The large percentage of gold in the ores of the principal mines is greatly in favor of the Comstock. Still the trading in shares is by no means an exciting business in these days, when changes in value are in cents instead of dollars. Sales are moderate at low prices. The companies put off their delinquent sales as long as possible because they often have to buy in most of the stock on company's account.

MINING SHAREHOLDERS' DIRECTORY.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples; rules, and tables are prepared. Thus the needs of the scientist and the practical minor or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculatione; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Trlangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

RISDON IRON WORKS.

CONOVER INDEPENDENT BELT-DRIVEN CONDENSER.

An 800 H. P. Belt-Driven Condenser in use at the O. S. L. & H. E. Ry. Power House, and a 200 H. P Steam-Driven Condenser is being put in for the A. O. & P. El Ry.

In this Condenser the aim is — to supply the most efficient condensing apparatus, and at the same time reduce the power required to operate it to the minimum.

To do this under all conditions, the apparatus is arranged in two forms —Belt and Steam Driven.

In the Steam-Driven Condenser, the Air-Pump is driven by a Special Compound Condensing Engine. This engine is connected direct to the shaft without gearing, and is compound condensing, and fitted with complete Corliss cut off valve-gear and dash-pot. The entire apparatus is arranged on one base, and is wholly self-contained.

The design of these Condensers allows the Easy Inspection and removal of all parts.

The apparatus is also very Simple and Durable, and requires the least attention to operate.

We are prepared to furnish these Condensers promptly, from Twenty-Five to Five-Thousand Horse-power each.

Manufacturers of

IMPROVED MINING, MILLING, MARINE AND OTHER MACHINERY,

OF ANY REQUIRED MAGNITUDE.

BRYAN ROLLER QUARTZ MILLS. JOHNSTON CONCENTRATORS.

CONTRACTORS FOR COMPETE STEAM-POWER PLANTS,

WATER WORKS for TOWN SUPPLY, IRRIGATING PLANTS, ELECTRIC LIGHTING AND ELECTRIC RAILWAY MACHINERY, CABLE ROAD MACHINERY.

Mill and Mining Appliances of All Kinds.

SUGAR AND ICE MACHINERY.

WE ARE AGENTS ALSO FOR

HEINE BOILERS.
McCLAVE ROCKING GRATE.
HAWLEY SMOKELESS FURNACE.
INJECTOR CONDENSERS,
WEBSTER VACUUM HEATERS and PURIFIERS.
BALL AUTOMATIC ENGINES,
IMPROVED WHEELOCK ENGINES, WITH HILL VALVE GEAR.
BARAGWANATH FEED WATER HEATERS AND TRIPLEX PUMPS,
DAVIDSON AND MARSH STEAM PUMPS,
BALDWINVILLE CENTRIFUGAL PUMPS,
DE RYCKE CENTRIFUGAL STEAM SEPARATORS.
PHILLIPS METALLIC PACKING.
RYAN-McDONALD HOISTING ENGINES,
HYDRANTS, WATER GATES, Etc., Etc.

MANUFACTURERS FOR THIRTY-THREE YEARS.

CALIFORNIA WIRE WORKS

OFFICE, 9 FREMONT ST., SAN FRANCISCO, CAL.

LOS ANGELES AGENCY, LOS ANGELES, CAL. PORTLAND AGENCY, PORTLAND, OREGON.

WIRE ROPES
For Mining, Hoisting, Transmission of Power, Etc.

WIRE CABLES
For Cable Railways, Etc.

WIRE RIGGING
For Ships, Derricks, Etc.

WIRE of all kinds
Best Steel.

WIRE NAILS,

BARBED WIRE,
Regularly Licensed.

HALLIDIE'S PATENT WIRE ROPEWAY

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORE AND OTHER MATERIAL.

Erected by us during the past Fourteen Years in Spans of from 200 to 2000 feet. Simple, Economical and Durable. Have been Thoroughly Tested in all Parts of the Country

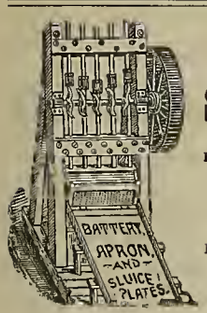
BATTERY SCREENS AND WIRE CLOTH.

Agent for HOSKINS'
HYDRO-CARBON ASSAY FURNACES.



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD
In Quartz and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 5000 ORDERS FILLED. TWENTY MEDALS AWARDED. Old Mining Platee can be Replated. Old Platee Bought, or Gold Separated. These Platee can also be purchaeed of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor. 653 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 25 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper.
SEND FOR CIRCULAR.

PIONEER ESTABLISHMENT OF THE PACIFIC COAST.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Platee and Beet Gold, Silver and Nickel Plating.

Drift Mines in Placer County.

Continuing Mr. Ross E. Browne's description of the ancient river beds of the Forest Hill divide, commenced in the last number of the PRESS, he says that from the frequent displacement of the streams during the second period described, there have arisen various complications in the channel systems. Although the mining developments are extensive in portions of the district, it still remains a difficult matter to separate the channel systems of the second period, and it is not always easy to distinguish between those of the first and second periods. In a general way it may be said that the channels of the second period differ from those of the first as follows: their beds are narrower, rims steeper, and accumulations of bedrock gravel incomparably smaller.

The following may be said concerning the gravels in the deeper channel bottoms, and their immediate volcanic cappings: The characteristic channel deposit of the first period consists of a large body of gravel of exclusively bedrock material, and a light cement capping; the characteristic channel deposits of the second period, either of a small body of bedrock gravel and a heavier cement capping, or of a large body of volcanic gravel and a heavy volcanic conglomerate and cement capping.

A continuous cap of so-called pipe-clay generally indicates the first period.

Where one deep channel cuts across the deposit of another, the channel which does the cutting belongs, as a rule, to the second period. The channel which has been cut may belong to either period. A careful study of the immediate volcanic caps of the gravel deposits by a competent specialist in petrography may lead to important criterions in classifying the channels. It will be evident that Mr. Browne's opportunities have been mainly for a study of the topographical features.

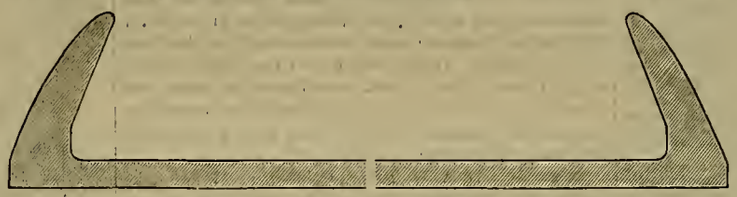
There occurs occasionally very large accumulations of bedrock gravel between the deposits of volcanic cement, which are evidently the result of the cutting and dislodgement of sections of the old deposit. (See figure 6; figure 5 is omitted.)

The upper body of quartz gravel shown in the figure is such an occurrence. It has not been explored to any great extent, and the limiting lines in this section are conjectural.

The section in figure 6 shows an interesting occurrence. The cement filling the bed to a depth of 100 feet is a more uniformly fine-grained sediment than is commonly encountered. It incloses a number of oak and cedar trees standing on the banks of the channel, with the roots intact in the gravelly soil and bedrock. One of these is a cedar nearly 100 feet in height and four feet in diameter at the base, and stands perfectly upright, and, considering its age, is in a surprising state of preservation.

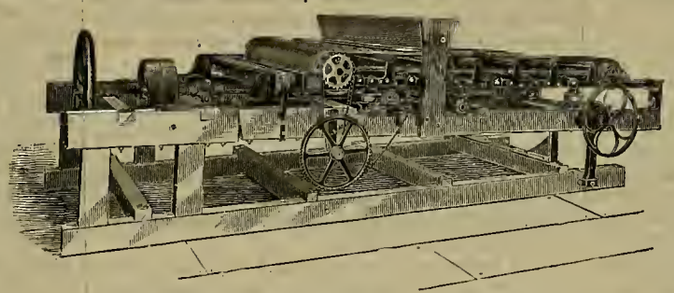
Similar standing trees are found in the Bowen mine, in the same channel. These trees are immediately on the shore line of the shallow deposit of gravel, and show that for a few centuries at least before the depositing of the volcanic material the stream was a small one. (See figure 7.)

These standing trees show also that the first flow of the cement was not torrential, though moving with a certain velocity. The existence of a current and its direction are plainly indicated by the structure of the deposit immediately surrounding the trunks of the trees.



CROSS SECTION OF BLASDEL CONCENTRATING BELT.

The Weske channel is apparently one of the earlier channels of the second period. It is cut by a slightly deeper channel, which is filled to a considerable depth with a coarse, volcanic gravel, containing large, water-worn bowlders of lava, mixed with a certain amount of coarse bedrock gravel. The whole is capped with hard cement and conglomerate. By following the course of the Weske channel it will be seen that it, in turn, cuts and recuts the Paragon and May Flower channels.



THE MC GLEW ORE CONCENTRATOR—*See page 35.*

BURIED TREES IN FOREST HILL DIVIDE DRIFT MINES.

The Blasdel Concentrating Belt.

This practical invention is the result of many years' experience in the milling and concentration of gold and silver ores. The difficulty which formerly attached to the use of a flanged belt has been overcome by constructing the flanges at an acute angle toward the center, thus enabling it to pass over the end rolls or drums of the machine without breaking or cracking. This adds to the durability of the belt, and millmen have been quick to recognize its advantages. It is claimed that these belts will handle more pulp and will save a higher percentage of values of the material passing over them than others, because at intervals of two feet there is a space of one inch in the surface of the belt which contains 20 riffles, one thirty-second of an inch in depth. These are very effective in saving floured sulphurets (which are always the richest) and quicksilver that would not stop on a smooth belt.

These small riffles prevent channels from forming down through the center of the belt and the sand from packing on the edges. They have great value when used below settlers in pan-mills, saving not only sulphurets and globules of quicksilver, but also the granulated, which carries off much of the precious metals.

Ore-concentrating machines have added more to the material wealth of the country than people not engaged in the business have any idea of. There are reports from a number of mines where the value of the sulphurets is more than double that of the free gold extracted; and from one mine crushing 80 tons per day, the free gold extracted by passing the pulp over amalgamated plates is only about $1 per ton, while the yield from the sulphurets is over $3.

One party having 20 stamps which had run for some years without using concentrators, believing the percentage of sulphurets was so small that it would not pay, was induced to try them, and found that his income from the 20 stamps was increased over $40 per day, which had hitherto been lost. Some mines, in addition to the value of the sulphurets, have rusty gold that will not amalgamate by passing over plates. This, of course, is saved when passed over concentrating belts.

The accompanying (cross section) cut gives a fair idea of the flanges as herein described.

Many of the Blasdel belts are already in use, and the demand is increasing as their merits become better known.

BAD FOR PENINSULA MINING.—Pedro Victoria, Collector of Customs at Ensenada, has received a circular advising him that the export tax on bullion from Lower California will from July 1st be $75 per thousand, or nearly 8 per cent. The rate for some time past has been about 3 per cent. The new duty will have a bad effect on the mining industry of the peninsula.

THE East Wellington coal mines at Nanaimo, B. C., were closed down Tuesday, owing to the decision of the miners, who refused a reduction of 20 per cent. The men held a meeting last Sunday and decided to accept a reduction of 10 per cent. This was accepted by the manager until further instructions.

The Silver Men Active.

The free coinage men and silver miners are holding conventions and mass meetings all over the country. They are passing resolutions selecting delegates to coming conventions and busying themselves in every way in behalf of the white metal. The Colorado State Silver Lesgue at a meeting in Denver this week, listened to some pretty warm speeches, armed revolution being practically advocated by Governor Waite. Judge Kerr of Pueblo spoke in the same inflammatory vein as Governor Waite. He indorsed the recent revolutionary telegram sent East, in which it was declared that if the war upon silver continued it would result in the West repudiating all of her obligations; that 150,000 men would be paupers, that 500,000 people were on the verge of starvation, and that revolution would be the final result. It was then moved that the convention indorse the remarks of Governor Waite. The motion was carried amid the greatest enthusiasm. The committee on resolutions has adopted an address to the people of the United States warning Eastern capitalists that wide-spread ruin will follow the repeal of the Sherman Act. They state that there are already 15,000 idle miners in Colorado, and there will soon be 400 more from the smelters.

A silver mass meeting called by three organizations—Board of Trade, Chamber of Commerce and Business Men's Association—at Lester Park Pavilion, Ogden, on Tuesday was attended by thousands of people. Permanent organization was perfected, A. B. Patton, President of the Board of Trade, being elected chairman. Radical silver speeches were made. The object of the meeting was to further organization in Utah Territory and elect delegates to the Silver Conventions at Denver, St. Louis and Chicago.

In Montana the Free Coinage Association met, organized and adjourned within 24 hours, but did lots of business in that time. Never before in the history of the State has there been such a convention. Never were so many interests represented and working harmoniously, zealously and effectively for the accomplishment of a result. Mine owners, mine managers, smelting and milling superintendents, bankers, business men, State and federal officials, lawyers, laboring men, physicians and even ministers of the gospel worked and voted as one man. A large list of delegates—all prominent men—was selected to go to the Bi-Metallic League in Chicago, and afterward to Washington.

At Spokane, Wash., the sentiment of the big meeting was unanimously in favor of sustaining silver and upholding the mining industry of that section. A resolution was adopted calling upon the members of Congress to demand free and unlimited coinage of silver and oppose the unconditional repeal of the Sherman Act. All the silver clubs of Nevada have been called together in mass convention in their respective localities to pass resolutions or protest against the repeal of the Sherman law. Most of them will meet July 15th. Delegates will be chosen for the Chicago convention.

We have not space for the various resolutions adopted, which, however, were much of the same tenor, denouncing the "gold-bugs" and protesting against the unconditional repeal of the Sherman Act.

Cost of Production of Silver.

The cost of production of silver is a very serious question in these days. Most of the miners say they cannot produce it at any profit when it is less than 80 cents an ounce. Some of them cannot do it for that. A recent investigation by U. S. Senator Stewart resulted in showing that it cost more than it was worth at par value to produce it. In a report of the Senate Committee on Mines and Mining there is much interesting testimony. Prof. James D. Hague says the cost of production on the Comstock per ounce of fine silver ranged from a minimum of 35 to 40 cents on the production of the big bonanza in its most prosperous period, and disregarding all prior and subsequent assessments to a maximum of $2.10 on the production of non-dividend paying mines. Taking all their assessments into account, the average cost of all the silver produced on the whole lode from the beginning has been $1.10 per ounce. The average cost of the silver product of the United States for 1891 was 85 cents per ounce, not allowing for assessments or other forms of new capital invested in the business. The following are fair samples of the mass of testimony:

Ex-Senator H. A. W. Tabor, Colorado: "If we take into account the large plants of machinery left on exhausted mines, and the many millions of dollars' worth of work without results, silver costs, as a whole, $1.50 an ounce."

Ex-Senator N. P. Hill, Colorado: "My opinion is that, adding to the cost the losses of all the unprofitable enterprises in silver mining, the total average cost for the past ten years in producing silver in the United States would amount to more than $1.29 per ounce."

W. C. Wynkoop, editor of the *Mining Industry and Tradesman*, Denver: "In 1890 I secured the reports of about 160 incorporated mines which produced silver during the preceding year. Taking the companies which did not make a profit in connection with those which did, the cost was about $1 15 per ounce." For the whole United States, Mr. Wynkoop believes the silver produced has cost on an average of $2 an ounce.

W. F. Reinert, editor of the *State Mining Journal*, Denver: "I think it quite safe and very conservative to estimate the average cost of producing an ounce of silver in Colorado at from $1.50 to $1.75."

Louis A. Garnett, San Francisco, estimates the cost of the silver produced on the Comstock at $1.50 per ounce. Simeon Wenban, of San Francisco, states that he can furnish bullion from one of his mines in Nevada at a cost of 63 cents per ounce, but thinks that all the silver produced in Nevada has averaged not less than $1.30. William H. Watson and L. A. Raymond, San Francisco: "We can safely say in our experience that every dollar of silver we obtained cost us at least $2." William E. Sharon, James H. Kinkead, D. B. Lyman, A. J. McDonnell, E. Boyle and C. C. Thomas, the leading mining superintendents on the Comstock: "The cost of producing an ounce of silver on the Comstock to-day is $1.37." R. K. Colcord, Governor of Nevada, puts the cost of all the silver produced in that State at over $1.50 per ounce. Surveyor-General J. E. Jones, Nevada, estimates it at from $1.50 to $2.

The report states that 99 per cent of the supposed discoveries and locations of mining claims on which money and labor have been expended have produced nothing and are failures. All this appears to be charged up to the productive mines, as regards the value of their output.

In the report of the Director of the U. S. Mint for 1887 is a very elaborate statistical article on this subject of cost of production of silver. In that is an abstract of a report of Prof. Roberts Austen, chemist to the Royal Mint, on this same subject. In this is considered (1) silver contained in gold, or silver obtained from refining native gold. Silver from this source is estimated as costing 2½d, or only five cents per ounce. In (2) silver contained in lead ores, or obtained by the desilverization of lead, the cost is estimated at 2s. For silver contained in copper ores, or obtained by the desilverization of copper and cupriferous products, the cost is 1s 11d. For silver ores, or silver obtained from ores in which silver is the principal metal, the cost is 1s 5d. The mean cost is 1s 8d, or 40 cents per ounce. This surprisingly low estimate is reached not only by the exclusion of cost of real and personal property and plant, or interest and amortization on expended capital, and cost of transportation or of exploration and development; but, in the case of the major part of the product, costs of mining and reduction.

The U. S. Mint Director in that same year addressed interrogatories to producers in this country, and received many replies. The results were not very satisfactory, but serve as the best basis attainable. From the appended calculation it will be seen that for the given selection of enterprises in California, Arizona, Colorado, Montana and Utah the mean cost of producing one fine ounce of silver, the selection being limited to 155 in number, is not less than $0.524. This is exclusive of all allowances on capital account for amortization. The 12 enterprises selected in Montana produced two-thirds of all the silver of that region. The five mines in Utah yielded over two-thirds of the product of that Territory. The Colorado properties were distinctly silver mines. The Daly and Ontario were included in the Utah mines. The four California mines were producing silver and no gold. The summary is as follows:

State or Territory.	Number of silver mines selected.	Product of silver—Fine ounces.	Average working cost of producing one ounce of refined silver	Total working cost of producing silver	Mean working cost in ounces.
Arizona	5	1,119,562	$0.832	$931,475	
California	4	237,737	.51	121,246	
Colorado	129	4,420,642	.61	2,696,691	
Montana	12	8,072,993	.433	3,495,506	
Utah	6	3,804,453	.525	1,997,338	
Total	155	17,655,387		$9,242,256	$0.524

A Steam Generator and Smelting Furnace.

Joseph L. Giroux, of Jerome, Arizona, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an invention to combine with a smelting furnace devices for generating steam whereby the heat employed in smelting the ore is utilized in producing steam power to be used for driving engines and other machinery. The furnace is of usual construction having the stack and feed door. The body of the furnace is composed of concentric outer and inner walls. The outer wall is preferably made of boiler iron, and the inner wall is made of heavy copper and the two are connected together by numerous stays to resist the pressure which is generated between the two. There is a brick lining of the crucible in the lower part of the furnace and upon which it is supported. There is the usual settling pot into which the slag is discharged from the slag tap and an overflow pipe which delivers the slag after the pot is full.

A water tank is so situated with reference to this discharge overflow pipe that the slag falls into the water tank where it becomes disintegrated and granulated and falls to the bottom. The water is thus heated and displaced and flows over into another tank placed beside the first one. From this latter tank the heated water is pumped into the jacket surrounding the furnace, being delivered around the bottom and rising as it is heated. Whenever a sufficient amount of slag has been received into the first tank a gate is raised and the water will wash the granulated slag out.

This first water tank into which the slag passes is designed to hold about 500 gallons of water, and by the discharge of about 100 gallons the slag will be cleared out from it at any time. From the upper part of the jacket which surrounds the furnace four large pipes lead to a boiler. This boiler is situated at such an elevation with relation to the water jacket of the furnace that the latter will always be kept full of water, and it and the boiler are constantly supplied to retain the proper level in the boiler by means of the pump before referred to, the water being heated so that it is delivered into the water jacket at very near boiling point. By means of the large connecting pipes, a free discharge of steam into the boiler is permitted without its carrying the water with it. The lower part of the inner jacket is curved so that the space at the bottom of the jacket is shaped to easily deliver and discharge through a valved outlet any sediment when the jacket is to be washed out. There is an air-drum surrounding the furnace and having six or more tuyeres opening therefrom in the usual manner.

Mr. Giroux, in his drawing, shows additional small tuyeres passing through the brick lining of the crucible by which a supplemental blast may be introduced, thus making the smelting more rapid.

By this arrangement the inventor states he is enabled to provide one or more steam boilers with any desired steam pressure and keep it up as long as the furnace is in operation, while, at the same time, the slag is easily disposed of. It serves to heat the water before the latter is introduced into the water jacket, and the labor of removing the slag from the furnace is dispensed with. The small tuyeres spoken of are connected with an air-compressor which will give an air pressure of about ten pounds, while the blast drum from which the air is delivered through the other tuyeres is supplied from a blower which will give a pres-

sure of abont ten ounces. The reason for this is that the air from the main tuyeres is delivered among the loose ore and fnel and easily passes through it, but the air from the small tuyeres is delivered directly into the melted metal within tbe crucible, and must, therefore, have snfficient pressnre to overcome that of the metal and prevent the latter from entering the tnyeres.

The McGlew Ore Concentrator.

One of the latest candidates for public favor among the endless belt concentrators, now the favorite type, is the McGlew, an engraving of which is given on this page. The work recently accomplished by tbis machine on the Shasta county ores has attracted tbe attention of mining men, numbers of whom are visiting the oompany's works at 132 Main street to see it in operation. As will be seen from tbe cut tbe main frame is of wood, carrying the table and revolving belt. The upper portion of this frame is hinged so that the lower end may be raised or lowered to alter the inclination of the belt. Tbis hinged part of the frame carries the iron table above wbich the belt operates.

The iron table rests on four steel balls which are in sockets one at each corner, thus admitting of tbe table being given tbe necessary motions similar to that of a miner's pan or batea. The belt itself is preferably of canvas suitably waterproofed. In the edges of the belt are strong ropes which fit in grooved rollers at top and bottom keeping the belt perfectly in position and preventing it getting ont of line or off the rollers. As the upper part of the rope on each edge projects above the belt it serves as a sort of flange to keep the material being treated passing over the sides of the belt when side sbake is imparted. As will be seen from further description this belt is entirely independent of the motive power; tbat is, it is operated by the mechanism and operates none itself.

Rnnning lengthwise the machine and under tbe table is the driving shaft having the usual pulleys at the upper end. Just below the pulleys there is a universal joint so as to permit tbe elevation or depression of the lower end of the table and belt. Near each end of this shaft are eccentric cams by which tbe side shake is imparted to the table carrying the rollers and belt. Near the lower end on the same shaft is a spiral cam, giving an end motion to tbe table toward the lower end, and an adjustable four-leaved spring throws the table hack. This end shake is susceptible of regulation wbile the machine is running, by moving the wheel controlling the spring. The spring regnlates the percussion, and a set-screw adjusts the cam to give more or less throw. In connection with tbis part of the mechanism, there is at the upper end a set of rubber bnffers fastened to the sliding face of tbe head of the bumper and there are side springs to check side motion. Tbis sliding bumper is independent of the main table, and is intended to relieve the friction when both side and end shake are used.

Tbe hand-wheel at tbe side of the lower end raises and lowers the upper part of the frame, carrying the table and belt to get the desired inclination of the belt. This can be done while the machine is in operation, and all wedges, etc., are dispensed with.

On the central longitudinal shaft under the table is a bevel gear wheel which operates a cone pulley, and this in turn, by means of a link chain, operates an oppositely set cone pulley. A sprocket wheel on the end of the sbaft of the upper pulley runs the large sprocket wbeel, sbown on the side of the machine, and a chain connected with the shaft of this large wheel turns the upper belt-roller and gives nothing to the belt. The object of this portion of the mechanism, is to admit of the side and end shake of the table and belt, and admit of regulating the speed of the belt without interfering with any of the other operating parts.

By suitably shifting the link chain connecting the two oppositely set corrngated cone pulleys, the speed of the belt, through this intermediate mechanism, is regulated while the machine is in motion.

On tbe end of the first or lower cone pulley-shaft is another sprocket wheel, and a chain leading from this gives motion to the revolving agitator in the feed-box. This feed-box is really an amalgamator being lined with amalgamated copper plates and having the blades of the revolving agitator similarly prepared. At the outlet where the pulp is spread on to the belt is an apron also provided with a silvered plate the clear water is delivered to the belt hy suitable pipes near the upper end of tbe belt.

The upper roller carrying the helt revolves in a trough inclined from both sides toward the center where there is a discharge hole through which the concentrates are carried off by gravity and led where most convenient. This discharge of sulphurets is continuous.

It will be noticed that there is no strain on tbe belt since it forms no part of the motive power, being run independently of the otber mechanism. The power being applied to the npper roller only, the belt need not be very tight but can run slack if desired. The bevel grooves on the rollers keep it in line, the edge ropes fitting snugly in these grooves. Tbe combination of motions and the percussion prevent tbe banking of sulphurets which in some machines cause trouble. Nor can the belt cause annoyance by running off.

The canvas belt will run eight or ten months, and only costs about $15 to renew. Rubber belts will be furnished to those who prefer them, but it is claimed that closer work can be done with tbe canvas. The various adjustments are qnickly applied, and it does not need a skilled expert to manage them. It is stated that with tbe application of the end percnssion the sulphurets will gain about eight inches on the length of the belt in its run.

Tbis machine has a daily capacity of about ten tons, and it is claimed by the manufacturers that it only takes a tenth of a horse power to operate one. This is due to the use of tbe steel balls and the peculiar mechanism. It can readily be put in motion by the application of the finger to the balance wheel on the main shaft, as was proven by trial. One man may attend to half a dozen of these concentrators. Sulphurets saved by this machine were sbown to tbe writer, wbich readily pass through a 200-mesh screen. Some results of the work of this concentrator on the ores of Igo, Shasta county, are given in our advertising columns. These particular ores have heretofore been found very difficult to concentrate, but in this instance a saving of 94½ per cent has been shown. A number of machines are now in course of construction at the sbops of the company in this city.

Foundry Notes.

In an interview with a representative of the Joshua Hendy Machine Works of No. 51 Fremont street, this city, we were informed that those works have recently furnished a complete stamp mill for the Kate Hayes Mining Company of French Corral, Nevada county, of which Mr. Henry Pichoir is the secretary; and as well a complete 20-stamp mill, with steam power, has been built for the Golden Cross Mining and Milling Company of Los Angeles, California, witb rock-breaker, Challenge ore-feeders, etc. Also a 10-stamp mill, complete in every particular, for the Mascot Mining Company, to be erected near Oroville, in Butte county, California. They have also furnished a large amount of Tee-rail for several mining companies and for other enterprises.

These works make a specialty of huilding the Davis horse-whims, ore-buckets and mining cars, and have furnished a large number of each during the last two months. Among other of the specialties they huild and furnish are hydraulic giants, water gates and all of the accessories of hydraulic mining plants, and it is to be noted that whilst the hydraulic miners of California are "backward in coming forward" in planning their future operations under the provisions of the Caminetti law of Congress and the Ford law passed hy the Legislature of our State, and that the "debris question" is atill an unsolved problem, that many orders for hydraulic mining plants are being received from British Columbia.

We are further informed that the demand for the Buffalo duplex steam-pumps, and as well for water-pipe for farm, dairy and irrigating purposes, has been good and tbat large quantities of pipe have been shipped.

INSURANCE AND MINING.—A dispatch from Salt Lake says: It has been discovered by a prominent mining man that insurance companies have decided to withdraw from the mining camps of the West. Representatives of all the insurance companies in Utah were seen here and admitted that nearly all companies were refusing to renew policies on mining property and in mining camps. The decline in the value of the properties on account of the silver panic is given as the cause.

IT is probable that the early assembling of Congress will interfere with the trip of the Senate sub-committee on commerce to the Pacific coast on the deep-water harbor project. Senator Ransom, chairman of the committee, says that he hardly thought he and his associates could make the trip this season. An engagement prevented an early departure, and now the coming together of Congress has seriously interfered with the plans of everybody connected with Congressional life.

EXTENSIVE preparations are being made for the California Midwinter Fair, and subscriptions are coming in fast enough to warrant the belief that it will be a success. A site for the buildings, etc., has been chosen in Golden Gate Park.

W. B. RISING, Professor of Chemistry at the University of California, has been appointed to serve as a judge in the Department of Chemical Industry at the World's Columbian Exposition.

WM. IRELAN JR., who was superintendent of the California mining exhibit at Chicago, has resigned the position, to accept that of judge in the Department of Mines and Mining.

SOME of the Salt Lake men are storing the silver ore they receive, charging only for loading and unloading. Nothing will be done with the ore for the present.

Coast Industrial Notes.

THE Virginia *Chronicle* says that owing to the continued drop in the price of silver, the mines of Gold Hill have been compelled to partially snspend operations.

ALL stationary engineers are requested to keep away from Hailey, Idaho, where trouble exists between owners of one of the largest mines in that locality and the pumpmen and engineers.

SALT WATER is now being furnished from the baths at the West End for street-sprinkling in the city of Alameda. It is expected that the city will save over $500 a month on this method of laying the dust.

SILVER MINING has been discontinued everywhere. As but few mines have been operating in Inyo county of late, Inyo will feel the depression less than many other sections. The stoppage of work, however, will he seriously felt.

THERE are several old Comstock miners from Virginia City working in the Jerome mines of Arizona, and they all agree that the Comstock, in its most palmy days, was not equal to the Jerome mines, either in richness or extent of ore deposits.

A PRIVATE LETTER received at Tuscarora from Silver City, Idaho, states that all the mines there, with bnt one exception, had shut down in consequence of the low price of silver. The crowd who left Tuscarora a week ago for that place in search of work, will be greatly disappointed.

THE total expense of maintaining tbe electric light plant in Alameda last year was $10,941. The question which has been agitating the citizens for some time has been settled by the City Trustee. The city will not sell the electric light plant, but will still maintain it as in the past.

THE entire water front at Mare Island will be dredged within the next few months. Twenty thousand dollars will be expended for this purpose. A mud-dredger is badly needed at the island and in the course of a few years would be made to pay for itself, besides being available at all times.

THERE has been no improvement noted during the past few days in the run of salmon on the Columbia. From estimates obtained from the most reliable sources the pack on the 1st of the present month was from 75,000 to 80,000 short. Ten of the canneries have run half-time during the past two weeks.

A NEW naphtha schooner, built for Ross & Hewlett, tbe commission merchants, will be launched from the ways in Alameda early next week. The new craft is sixty feet long, sixteen feet wide, and is expected tosteam faster than eight knots an hour. She will be placed in the dairy trade between this city and Fort Ross.

THE Usal Lumber Company, at Westport, having beretofore paid its employes in sight checks, have adopted, in conjunction with all the redwood mill owners in Mendocino county, the system of paying in 60-day sight orders drawn upon a San Francisco firm. Their employes objected to that method of payment and have all quietly walked out.

THERE is evidently a disposition to put new life into the San Mateo Electric Railway It is said to be a very paying road, but its management, it is claimed, has not been as effective as it should be. The creditors have held many meetings to discuss the best means whereby the company's debts may be liquidated and the park branch of the road completed.

THE Southern Pacific Company struck a big flow in an artesian well Tuesday at Indio, near the botel. The capacity of the well is 4000 gallons per hour, and the water rises ten feet above the surface of the ground. The water was found at a depth of 500 feet. This well can irrigate quite a large tract of land and the company is jubilant over its success.

ONE of the ways to restore confidence in financial circles in the United States is to open the hydraulic mines of California Not only would their yield of gold help to supply the lack of gold in the country, but it would be the cause of millions of dollars of foreign gold being sent to this country to be used in the development of mining property.—*Colfax Sentinel.*

THE order came to-day for a reduction of wages all around in the mines of the P. C. Co. The men have refused to accept the new scale and the Yuba night shift have quit. The proposed new scale is as follows: Carmen $2.25 per day, miners $2 50, timbermen and engineers $3. This affects about fifteen men, hut it is thought the day shift will follow suit.—*Pioche Lode.*

ARTICLES of incorporation of the Mount Vernon Water and Power Company have been filed in San Bernardino county. The incorporators are John L. Campbell, H. B. Muscott, C. W. Allen, E. E. Rowell and Hattie L. Campbell. The capital stock is $52,500. The object of the incorporation is to purchase water and water rights for manufacturing and domestic pnrposes.

THE public schoolhouse at Monterey, erected last year at a cost of $20,000, together with the fine library, was burnt to the ground last week. The fire was undoubtedly of incendiary origin. The insurance on the building and contents, amounting to $12,000, will hardly enable the school district to begin the erection of a new schoolhonse, and the loss sustained in the library is irreparable.

AT a large and enthusiastic mass meeting, held in the town of Anderson, the center of the fruit interests in Shasta county, a resolution was adopted agreeing to exhibit the products of this community at the mid-winter fair, to be held in San Francisco. It was also resolved to use the best efforts of this community to secure the exhibit of the united interests of Shasta county.

THE decline in silver has stagnated the ore market. Smelters decline to bid on ore, and are taking only what they are obliged to take under contracts. Quotations of any kind are nominal even for lead ores. The result is

mine owners are restricting production, or ceasing entirely. The camps are full of idle men, for whom there is no work at any price, and the financial pinch is felt over the entire State.—*Mining Industry.*

EVERY indication points to the prospect of there being considerable work during the next year at Mare Island Navy Yard. The Congressional delegation from California have made several visits to the yard recently, with the view of ascertainiog exactly what is required and to fully understand the requirements, so that when they go to Washington they will be in a position to explain what is needed. The various officers in charge of departments have accorded the delegation all the information possible.

ADVICES from Goff's on the Atlantic and Pacific road state that the contractors who are laying the track for the Nevada Southern from that point to Good Springs are rushing matters. The road is now running within five miles of Vanderbilt. The latest and most important information concerning the new road is that the contract for building fifty-one miles of new road between Vanderbilt and Good Springs will be let on the 20th inst. This indicates that the line is not to be a branch of the Santa Fe system, but an independent trans-continental line connecting Denver and southern California by way of San Bernardino. Some hold the opinion, however, that the road is to connect at Clover Valley junction, south of Pioche, Nev., to which point the road from Salt Lake now runs.

OVER in the Highland country, Montana, a large number of miners are engaged in prospecting for gold ores and every day from one to half a dozen men leave Butte for that section. The depreciation in the silver market has turned the attention of prospectors to gold and the Highland country is one of the most promising in the vicinity of Butte. The belief is very general that all the surface deposits of gold found on Silver Bow and Moose creeks were washed ages and ages since from rich quartz leads on the Highland. For twenty-five years the search for these rich leads has been prosecuted each year and although rich bunches of ore have been uncovered the prospectors believe that the mother lead has not yet been found. Prospecting can only be carried on in these mountains during July and August, on account of the depth of the snow.

THERE is a vast improvement in the present condition of affairs at the Mare Island Navy Yard as compared with last year or any previous year. In all departments there is great activity. In the steam engineering department there is a large force of machinists. Their labors are given to the construction of the triple expansion engines designed for the monitor Monadnock. In the joiners' shop also great activity could be seen were the doors open to the public, but secrecy reigns, for here upon the floor is drawn the deck specifications of the Monadnock. In the boat shops several boatbuilders are modeling and shaping the boats of the Monadnock. Here are employed the most skillful boatbuilders to be found, as has been evidenced by the record of the boats of the San Francisco. In this shop were found six boats under construction, while there were many others completed. At the smitheries and shipfitting machine shops fully 200 skilled machinists are at work. A visit was made to the Monadnock, which lies at the quay wall, for the purpose of inspecting her interior. The boilers are all in place and the connections are made. The fireroom is practically ready for service.

AT A MEETING of the San Francisco Clearing-house held recently the following preamble and resolution were unanimously adopted and ordered printed, to be distributed to all concerned:

WHEREAS, It is universally admitted that the allowance of overdrafts of banks is an unwise system of banking as compared with the more conservative system which enables the banker to retain control of his resources at all times, and whereas the banks of this association did on July 6, 1893, unite in a written agreement to abandon the allowance of current overdraft accounts at bank; therefore

Resolved, By the San Francisco Clearing-house that the banks of this association will, in accordance with their said agreement, annul all overdraft privileges and promptly notify their customers that overdrafts will not be allowed, and also that the Clearing-house banks will in all fairness support each other in carrying out this resolution in letter and in spirit.

Attest: J. S. HUTCHINSON, Sec.

The following banks compose the San Francisco Clearing-house: The Bank of California, the Bank of British Columbia, the Donohoe-Kelly Banking Company, the First National Bank of San Francisco, London and San Francisco Bank (Limited), Sather Banking Company, the Anglo-California Bank (Limited), Wells, Fargo & Co., the Nevada Bank of San Francisco, London, Paris and American Bank (Limited), Tallant Banking Company, the Crocker-Woolworth National Bank, Grangers' Bank of California, American Bank and Trust Company, Bank of Sisson, Crocker & Co.

J. McKee, president of the San Francisco Clearing-house, in reply to a question, said: "The system of overdrafts is allowed in no other commercial center of the world. It is an unsafe way of doing business, as it does not allow a banker to keep control of his resources, and it is better for customer and banker alike that the system should be abandoned. The agreement of the Clearing-house is, in my mind, the most important step it had taken since its commencement. In future under the new arrangement all business accommodations at a bank must be preceded by negotiations for the amount needed."

Coinage Charges for Silver and Gold.

TO THE EDITOR:—Was gold coined by the United States with a charge for coinage previous to 1873? If so, what charge?

Was silver coined by the United States previous to 1873 with charge for coinage? Very respectfully,

Durango, Col., June 27, 1893. SUBSCRIBER.

[The coinage charge for gold from 1853 to 1871 was one-half of one per cent. From 1871 to 1873 it was one-fifth of one per cent. Since 1873 there has been no coinage charge.

From 1792 to 1853 there was no coinage charge for silver. From 1853 to 1873 there was a coinage charge imposed.—EDITOR.]

Not a "Kid-Glove" Miner.

TO THE EDITOR:—In the Marysville *Democrat* of the 26th of June, 1893, was an editorial which had for its headline "NOT CORRECTLY STATED," and that was true. The editor's criticisms are not "*not correctly stated.*" The interview with me printed in the San Francisco *Call*, to which he alludes, was a statement of facts, no matter if these facts were displeasing to the *Democrat;* but as I am only a "clerk," I will not attempt an argument with an editor of a daily journal.

I have the honor to be the Secretary of the California Miners' Association, having served in that position for two years, and confess that I feel very proud of being chosen by such an assemblage of whole-souled, open-hearted, liberal-minded men as the miners of California who attended both of the conventions in this city. The gentleman says in his article that I am a "kid-glove miner." That may be so according to his ideas; but if swinging a single-hand hammer, polishing the head of a drill, piping in a hydraulic pit, sharpening drills, afterwards acting as foreman and later on as superintendent of a mine for nine years, makes one a "kid-glove miner," will you kindly tell me what constitutes any other kind of a miner?

That I am "one of the class of men who have done the miners more harm than benefit," I emphatically deny. It has been my earnest endeavor to assist in an humble way in the solution of the problem of permitting the hydraulic mines to resume work without materially damaging the navigable streams. My labors may have resulted in no great good; but that I have done the miners of California any harm I deny and will not so believe until the miners themselves tell me so. Nine years ago I published a weekly paper called the *Mining and Industrial Advocate.* Hon. E. G. Waite, the present Secretary of State, was my editor. Its purpose was to promote the mining industry of the State. The money spent by me in that venture was certainly not with a view to "harming the miners of California," nor was the time lost anything to my advantage. The gentleman states in his article that I do not know what I am saying. Incompetence is scarcely a subject for discussion in this instance, for I am only a "clerk" and the gentleman is an editor with a daily paper at his command. He has a perfect right to think of me as he pleases in regard to knowledge and I will gracefully submit, for if a man is drawn into a controversy with everyone who considers him wanting in ability, he will have a never-ending war of words.

Some statements made by me I know do not meet with the approval of the Anti-Debris Association or of its ally, the *Democrat*, but that is immaterial to me. The miners have been a law-abiding set of men. They have stood more than any other class of men in the world would under similar conditions. They bought their land in good faith from the United States Government, and I contend are entitled to more consideration than they have received in the past ten years.

My father was a miner. He made his money mining in California and Nevada, and he raised his sons to become miners. I am happy and proud to say that to-morrow I could go underground with the boys and put in a good 10-hour shift. Some of the happiest years of my life were spent in mining camps in Placer county. Mining has been my business and will continue to be for the rest of my life. I look upon miners as men full of courage, warm-hearted, liberal to a fault, and true friends. They have been my friends, and I will ever try to repay them in my humble way for the kindness they have shown me.

Yours respectfully, W. C. RALSTON.

San Francisco, July 12, 1893.

Mines Around San Bernardino Mountain.

TO THE EDITOR:—I have lately been visiting the mines in and about San Bernardino mountain and find considerable activity. The old Gold Mountain (Lucky Baldwin) mines have been bonded by Budd Doble and associates, and a company is being formed to be called The Budd Doble Gold Milling and Mining Co.

It was a well understood fact that the quantity of ore and the values were in those mines. It appears that Doble has for years past been testing these ores in Denver, Chicago, and other mining centers and always found the assays satisfactory, but never until lately could he find proper treatment for saving the gold. Hearing of the new patent amalgamator of T. J. Lovett's, of Chicago, the machinery of which is manufactured by The Gates Iron Works, Doble and associates had Mr. Lovett visit the property and after satisfying himself as to the quantity and quality of the ores, had a few tons shipped to Chicago for a practical test. The new machinery saved 90 per cent—this being highly satisfactory—and to further assure themselves they had a couple of mills put up on the ground. One of the mills has been in operation for over a month and the mines have been opened up where there is a mountain of ore, if I can use such a term. A face 40 feet in width by about the same in height is now in full view where they have taken the ore from to test the property. I have seen the results of several assays of tailings and in no instance do they exceed $1 per ton. This is extremely satisfactory and the result of the clean-up is more surprising. Your correspondent has been allowed, through the courtesy of Mr. Lovett and Mr. Jenks, the metallurgist, to be present during the time they have been cleaning up and smelting. I give you the exact figures, which will no doubt surprise some of the old Gold Mountain Co. stockholders and especially Lucky Baldwin himself.

The ore taken from the face of the 40 feet assayed $10 per ton, and the actual bullion saved was $9.10. This is highly satisfactory, and Mr. Lovett will soon go East for the purpose of putting in a large plant.

The Rose mine, in Morongo district, about six miles east of the Gold mountain, is still running the five-stamp mill with success, and the company (being composed principally of orange-growers in Riverside) is also shipping some of the rich ores to the smelter. This mine has been running some two years with remarkable success. The ore is high grade, being about $50 per ton, and the shipping ore over $300 per ton. The mill process will save only a small percentage of the higher grade—in fact, they do not save over 60 per cent of any of the ore. Mr. Wood, formerly of Tombstone, is now in charge. The last ore-body has been struck on the 350-foot level, and it is the largest body yet found. If this mine was up north there would be a great deal more heard about it.

The Holcomb Valley Co. is putting in new machinery on its placer ground. Mr. W. E. Pedley, the superintendent, believes he has now surmounted the difficulty of working the ground. The gravel is rich enough, but the natural fall of the ground is not sufficient for sluicing or hydraulicking, so he is putting up expensive dredging machinery, with a view of getting sufficient fall for sluicing. The works are expected to be in operation in a few weeks.

C. W. Allen, of San Bernardino, is working several men on the Livingston mine. Some old works have been cleaned out to the depth of 200 feet, where he expects to work the mine from. Some very rich ore has been struck lately, and by cross-cutting from the bottom of the old shaft they expect to strike it at that depth. This claim is about five miles southeast from the Rose, in the main belt. A number of prospects in Rattlesnake canyon, in the same neighborhood, give promises of value.

This country (Bear valley) as a summer resort cannot be surpassed. There are two lakes, one five miles in length, which supply Redlands and surrounding country with their irrigating water. This is a most picturesque sheet of water, the tall pines surrounding it on all sides. There are lovely drives, good fishing and hunting, and the best of accommodation. The stage runs twice a week from San Bernardino to Knight's hotel, in Bear valley. MORE ANON.

Pine Lake, San Bernardino Co., July 10, 1893.

The Mining Bureau Museum.

The following are among the recent additions to the mineral collection of the California State Mining Bureau:

Galena Crystals in fossil oyster shell—Leadville, Colorado; from J. Z. Davis.

Gold in Hematite—Our Flag Mine, Calaveres Co., Cal.; T. H. McArdle.

Tantalite and Columbite—King's Creek District, Fresno Co., Cal.; R. Reynolds,

Boleite—Boleo, Lower Cal.; from the Compañia del Boleo and from Dr. Hoerdell.

Josephinite—Josephine Co., Oregon; from Jas. H. Scott, Judge W. K. Hanna and Will Q. Brown.

Auriferous Blue Gravel—showing free gold from a channel near Yreka, Siskiyou Co., Cal.; C. B. Gilson.

Suite of Ores from the Boleo Copper Mines, Lower California; from the Compañia del Boleo.

Stibnite—Caliente, Kern Co., Cal.; Sumner & Brown.

Gold Quartz—Reed Con. Mine, Shasta Co., Cal, assaying $522.00 gold and 25 oz. silver per ton; R. Stevenson, manager.

Fine Specimens of Native Copper, Feldspar, Crystals, Topaz, etc.; from the Geological Survey of Japan.

Tellurium, Tellurides, Silver Minerals and a variety of Silicates; from the School of Mines, Golden, Colorado.

Zaratite—Madera, Fresno Co., Cal.; James Brusie.

Platinum and Platiniferous Earths, from the Demidoff Estate, Nijoi, Ural Mountains, Russia; from Mr. Geo. F. Kunz.

Green Tourmaline—Auburn, Maine.

Gold Quartz—Gold Bronze Mine, Vanderbilt District, San Bernardino Co., Cal. Assays 15 ounces gold and 60 ounces silver per ton; from Messrs. Faggart & Hall.

Silver Ore with Bismuth, Gold, Copper, Zinc and Antimony; Mariposa Mine, Sinaloa, Mexico; H. W. Faust.

Silver Ore—Very rich, with Embolite and Ceraragyrite in crystals. Fame Mine, Globe District, Arizona; Alfred Haustein.

"Peacock Copper Ore"—500 foot level of the Union Mine, Copperopolis, Calaveras Co., Cal.; G. McM. Ross, manager.

Crystalized Gold—Dry Gulch Mine, El Dorado Co., Cal.; J. J. Crawford.

Atacamite, Proustite, Ruby, Silver, Etc.—Six Specimens, Chile: from the Sociedad Nacional de Mineria de Chile, per C. T. Ward, Jr.

Cosaltite—Candameña, Chihuahua, Mexico; Ross E. Browne.

Cobalite—Alta, Placer Co., Cal.; W. F. Drew.

Native Lead—Red Elephant Mine, Idaho; Geo. Garbutt.

Gold Quartz with free gold—From the famous Drum Lummon Mine, Montana; Geo. Garbutt.

Cinnabar—McCarthy Mine, Sao Francisco City.

Gold in Calcite—E. D. M. Mine, Quartz Valley, Siskiyou Co.; A. G. Myers.

Danaite—Josephine Mine, Mariposa Co., Cal. A number of specimens of gold quartz from mines in Mariposa County, not previously represented in the Bureau collection.

Natural Coke—Pagosa Springs, Archuleta Co., Colorado; E. M. Railton.

And a large number of other specimens, models, views, etc., of interest.

Pocket Mining.

NUMBER II.

TO THE EDITOR:—A pocket, as stated in the first article upon this subject, is a concentrated body of gold, silver or other valuable mineral occurring in certain spots in ledges, lodes, veins, etc., of quartz and mineral-bearing rock. Gold pockets, upon which this series of articles is written exclusively, occur only in quartz or where quartz is present, for it is now known to be a proven fact that without quartz being present in some form gold does not exist in its original lodging place, where it has been precipitated from solution, or, in other words, congealed or transformed from a liquid state to a solid metallic state. Minerals exist in three physical conditions, viz., solid, liquid and gaseous. It is well said that "quartz is the mother gold," for it is always found with the gold. The gold is carried with the mineral quartz—for quartz is a mineral—in solution into cracks or fissures formed from various causes in the earth's crust, and there the solution becomes solidified from some peculiar action of nature and becomes what we term a ledge or vein. Now the question naturally arises, where does this mineral solution which comes in and forms veins in those cracks or fissures originate or come from? It comes from the formation or earth in which they are diffused, in the vicinity of where the mineral-bearing vein is formed. Those minerals being distributed throughout the formation in which they exist, are liberated gradually, mostly in a gaseous form, and are taken up by the water and transformed into solution and carried to those cracks and fissures and other lodging places, where they again undergo a change and are transformed into a solid state and form our mineral bearing veins or deposits. In nearly all the districts on this coast the mineral-bearing veins or ledges that run parallel with the formation of the country rock are almost invariably what is commonly called milling ledges, because they carry about the same amount of mineral all through the pay chutes, while on the contrary all the ledges that run crosswise of or cut the formation are pocket ledges. The pocket belts, or streaks of formation which are prolific in pockets, are mostly porphyry or of a porphyritic or quartz-porphyry nature running parallel with the slate, granite, lime, etc., and are readily detected by the professional and experienced prospector owing to the chemical and mineral composition and general appearance to the eye. This pockety formation does not always exist in belts, but sometimes occurs in spots or patches throughout the mineral belts of the coast. In fact, there is hardly a mineral district west of the Rockies in which those spots do not occur. The chemical or mineral composition of this pocket formation is generally silica, lime, soda, alumina, potash, copper, lead, magnesia, iron, gold, quartz and water, although these conditions differ in each locality. What forms the pocket, or, in other words, what causes the gold to concentrate in a small space at certain points, is owing to a peculiar combination of other minerals which exist at or near that point and form a magnet, as it were, and some of the minerals in this peculiar combination having an affinity for each other naturally concentrate and in turn combine to form an affinity or attraction for the others contained in the same formation, and so on until the combination is complete and possesses the affinity for the gold, quartz and other lateral properties. What those minerals are and how to detect them, and a thorough explanation of my theories and the *facts* upon which they are based, will be given in future articles of this series. Pockets occur in three distinct and different conditions, viz., decomposed or free pockets, intact or specimen-rock pockets and pay-chute pockets, and they each form from separate causes and under different conditions.

The first, decomposed or free pockets, occur upon ledges, seams, feeders, etc., and are generally near the surface and throw out a strong trace, and as a rule are easily found. Those pockets are generally small compared with the specimen-rock or intact pockets and rarely exceed over $2000. At the point where the pocket occurs in the ledge or seam the combination of minerals at that point decomposes the ledge and leaves the gold free so that it can be panned out, and often it is so well freed from the quartz, iron and other minerals that it does not require crushing in a mortar to make it salable as free dust. In this class of pockets there is always another cross seam or ledge which cuts, crosses or comes in contact with the ledge or seam at the point where the pocket occurs.

This cross or contact ledge or seam always carries or is entirely composed of a different mineral from that which predominates in the ledge which contains the pocket and is often very small, sometimes not more than a fourth of an inch in thickness. This ledge or seam which is composed of or carries the mineral that is required to complete the combination which decomposes the ledge at the pockets and causes the pocket to form at the point where it comes in contact, always runs at an angle to the general course of the main ledge. There is always a feeder or loose place from the pockets of this class to the surface of the ground somewhat resembling an old gopher or squirrel hole which has settled or caved in, and through this aperture or feeder the gold is forced out to the surface of the ground by the action of gas generated in the pocket; or the gold is forced from the pocket in a gaseous form and becomes condensed as it passes through this opening or feeder and when it comes in contact with the atmosphere. By either action it reaches the surface of the ground, and by its specific gravity it naturally works down hill. There are invariably two of those feeders or "spire holes," as the pocket hunters call them, one leading up and the other down the hill in a curving course from the pocket to the surface. This accounts for gold being often found plentifully as much as 25 feet and over above the pocket, when it occurs on hillsides, which very often misleads the prospector and causes him to pass over the pocket and miss it entirely.

The trace from a free or decomposed pocket is always on the top of the ground, in the grass roots as it is termed, and rarely if ever is found down any depth in the soil unless it be of a very loose nature so that the gold can readily sink down into it. But if the soil be firm and compact and the hill or mountain side steep, the biggest prospect will be obtained by scraping the loose dirt and gravel on top down, say an inch, to where the ground is hard and compact, for very little of the gold will work down into the solid ground if it has any chance at all to work down hill. I have panned on traces where other prospectors, who were in the habit of going down to bedrock for their dirt to pan, had worked, and where they could not raise a color on bedrock where the soil was not more than 14 inches deep, I have got as high as 25 cents to the panful taking the loose dirt on top of the ground.

It may be well to explain what a pocket trace is, for the benefit of the novice and those who are inexperienced. A pocket trace is the gold and other minerals which are liberated or forced out from the pocket and by their specific gravity gradually work down hill, naturally spreading out over the surface more or less in its downward course, until it finds its level or works into some gulch or ravine. In the case of pockets of this class which have been capped over by slides and locked up, as it were, from longer giving a trace, or where a great space of time has elapsed since the gaseous action ceased to throw out the gold from the pocket, the gold in the course of time works down into the soil and finally reaches bedrock. But in the majority of cases the gold and the mineral that comes with it from the pocket are in the surface dirt.

I invite the criticism of *practical* experts on this subject whose theories, views and experience differ from mine, so that the different theories and views expressed upon this most important branch of mining may result to the general good of all the miners and prospectors on the coast, and especially to the readers of the MINING AND SCIENTIFIC PRESS.

ALEX QUARTZ.

Of Hydraulic Mining.

TO THE EDITOR:—The present condition of this great industry is lamentable. A few years ago we saw a steady stream of ten or twelve million dollars in gold pouring into the coffers of the mine-owners. Now, what do we see? Mines shut down, rivers choked and valleys overflowed! And yet the State has need of every ounce of gold that can be procured, and the tule lands need all the slickens the mines can make. It is simply a case of matter in the wrong place. In the river, nature has provided a flume by which to convey the slickens to the tules. All that is needed is to take the slickens out of the river and dump it where required. There is a dredge now at work in England which can get away with 4000 tons an hour. Let the hydraulic miners combine and set half a dozen such dredgers at work in the Sacramento river. Within six months the mines will be running and the miners will be accounted the best friends of the farmers. Moreover, at present quotations for silver, gold is worth double what it was 20 years ago.

"VERB SAP."

San Francisco, July 10, 1893.

GOLD IN A SWAMP.—The latest gold reefing discovery is at Euahalong, on the Lachlan, New South Wales. One of the owners of the station, plowing in a mulga swamp, with the view to forming a furrow in which to lay poisoned wheat for rabbits, turned up a block of quartz. Curiosity made him pick it up, and he saw gold in it. The whole of the flat was covered with alluvial deposit, and the owner decided, when he had leisure, to sink beneath where he turned up the quartz, though there was not the faintest indication of an outcrop. After sinking about four feet through the alluvium he came on to a body of quartz four feet wide. A shaft has now been sunk to 82 feet. The reef has been proved at 30 feet and at 50 feet, crushings of five tons from the former level going 5½ oz., and at 50 feet 1 oz. 11 dwt. A drive is now being put in to cut the reef at 82 feet. The discovery is one of those accidents which beat fiction.

LAKE SUPERIOR MINES.—A suspension of work has been ordered at some of the Lake Superior mines, among them the big Norrie mine which has been working a half force of 650 men. These have been let off, and other mines around Ishpeming have ceased operations for a time, and additional ones will close at the end of this week. The unfavorable outlook in the ore business in regard to prices is the cause of the shut-down. Large stocks are on hand, and shipments will be made from these.—American Manufacturer, June 30th.

A SLIDING SCALE.—The mining outlook in the silver camps on the Wood river, Idaho, is very dull. Two or three of the principal mines are still working under a sliding scale of wages. The Red Elephant has an agreement with the men by which they are to receive $3.50 a day when silver is 85 cents or over, $3 when between 80 and 85 cents, $2.50 when the price is between 70 and 80 cents, and $2 when between 50 and 70 cents. Should silver fall below 50 cents, the mines are to be closed down. The Red Cloud has a similar arrangement with the miners.

THE Highland Irrigation Company has completed a reservoir ten miles from San Diego with a capacity of 1,500,000 gallons, which will be filled by a pump having a capacity of 1,000,000 gallons daily. Upward of 2000 acres of land will be irrigated and pipes are now being laid. The company will soon build another reservoir a few miles from the present one, with a larger capacity, to irrigate 3500 acres more.

NEAR the new stone drydock at Mare Island Navy Yard excavations are being made for foundations for the new benching rolls. From appearance the beds will be of sufficient strength to bear the greatest weights that they can ever be subjected to. Buildings will soon be erected over them.

A Gold Shipment.

The Mechanical Operations of Packing and Exporting the Coin.

When a foreign banking house announces that it will ship $1,000,000 in gold to Europe, the mechanical operation of making the shipment is interesting. The house reaches its conclusion to ship after finding that it has sold its own bills of credit to importers of goods to such an extent that it cannot buy enough bills from exporters of merchandise, etc., to cover the amount paid out by it to the importers.

At the present time a banking house will pay exporters of merchandise as high as $4.89 to the pound sterling for a demand bill of exchange on London; but to pay any higher price is not as profitable as to ship gold. That condition exists at the present time. Not being able to get the bills wanted at $4.89 to the pound sterling, the house decides to ship gold.

The questions to be decided now are how to get the gold and how to get it to its destination securely. First of all, the house sends its manager to its bank and informs it of the contemplated shipment of gold, so as to prepare it for so large a payment. The house then deposits with the bank checks to the amount of $1,000,000, which it has received from importers in the transaction of business over the counter. These checks the bank sends to the clearing house for collection. The clearing house collects the money from the different banks upon which the checks are drawn.

It is important to notice that the money which the clearing house takes at the present time from banks is principally greenbacks, gold certificates, treasury notes of 1890 and national bank notes. There is more or less discrimination against silver certificates because these are not legal tenders.

The bank which is to furnish the money for the exporter of gold notifies the clearing house to pay it such bills as will be received by the sub-treasury in exchange for gold. The bank adopts this means of getting the gold for its customer rather than to give it directly from its vaults. At the present time the bank in question wants gold certificates and legal tenders, because this form of currency is the surest to get the gold from the sub-treasury, owing to the fact that the Government stock of gold is reduced to a point where more or less discrimination must be exercised in regard to the different forms of currency taken in exchange for gold.

The clearing house, in answer to the bank's request, tries to accommodate it with the currency it wants, but cannot go beyond a certain point in favoring it, because all the other banks in the clearing house may desire equal accommodations, although this at present is not strictly the case. At any rate, the bank gets a large proportion of greenbacks, say 60 per cent, the balance being given in treasury notes of 1890, and perhaps a very few gold certificates.

After the bank has received this money from the clearing house it notifies its customer, the foreign banking house, that it has the money on hand subject to its order. The house then sends its clerk to the bank with an attendant and a large valise, and gets from the bank the million dollars in the forms of currency indicated. This clerk and his attendant return with this money to their house, where it is recounted. Afterward the manager of the house with an attendant, as a safeguard, takes this money in a valise to the sub-treasury and presents it to the cashier, stating that it is his wish to get $1,000,000 in gold coin in exchange for this paper money for export.

The cashier of the sub-treasury receives the money, and again it is counted. The cashier on finding the counting correct looks over the different kinds of coins in store, and gives the house a certain proportion of the double eagles, eagles and half eagles, according to the amount of each kind held by the sub-treasury. The house must know approximately, before it decides to ship, just what kinds of coin will be given, because the smaller the coin the greater the abrasion in handling it, and that must be taken into account in estimating the expense.

Therefore, while the employees at the sub-treasury are counting the money deposited by the house, the manager of the house receives from the cashier of the sub-treasury an exact statement of the kind of gold he can give and what he can do in preparing it for shipment. Assuming that the estimated loss from probable abrasion and expense of packing, etc., can be afforded, the house orders $1,000,000 of the coins to be put up for shipment. The sub-treasury then puts the coin in canvas bags, each holding $5000, and puts these bags in kegs, each keg containing $50,000, and each keg tightly fastened. For this, of course, the sub-treasury makes a small charge.

When the kegs are ready the house sends a duly authorized drayman to take the gold to the steamer. During this time also the house consults the insurance company about insuring the gold while on passage. The whole time occupied from the point of deciding to ship to the actual placing of the gold on board the steamer is about 40 hours, sometimes more, sometime less, according to the trouble involved in getting the proper currency from the bank, and the difficulties attending getting the gold from the sub-treasury. The various expenses of insurance, cartage, packing and freight amount to about one-fourth of one per cent.

While these details may seem insignificant and mechanical, there is, nevertheless, at each step an important risk involved, and the greatest care must be exercised in counting and calculating, and great confidence must be reposed in those to whom the task of executing these details is given.

Of course, the main point in a gold shipment is to determine the principal factors in the first place which will make the probable shipment a profitable one. These lie outside of the mechanical operations already enumerated. These factors include on a gold shipment to London, the rate of sterling exchange here, the discount rate in Lon-

dnn, the money rate here, and the weight of the gold. The mnney rates are important, because of the time the house must be without the money while it is on the ocean.

At present the gold shipped goes to Bremen and from there to Vienna. In this transaction not only the rate of sterling exchange on London must be known here, but also Paris, Vienna and Berlin. The banking house here, as a rule, depends upon its foreign house in Vlenna to figure out the profit on the gold shipment, because in Vlenna the banker is in better position to watch the various exchanges on London. The New York banker finds it too complicated, owing to rapidly changing conditions in the different cities of Europe, to figure with certainty.

To figure the profit on a shipment of $1,000,000 from New York to London is comparatively easy, and can be done by the New York banker. Previous to the present shipments the gold has been exported mostly to Paris. Even this shipment is a complicated one, so far as figuring out the profits is concerned, because of the different rates of exchange and the different money markets which must be consulted; but it can be done by bankers on this side in conjunction with their London and Paris correspondents.—New York Independent.

NEW MILITARY DEPARTMENT.—The President has signed an order reorganizing the Military Department of Arizona under the name of the Department of Colorado, with headquarters at Denver. The Department of Arizona consisted of the Territories of New Mexico and Arizona and that portion of California south of the 35th parallel. The new order abolishes the Department of Arizona and places Arizona, New Mexico, Utah and Colorado in the new department. California is restored to the Department of California, with headquarters at San Francisco. The headquarters of the Department of Arlzona were at Los Angeles, placing General McCook, commanding, at the extreme western part of his department. This caused great delay in communicating with army headquarters at Washington, as all matters in his section were sent to him, and by him to Washington. With the headquarters at Denver, he will be at the extreme east of the department and in the closest communication with Washington. This, it is believed, will effect economy in time and money and greatly facilitate the disbursement of supplies and ammunition. The move is not at all liked at Los Angeles, however, since it is worth a great deal to a town or city to have the headquarters of a military department established within its limits. A vast quantity of supplies are bought at headquarters for the use of the troops serving in the department. Forage, fuel, flour, pork, bacon, beans and many other articles are purchased annually, and the local contractors, bankers and commission merchants are very much benefited by having so good a cash customer as Uncle Sam at their own doors. It will not make much difference to San Francisco, which is certain to always be the headquarters of not only a department, but also a division. The recent change was made with a view of correcting the absurdity of having two army departments within the boundaries of one State. The Department of California, under the new arrangement, consists of the whole State, wlth Nevada thrown in.

ON July 1st the Denver, Salt Lake and San Francisco Railroad Company was incorporated under the laws of Colorado. It is capitalized at $10,000,000. It has for a prime mover and chief promoter Governor John Evans, president of the first railway ever built into Denver, who also organized and constructed the Denver, South Park and Pacific road, and the Denver, Fort Worth and Gulf railway. Most of the directors of the new company were interested with the Governor in the ventures named, and, all told, it is safe to say that they are worth $50,000,000. It is the intention of the company to at once put a corps of engineers in the field, and, when a most feasible route has been determined upon, commence work building the road.

THE naval reserves, when an opportunity occurs, will exercise at sea. It is not the desire of the Navy Department to follow the practice of drilling the men of the naval militia on shore and ships in the vicinity of their homes. It is believed that a better opportunity will be afforded the men to familiarize themselves with practical seamanship by sending them out of sight of land. As soon as a proper ship can be spared the reserves at San Francisco will probably be given an opportunity of sea life and drill.

GEORGE W. STARR, who for the past three or four years has been the efficient superintendent of the Empire mine of Grass Valley, has tendered his resignation to the Empire Company to take effect at once. Mr. Starr has accepted a position under John Hays Hammond to go to the rich gold fields of Johanneshurg in South Africa as superintendent of one or more of the big mines in that district, and expects to leave on the first of August. Mr. Fred De Crano will go to Africa at the same time.

TO DEVELOP SOUTHERN MINES.—Captain W. R. Perriman, representing the Ibarra Gold Mining Company, has chartered the schooner Amethyst to take a cargo of mining implements and machinery from San Francisco to Santo Domingo for the Ibarra mines. The vessel will load at once and clear for Ensenada. San Francisco purchasers of the Ibarra gold property are preparing to develop it on a large scale. They have plenty of cash, and competent men have been secured to handle it.

THE Mammoth mine in Pinal county, 50 miles from Tucson, A. T., has shut down. The Mammoth was a gold mine and belongs to a syndicate in London, England. It is believed that the suspension is only temporary. The yield for the past few months has been very low.

THE mill at Needles is receiving ore from both Vanderbilt and New York districts. There is talk of building a smelter at the Needles.

The Art of Mining by Fire.

In olden times, before the lnvention or common use of explosives, the best method available for mining through the hardest kind of rock, such as resisted the use of hammer and wedge, was by means of fire. Nothing is more natural than that the effect of fire on rocks should have been known at a very early period; no one who has lighted a fire on rock can help noticing the rending effect of the heat. The same thing would he seen after any natural forest fire; several examples on a very extensive scale have recently come under the writer's notice in Australia where bush fires of great extent are frequent, and all the rock cropping out at surface ls seen to be cracked and split over great areas. The great trouble with fire-setting seems always to have been the heat and smoke produced—the latter being often strongly snlphurous, where the ore contained pyrites or other sulphides. It is easy to see that this would have been a great obstacle, where the means of artificial ventilation were so imperfectly understood; but it applies far less at the present day. Indeed, by a proper system of ventilation with upcast and downcast shafts, it need be no more objectionable than the ventilating furnaces still used in some collieries; and at Kongsberg silver mine in Norway, the system is still used occasionally for drivlng levels, mainly on account of the great improvement in ventilation which it causes throughout the mine.

The writer has recently had an opportunity nf seeing the process at work in this mine, and as it is perhaps the only place of importance in Europe where it still survives, a few details of the mode of working may be of interest. The process is now confined to the occasional driving of levels in hard siliceous gneiss—it having been found that the micaschist and other micaceous rocks, which also occur at Kongsberg, are far less favorable for fire-setting. A short piece of level is driven at first in the ordinary manner, to get room to start the process; and wood—mainly logs of white fir and red pine, dry and split—is closely piled up so that the fire plays against the "face;" waste wood or old timbers from the mine being often piled against the freer-burning fir, to concentrate the heat. When the pile is lit smoke fills the level, and the men leave it, but in two or three hours it is generally burnt out, and as soon as the men can come in the broken stone which is split off is cleared away, and all that is sufficiently loose is broken down. The fire sets stronger on the roof and sides than on the sole, so that the levels have a constant tendency to slope upwards. This can partly be prevented by better arrangement of the fuel, putting long pieces at the bottom and covering the upper part; bnt sometlmes the sole has to be blasted. The ordinary speed of driving is from 5 feet to 20 feet per month. Prof. Helland states that fire-setting kept its place as the common method at Kongsberg so long as double-handed boring, iron borers, and powder were used; but that on the introduction of single-handed boring steel borers and dynamite or other high explosives, the use of the old method rapidly died out.

In 1864 fire-setting was both cheaper and quicker than the old method nf blasting with powder in large holes; but on the introduction of dynamite and small holes, things were entirely reversed; not only did the new method effect a great saving in time and cost, but fire-setting became actually dearer than before, owing to the increasing wages. It should be added that at Kongsburg suitable wood is very cheap—an important point, when it is remembered that about nine parts (by volume) of wood are required to one part of rock, and that much less skilled labor is employed for the fire-setting—as is indeed shown by the rate of wages paid. There seems to be little reason to believe that fire-setting is very unhealthy for the men employed, when care is taken to ensure efficient ventilation. No doubt the great heat developed is prejudicial; but perhaps not more so than the dynamite smoke, the constant jar to system ln heating the drill, and the fine sharp dust often inhaled, incidental to the more modern process.

Attempts have been made at various times to improve the fire-setting method, by using turf at the Rammelsberg mines in the Harz, and brown coal in the tln stock works at Altenberg; but neither was successful. Better results were obtained with coke at the St. Cristoph mine near Breitenbrunn in Saxony. At Felsobanya, in Hungary, the method is improved by the firewood being held in an iron framework on legs or wheels ("pregelkatze"), which concentrates the fire and improves the draught. According to Serlo, Hugon has used a small furnace, mounted on wheels, supplied with a blast to urge the flame direct on to the rock, at the Challenges mine in France. Burning small coals, this apparatus in 55 hours drove an end four feet wide and six feet high a distance of five feet; whilst two men with the usual explosives would only drive the same end from five to six and one-half feet in a month. If this were done at a reasonable cost, it would be a very fine result, but as to relative economy Serlo gives no particulars.

As to the possible future of the fire-setting method, it is unlikely that it will ever again come into use to any important extent; for, although it could hold its own under suitable conditions against blasting with powder, yet the modern improvement in high explosives and boring machinery, which have deprived miniog through the hardest rock of all its terrors, have done away with any necessity for the old process. Yet, in exceptional cases, where machinery and skilled labor are not available, fuel cheap, and the rock very hard and siliceous—conditions which occasionally confront the mining engineer in semi-civilized countries—it would be worth while to reconsider its many advantages.—Abstract of a paper read before the Federated Institution of Mining Engineers, by Arthur L. Collins.

Cement Lining in an Irrigation Canal.

The Gage canal, at Riverside, in southern California, is 22 miles long and is used for irrigating orange groves, vineyards, etc. This canal has been in use for 12 years. It was found several years ago that a great deal of water escaped by reason of gophers burrowlng in under the canal, thereby injuring the canal to such an extent that it was found absolutely necessary tn devise some means of preventing the enormous waste of water. It was finally decided to re-grade and cement the whole canal, and the contract for doing this work was awarded tn the Gray Bros., of San Francisco and Los Angeles, for about $120,000.

The cement was spread one and one-half inches thick on the banks and mixed one part cement to four parts fine, sharp sand. At times more than 300 men were employed on this work, as it only could be done during the rainy season when the water was not wanted for irrigating purposes. The first section of this work has been done nnw for about two years, and the cement holds perfectly good. Where heavy fills of earth were made, about eight inches of masonry were used. It has been found that since this work has been finished the water company has received more than twice the amount of water obtained from the uncemented canal, thus showing that friction, evaporation and loss of water by leakage were more than 50 per cent. This is supposed to be the longest irrigating canal known that is cemented throughout.—Engineering News.

Death in the Milk.

We have so often commented upon the utter uselessness and folly of dwellers in San Francisco and her suburban belongings partaking of unclean and dangerous milk, that we fear our readers will consider us afflicted with a sort of lacto-phobia. If, however, our suggestions and exhortations had been heeded, there would have arisen no occasion to repeat them, accentuated as they now are by a most grievous and fatal epidemic of typhoid fever which is now raging in the city of Oakland.

California is, perhaps, the best place in the world to produce pure milk. The climate favors health in the animals. The long dry season does all that natural agencies can possibly do to promote the health of the animals, and consequently the purity and wholesomeness of their products. In the bay region of the State, at least, there is no earthly excuse for miasmatic pools or swamps. There is no high heat and humid air which are such a tax upon animal life in the moist climates of the world. There is abundant circulation of air, moderate temperature, and where any decent care is taken there is pure water. There can be nowhere any better natural conditions for the production of pure, wholesome, nutritious milk.

And yet even in such a region and encompassed by such advantages there has cropped out an epidemic, which has already reached several hundred cases, of which the exciting cause seems to be infected milk attended possibly by defective sewerage of the region encompassed. There is some doubt as to the relative influence of bad milk and bad sewage, but it is claimed that the doctors' carriages in visiting patients, follow the routes of the milk-wagons from the infested dairy, and that other parts of the city as badly sewered, but not having the same milk-supply, are not included in the outbreak.

Nor does the source of infection in the dairy remain in doubt. It is stated that for some time there has been a case of typhoid at the milk ranch, and other cases have appeared later in the same immediate region. Chemical examination of the drinking water of the cows showed filth and organic matter in large excess, and besides this, there is a shallow well, from which water was taken for can-washing and for domestic use, the well being contaminated with sewage, although the chemical examination did not find the same objection to the water that pertains to the tank-water used by the cows. It seems likely, however, that this well water, by bacteriological examination which will probably be made, will disclose the deadly germs which have brought death and disease to so many people.

Such is the record of the evil work which has been wrought upon an unsuspecting community by carelessness and lack of proper precautions which present knowledge prescribes and the neglect of which is little less than criminal. In this case, however, the criminal charge lies against the community rather than against any individual. The dairyman who will supply cows water which he does not know to be pure and wholesome is not to be freed from an atom of the blame which should pertain to such criminal neglect or ignorance. Well-informed and progressive dairymen know that impure water in dairy practice is deadly and they exercise the utmost precaution in their practice. There are, however, especially in the neighborhood of cities, milkmen who are ignorant, careless and filthy in their life and work, and upon them the progress of dairy art and science can exert no influence. They keep filthy cows upon filthy food and drink in a filthy place, and filthy milkers put the filthy product into filthy cans from which is drawn the food supply of the babe and the invalid, as well as the strong man—all drinking disease instead of the health and strength which pure, wholesome milk would freely bestow. Is the public to endure it?

This is the phase of the question which touches most closely upon our field as publishers of a producer's journal. We hold that it is the consumers duty to himself and to the lives entrusted to his care, to know that the source from which his milk is drawn and the surroundings are such as wholesomeness requires. In the case of large towns and cities, it is, of course, impossible that each consumer should personally know these things. For this reason municipalities should give the consumer the assurance which he cannot personally secure. There should be careful and unimpeachable inspection. The parade of the ward-striker whom political interests may sometimes make custodian of the peoples' food and drink, does not answer the need. There should be expert, honest, disinterested inspection. The result would be that the abominable city milk ranches would be made unprofitable, and the crowding together of animals, and its unavoidable dangers would be done away. The city should have pure country milk from cows which have suitable range and the purest air, food and drink.—*Pacific Rural Press.*

Mechanical Progress.

Firebox Steel.

One entire session of the Master Mechanics' Convention last week was devoted to a discussion of the question: How can firebox steel he tested? Some of the facts which developed in it are worth extended notice. It is safe to say that at the present time the firebox causes more tribulation and expense than any other part of the locomotive. Boiler repairs now form a good share of the total cost of keeping locomotives in running order, and boiler repairs are chiefly repairs on the firebox. There is a very general belief, and it is prohahly a correct one, that the life of fireboxes is much shorter now than it was 20 years ago. There is also a very general belief that the cause of the shorter life nowadays is that the steel is not as good as the favorite brands of steel or iron which were in use a score of years ago. It is doubtful whether there is any foundation for this idea. The steelmakers do not take pains to contradict it, for it affords them an opportunity to preach against the practice of buying material on specifications in the open market. When the master mechanic says that steel is not as good as it used to be the steelmaker replies: "How can it be when prices are so much lower? If you will put your trust in me, and pay my price for good steel, I I will make it for you." It is the old story of manufacturer's reputation vs. engineer's specifications in the purchase of material. It was most refreshing to have the fact plainly brought out in the master mechanics' discussion that railways which were relying on the reputation of old favorite brands were being badly disappointed, while railways which were buying material on modern specifications were having comparatively little trouble with their fireboxes.

Really, when we consider the acknowledged great advance made in structural steel manufacture and the fact that the entire art of making soft steel has developed in little more than a quarter of a century, we see the absurdity of the idea that firebox steel manufacture is a lost art.

But, if firebox steel is as good or better than it used to be, why do fireboxes fail in so much shorter time? The reasons as given in the discussion were, first, the fact that a locomotive makes twice or three times the monthly mileage that was made a score of years ago; it runs faster, works harder, burns coal more rapidly, heats its plates hotter, and last, but not least, uses a great deal poorer water than the locomotive of a score of years ago. Ooe speaker in the discussion said that since the forests had been cut off the rivers were muddy in rainy weather and in dry weather were kept up mainly hy springs which carry usually more or less scale-forming matter. It is to be also remembered that in the early days of railroading, to which many of those who are now having trouble with firehoxes look back, the railways of the country were mainly in the East, where pure water ahounds. Trouble with staybolts, firebox sheets, etc., appears to be little heard of now among the railways of New England. It is those in the limestone regions of the West and South that complain.

Of course all these modern conditions of locomotive operation must be met, hut such portion of the trouble as is due to hard water can be avoided by purifying the water for locomotive use. The argument against doing this has always been that the saving was not enough to warrant the expense. But if we are to judge by the experience of the man who said in the discussion that his passenger locomotives required three new fireboxes in five years' service, or the one who said that for even a small increase in the durability of steel plates the railways could afford to pay double the present price per pound—if these things are true, then the gain by pure water would certainly warrant a large expenditure to secure it.—Engineering News.

A New Welding Process.

Before the Society for the Advancement of Industry, at a recent meeting in Berlin, Dr. A. Slahy, of the Charlottenburg Technical High School, gave a demonstration of a new electric process for welding iron, devised by M. Julien, of Brussels. The lecturer took an iron bar which formed one pole of a source of electricity, and plunged it into water containing the other pole. As soon as the bar entered the water, that portion of it immersed at once assumed a white heat; and Dr. Wedding made it into a rivet. This method is based upon the fact that if one pole of a source of electricity is plunged into acidulated water, or water having in it a salt solution, and a sufficiently strong electric current is passed through, oxygen is given off at the (lead) anode, and hydrogen at the (iron) cathode. By increasing the current, the evolution of gas can he augmented to such a degree that the iron har, surrounded by hydrogen, is no longer in contact with the solution. As, however, the hydrogen "envelope" offers great resistance to the passage of the current, considerable heating takes place, whereby the "envelope" and the iron bar are hrought to a white heat or glowing condition. In this way temperatures up to 4000° F. can, it is said, be attained. Dr. Salby states that no difficultles are experienced in regulating the temperature between 800° and 1200° necessary for the forging or welding of the iron, since the degree of heating depends upon the proportionate size of the anode to that of the cathode, as well as upon the available electric pressure. It is claimed that the Julien method is more advantageous than either the Benardos or Thomson electric welding processes, and that by its use iron bars of from two to three centimeters in diameter can be welded with current at a pressure of from 100 to 200 volts. A large lead plate suggested to be adopted as the anode, the cathode being practically formed by the appliance in which the iron bar is fixed for the time being.

Fatigue of Iron.

A highly practical and successful superintendent of motive power, who prides himself on freedom from theoretical nonsense, has taken us to task about our theories on metals being susceptihle to "fatigue." We do not know that the word properly describes the condition metal gets into preliminary to breaking, but highly practical grounds exist for the belief that metals become weakened by use even when no incipient fractures exist. There is a bending or a lengthening and shortening action going on even when the change is too minute for measurement except with exceedingly exact instruments. This movement of the metal causes molecular changes which reduce the adhesion of the particles and thereby make the metal weaker. Nearly every observing mechanic has noticed breakages where it appeared that steel or iron originally good had become so brittle and roughly crystalline that it was unfit to sustain an ordinary load.

A case occurred some years ago on the Central Railroad of New Jersey which appears to be a good practical illustration of the correctness of our theories concerning the fatigue of metals. The company named got six new switching engines that were put into the same hard service in a yard where there was a great deal of running over switches and frogs that subjected the running gear to severe shocks. The engines were all of the same pattern, strongly built, with unusually heavy axles, Col. Ricker, the designer, believing in a good margin of strength. After these engines had been in service for several years, one of them broke an axle. An inspection of the fracture showed that what was originally a fine, fibrous iron had become coarsely crystalline, the molecular change no doubt having been induced by the constant jars. Within six months all the six engines failed with broken axles, and the fracture in each instance showed the same condition of the iron.

Mr. William Woodcock, who was superintendent of the motive power of the Central when these hreakages happened, believed that reworking restored the strength to iron that had become weakened through use. He determined to put the theory to a practical test, so he worked up the broken axles into piston rods, crank pins, rod straps and other parts of locomotives that are subject to severe and complex strains. The metal gave excellent service.—Locomotive Engineering.

COAL DUST EXPLOSIONS AS A MOTIVE POWER.—Accounts come from Germany that Krupp, the famous gun-maker, is now building a number of experimental engines to test a novel idea. A German inventor has taken patents on the utilization of the general principle that finely divided carbonaceous matter floating in the air rapidly explodes. He proposes to grind coal to an impalpable powder, and after introducing the dust floating in the air into the cylinder of an engine, explode it, the idea being to follow very much the same lines which are being so thoroughly developed in the use of gas in engine practice. Naturally, the first question which has risen has been how to get rid of the ash. Krupp is reported to have stated that his experience in gun manufacture convinces him that this is not a serious obstacle. The advantages which would grow out of a direct utilization of mineral fuel as mined are very obvious. While modern practice converts only 10 to 15 per cent of the heat energy stored in coal into power at the crank shaft of a steam engine, it is believed that no less than 75 to 80 per cent could he made available by the direct combustion of fuel through explosion of coal dust.—Coal Trade Journal.

Scientific Progress.

A New Hygrometer.

Owing to the urgent need of a good percentage hygrometer suitable for general use in dwellings, Mr. O. Krell has occupied himself with the subject for some time past, and the results of his investigations are published in a recent number of *Gesundheits-Ingenieur*. The commonly employed hygroscopes are very liable to derangement, and they fail as a rule to indicate the degree of moisture as a percentage ratio, since they record the same upon some arbitrary scale. The instrument of August, which is based solely upon thermometric readings, is not liable to damage. In its general form it consists of two juxtaposed thermometers, one of which indicates the air temperature, while the bulb of the other is surrounded with muslin, kept moist by being dipped into a small vessel suspended below it, filled with water, the water from which rises by capillary action into the twisted muslin. The greater the difference between the temperature readings of the two thermometers with the wet and dry bulbs, at any uniform air temperature, the smaller is the amount of moisture in the air, and the same holds good conversely. Mr. Krell substitutes for the suspended vessel of water a glass tube open at the top, but capable of being securely closed by means of an India-rubber stopper. The lower end of this tube is drawn out to a small diameter, and is curved into a semi-circular form so as to point upward. This tube is placed on a hoard between the two thermometers, which are graduated to read from 8° to 20° Reaumur, hetween which limits the maximum range of temperature in dwelling rooms may he assumed to fall. The bulb of one of the thermometers is inclosed in muslin, attached to the upward-curving end of the water tube, and ahove the apparatus is a board, with a table giving horizontally the readings for each degree from 8° to 20°, with the temperatures indicating each 10 per cent of moisture in the air in a series of vertical columns beneath. By simple reference to this table, on reading the temperatures from the two thermometers, the approximate amount of moisture in the air can be determined at a glance, or, if greater accuracy is needed, intercalation can readily be made.

The Condensation of Ammonia.

M. Frere, In a paper read before the French Association of Gas Managers, remarked that in spite of the lowering of prices, the condensation of ammonia remains a matter of importance to gas works. Sawdust is troublesome, and expensive to work. M. Melon has shown that there are two conditions that must be fulfilled; that the gas should he kept as cool as possihle and that it should be brought into contact with a surface as large as possible, and kept constantly moist. It is not necessary, however, to lower the temperature beyond 50° or 54°, or even 59° F., if the scrubber have sufficient capacity. This is shown by experiments made in practical working, of which M. Frere gave details. The apparatus employed was very simple, being only a Chevalet washer and a water-trickle pebble-column, supplied with from 53 to 88 pints of water per ton of coal distilled. When the temperature of the gas, on its admission to the Chevalet washer, rose from 57.7° to 58.2°, the ammonia remaining in the gas rose from 0.0284 to 0.070 grains per cubic foot. On putting up another pebble tower, in addition to the previously existing one, it was found, on working the water so that the temperature of the gas was never allowed to go heyond 57.2° F., that, even when the external air was at a temperature of 86° to 88° F. in the shade, there was never more ammonia in the gas than 0.0437 to 0.048 grain per cubic foot. In winter less water was used, but the gas contained only from 0.0262 to 0.0306 grain of ammonia per cubic foot.

Ammonia can thus be almost completely extracted by very simple means; and the only thing which needs to he looked after is the water supply to the pebble tower, which must be adjusted each day to suit the external temperature and the quantity of coal which is being distilled. The pebble columns only need to be cleaned about once a year. The tubular refrigerators must be cleared of naphthaline about once a fortnight by means of a steam jet. The moderate temperature employed prevents the deposition of tar in the washer or pebble-column.

Sodium Silicate.

Sodium silicate is a substance not widely known outside of manufacturing circles, and yet it finds so many important uses that a word regarding it may not be out of place. The *Oil, Paint and Drug Reporter* (New York) gives a few words on its industrial uses, and from the note there given we make this extract. The principal use to which it is put is, of course, in the manufacture of cheap soaps, but on account of its properties it is very suitable for use either by itself or in connection with other detergent materials for cleansing articles when the action of caustic soda is too keen and the action of the carbonate not powerful enough. Several of the continental railway companies are using silicate to recover their dirty cotton waste, being ahle thereby to recover the same no less than 12 times, whereas by using caustic soda thls can be accomplished only two or three times at the most. With the silicate the strength of the vegetable fihre is apparently not injured. The silicate has also been used very successfully as a substitute for caustic soda in the manufacture of paper, especially in the bleaching of jute and hemp waste, and in the sizing and waterproofing of paper. It is an excellent fixing agent for alumina and other mordants on cotton, and is said to he unequaled as a sizing for cotton thread in preparing stock for the loom. It has been used for some 30 years for the purpose of rendering textile fabrics incombustihle. Large quantities are consumed in the manufacture of artificial stones, of eoamels and paints, the so-called silicated paints containing silicate of soda as a principal ingredient. The sllicate is also used in construction for rendering timber fire-proof and walls water-tight, or air-tight, for soaking bricks to prevent diffusion, for painting steam-pipes, and, mixed with ashestos, as a non-conducting material for jacketed pans, retorts, etc. It may be used alone or in connection with other materials as a cement for stone, glass, porcelain, marhle, etc., and for attaching labels to metal surfaces. Certain cements owe their hardening property to the silicate of soda contained.

The Welsbach Lamp.

The German *Journal of Medicine* published a circular from the Ministry of Clerical, Medical and Public Institutions in Berlin to the officials of the universities, clinics, etc., in a body. This circular states that several experiments are being made with the Auer lamp (known in this country as the Welsbach) in order to form an opinion as to whether, and to what extent, it is adaptable for use in puhlic buildings, auditoriums, laboratories, clinics, and so on. The above-designated officials point out that they can obtain five times more lighting capacity from gas hy the use of the incandescent gas lights (Welsbach mantles) than they can with the Argand burner, and with considerable economy in the use of gas they can still get three times the lighting capacity. Further, that the incandescent gas light burns evenly and steadily; that the air in the room remains pure; that health is not impaired by its use; that, owing to its white light, it is as easy as with the electric arc lamp to distinguish plainly all the other colors which are found in important operations and researches; finally, that it had proved itself adaptable for microphotography and work with the microscope. After enumerating the above and still other advantages of the mantle, the circular concludes as follows: "After all this, the incandescent gas light can be thoroughly recommended for improving the gas lighting of the universitles, institutes, clinics, etc. In many cases the incandescent gas light makes a suitable substitute for the electric light and causes the latter to be dispensed with. I would respectfully ask you hereafter to please have the incandescent gas light fitted up wherever suitable. The expense incurred can form part of the current expenses. It is fortunate that the Auer mantle, which is the invention of a Viennese gentleman, Dr. Karl Auer von Welsbach, enjoys so pronounced recognition abroad.

THE heaviest element is thorinum, which has an atomic weight of 231.5. The atomic weight of lead is 207, of mercury 200, of gold 196.7, of aluminium 27.5 and of hydrogen 1.

THE breaking weight of one foot of cast iron one inch square is 5781 pounds; the breaking weight of a piece of hickory of the same dimensions is 270 pounds.

Professional.

STEPHEN H. EMMENS,
Consulting Engineer and Chemist,
Youngwood, Westmorland County, Pa.
SPECIALTIES: Nickel, Tin, Dry Placer Development, Treatment of Refractory Ores, Electric Heating and Smelting.

EDMUND B. KIRBY,
Consulting Mining Engineer and Metallurgist
No. 9 Windsor Hotel Blk., DENVER, COLO.
SPECIALTY—The Expert Examination of Mining Investments and Metallurgical Enterprises.

C. A. OGDEN. W. N. JEHU.
JEHU & OGDEN,
Chemical Laboratory and Assay Office.
(Formerly Evans' Assay Office.)
628 MONTGOMERY ST., San Francisco.
ROOMS 46 and 47 MONTGOMERY BLOCK.
Ore Assays, Analyses of Minerals, Waters, all Technical products, etc., made.
Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. ☞ Send for Circular

JULIUS H. STRIEDINGER, M. Am. Soc. C. E. OTTO VON GELDERN, M. Am. Soc. C. E.
STRIEDINGER & VON GELDERN,
CIVIL AND MINING ENGINEERS, TECHNICAL EXPERTS, LICENSED SURVEYORS.
Hereby announce that they are prepared to make the Examinations, Surveys, Technical Drawings, Estimates and Reports required by the
CALIFORNIA DEBRIS COMMISSION.
Created by an Act of Congress, approved March 1, 1893, and to represent the petitioners before the Commission.
Address: 819 Market Street,
SAN FRANCISCO, CAL.

EVERETTE'S MINING OFFICE.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
Mining Law, Mine Examinations, Metallurgy.
ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.

LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges.
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco
We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.Co BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting In Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

MINING AND SCIENTIFIC PRESS.
The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Electricity.

Output of Dynamos.

In the early days of electric lighting a machine that would run, say 200 or 300 incandescent lamps, says Mr. Arthur F. Guy, in the London *Electrical Engineer*, was considered to be a large-sized one, but as time went on, their output became greater and greater, until now, when the electric light may be said to be solidly fixed on sound foundations, for lighting, we have machines built for running 10,000 incandescent lamps of 16 c. p.; and for traction, machines of 2000 e. h. p., or 1500 units. The Westinghouse Company has put down 12 alternators for running the lights of the Chicago Exhibition, each capable of running 15,000 lamps of 16 c. p.; the armatures of these enormous machines alone weigh 18½ tons each. These alternators are believed to be the largest yet run by belting, and it may not be long before such sizes as these, and in all probability larger than these, will be used for generating electricity in central stations. With arc lighting machines working at a constant current, there is a limiting factor, which is very difficult to get over, and that is the pressure. Every additional arc lamp in the circuit signifies another 50 volts pressure at the dynamo terminals. The largest continuous-current arc lighters run 60 lamps in series, and therefore they have a working pressure of 3000 volts. It is very difficult to insulate armatures of continuous-current machines working above this pressure, the high pressure being ruinous to the insulation. In additinn to the inability of the armature coils to withstand such pressures, the greatest care must be exercised by trimmers and circuit men in handling the lamps, wires, etc. Since a full arc lamp takes about 10 amperes, and absorbs a pressure of 50 volts or so, therefore 60 lamps in series will require 3000 volts pressure to maintain a current of 10 amperes through the lot, so that a 60 arc lighter has an output of 30 kilowatts, or units, each lamp taking half a unit.

The output of the electric machines is reckoned in kilowatts, often called for shortness, units, because the kilowatt is the unit of electric power. This expresses the power of the machine or *rate of work* done, and the word unit applied as above must not be confounded with a Board of Trade Supply unit, which is often called a unit for shortness—this latter signifies a kilowatt of electric power working for the space of one hour, and producing a kilowatt-hour of electric energy, or *quantity of work* done.

There are many commercial data concerning dynamos that are very interesting and, what is more, extremely instructive. Among such are: weight, floor space, speed, output, etc., of machines compared with their first cost; and the different pattern machines can be compared, when figures can be worked out, given such data as number of watts a certain dynamo can develop per pound dead weight, the machine compared being of the same, or almost the same, output, speed, type, and such matters; then machines of greater sizes can be similarly compared. Another interesting matter to know is the number of watts per square foot of floor space machines can give for various sizes and speeds. A third matter is the cost per unit for various sizes and speeds. For all the above, curves can be plotted, and it is surprising what a quantity of suggestive information can be gathered from them.

Electric Cooking at Boston.

The people of Boston have been treated recently to several exhibitions of electric cooking apparatus. One of the latest public tests is thus described in the *Boston Traveller* of June 21st:

The American Electric Heating Corporation, 274 Purchase street, was turned into a cooking school at noon yesterday. In response to invitations a number of newspaper and well-known business men were present to witness the operation of some of the company's cooking and heating devices. The most practical illustration was the cooking of a most appetizing dinner on the apparatus devised by the company for this purpose. Of course the enjoyment of the dinner followed, and the cooking was pronounced excellent by all. The ladies, if they could see this apparatus, would go simply wild over it, for though the day was a scorcher, the heat from the oven was scarcely perceptible, and the room was, if anything, slightly cooler than the outside air. In fact, everything connected with this culinary work was so cleanly and so neatly placed and operated that it could be seen that a system of this kind might practically dispense altogether with the ordinary kitchen, and all food preparation be effected upon a side table in the dining room. The process of roasting, boiling, broiling, frying, stewing and making tea and coffee were illustrated, and all in a most satisfactory way. It was explained and readily seen that by this system the heat was concentrated just in the place where it was needed in the various operations, and this accounted for the small amount of radiation of heat from the various cooking utensils. Numerous heating devices were also shown, among them radiators of various kinds for houses, electric cars, etc. The question naturally arises concerning the cost of operation, and this may deter many from looking into it seriously; but, as a matter of fact, the company claims that all matters pertaining to domestic operations or kitchen work requiring heat, can be accomplished as cheaply by the electric current as by the method now in use. In regard to heating by electricity the company makes no claim that it can do it as cheaply as by the use of coal fuel; but it hopes to arrive at that point in the near future. The cooking and kitchen apparatus is all adapted to use any of the electric light currents, from one of 50 volts to one of 500 volts.

A New Electrical Process for Boiler Preservation.

Demonstrations of the efficiency of a new method of cleansing and preserving steam boilers against pitting and general corrosion were made on board the steamship Tenasserim, Glasgow, by the Electric Anticorrosion Company of Cardiff. The process consists of fixing electrodes in the boilers and sending periodically currents of electricity through them under definite conditions, adjusted and controlled by apparatus which is automatic in its action. When the current is passing from the anodes suspended in the boiler to the shell, hydrogen is liberated on the shell and tubes, and oxygen on the anodes; then, by means of the depolarizing apparatus, the action is changed, and most of this hydrogen and oxygen recombine, the result being that during the first period the hydrogen performs two distinct functions; first, it disintegrates mechanically by its volume the scale formed on the shell and tubes; and, secondly, some of the hydrogen combining chemically with the oxygen of the oxide of iron on the shell and tubes, reduces this oxide to metallic iron, thus doing away with the oxidation of the boiler without wearing away the metal. The secondary action, in short, is to facilitate the disintegration of the scale, hasten the mechanical action of the hydrogen in bursting it off, and prevent polarization of the shells and tubes. Oxidation, it is known, cannot take place in presence of hydrogen gas; consequently the patentees contend that it will be impossible for corrosion or pitting to take place on the interior surfaces of the boiler so long as this electrolytic action is maintained; and, further, the mechanical action of the hydrogen, which is capable of disintegrating the scale, will likewise prevent its reformation.

The practical result of the application of the process is that after the apparatus has been working in an old boiler for a few months, the scale is said to be completely removed, and the surface of the iron is brought into sound and healthy condition by a deposit of metallic iron being formed on the shell and tubes. Where no lighting installation exists, the patentees fix a suitable dynamo, which may be driven from the screw shaft, and be of sufficient capacity not only to supply the boilers, but also to light up the engine room. It would seem to us, says the *Engineer*, that the dynamo had better be employed all the time in lighting, and the boilers would be best preserved by feeding them with pure water.

Invention of the Incandescent Lamp.

The history of the invention of the modern incandescent electric lamp is a curious one, says the *Engineering Magazine*. In 1878 the announcement, telegraphed all over the world, that Edison had invented an electric lamp which was to supersede gas as a domestic illuminant caused a wild panic among the holders of gas shares, who hastened to sacrifice their long-treasured securities at almost any price. As it turned out, he had at that time done nothing of the kind, but early in 1880 he actually did produce the long-promised lamp. Patents were obtained, companies organized, and a great business rapidly built up. For six years no serious efforts were made to enforce the patents, and meantime competing companies sprung up and flourished on all sides. Then came the beginning of a long, tedious and enormously expensive litigation, which at the end of another six years ended in the complete triumph of the Edison patent, which was upheld in the court of last appeal. By due process of law the competing manufacturers were one after another enjoined, their factories closed up, and their employes turned adrift. Suddenly one of the concerns thus attacked turned upon its pursuer and aimed a deadly blow at the vitals of the Edison-lamp patent, alleging that the invention had not only been made, but had been publicly exhibited and operated in the streets of New York by an obscure German watchmaker more than 30 years ago. The judge who first heard the new defense deemed the defendant's evidence insufficient, and declined to withhold his injunction, but on a second and subsequent hearing before another judge in another district an injunction was refused, thus rendering it necessary to have the whole case retried on its merits, in view of the new evidence. That the electric lamp alleged to have been made and used by the watchmaker is identical in all essential respects with the modern commercial incandescent lamp is admitted by all the experts, and hence the case is now narrowed down to the sole issue of priority of invention and public use on the part of Henry Goebel as against Thomas A. Edison. It goes without saying that the further proceedings in this most unusual case will command world-wide attention.

AN ELECTRICAL PROBLEM.—One of the most important and difficult problems now confronting electrical engineers is that presented by the condition of affairs in cities where electric railways are operated on the single trolley system. The use of the earth return for the completion of the circuit has brought about a serious accusation against the system—no less than that the escaping current in the earth has been found to seriously deteriorate lead water pipes and lead-covered cables for electric wires by electrolytic action. Complaints on this score have been made in Boston, Cleveland and Minneapolis, and now City Electrician Barrett, of Chicago, has prepared a report on the subject for the information of the Mayor. This paper seems to show beyond question that escaping current from this source does accomplish the injury attributed to it. The situation is clearly one of considerable gravity and must be fairly met. Various remedies have been proposed, but so far none has been devised that has proved entirely successful. Of course the substitution of the double trolley system would remove the cause of complaint, but electric railway companies will exhaust every other means before going to the great expense and introducing the complications which this remedy would involve. Electric railway engineers are devoting themselves assiduously to the problem, however, and we hope that their inventive ability will be equal to the task of hitting upon a successful palliative adapted for commercial use.

THE DEVELOPMENT OF DRY PLATES BY ELECTRICITY.—Dr. Liesegang, of Dusseldorf, has combined two experiments made by Schutzenberger in 1869 and Eider in 1886. He passes a dry current from six Gassmer dry cells through a concentrated solution of sodium sulphate; the zinc pole of the battery is coupled to a large platinum electrode in the outer vessel, and the positive pole is placed in a porous cell filled with the same solution. If a silver bromite plate which has had considerable exposure in the camera be placed in the vessel, a brownish-red negative image is developed in a few minutes, the solution remaining quite clear. The inability of the combination has no effect in this electrolytic method, as it is constantly being produced afresh. The picture is weak and becomes even thinner in the fixing bath.

NEGROES AS IRON-WORKERS.—The experiment of importing negroes from the South, and training them to do the rougher kinds of labor in its rolling-mills, which was recently tried by the Cambria Iron Company of Johnstown, Pa., has been abandoned as unsatisfactory. The blacks, unable to endure the severity of the labor and rigid discipline, left one by one, until they had nearly all returned home. A similar experiment with a similar result was not long ago tried by the Carnegie Company. It seems as if it ought to be pretty well settled by this time that negroes are not adapted to this kind of work.

As an instance of dwindling profits in the British shipbuilding industry, a Glasgow correspondent of *Industries* reports that ordinary cargo steamers, replete with modern appliances, are now contracted for at prices ranging from $26.40 to $28.80 per ton, or just one-half of the cost some four years ago. The dearth of orders is beginning to be seriously felt in the shipyards on the Clyde

Useful Information.

Compressed Fuel Manufacture.

For the last 30 or 40 years, according to the coal waste commission's recently issued report, a large amount of the culm of the semi-bituminous and anthracite coals has been utilized in Europe in the form of what is known as compressed fuel. The slack, after being mixed with some binding material, such as lime, clay, cement, tar, pitch, bitumen, starch, or other glutinous substance, is compressed into rectangular or spherical forms and then burned as large coal of the same size would be. Large quantities of this material have been made with profit in Europe, and many attempts have been made to utilize culm in this way in the United States. About the year 1876 the manufacture of compressed fuel was begun by the Delaware and Hudson Canal Company, Rondout, N. Y., from 92 per cent of culm and 8 per cent of pitch. The plant was sold to the Anthracite Fuel Company in 1876, and the making of bricks discontinued in 1880. Culm and gas-coal pitch were mixed in a pug mill with super-heated steam. The bricks were made of a size much like that of ordinary building bricks, under a pressure of 250 pounds per square inch. These bricks would not disintegrate in the fire, and could be repeatedly heated red-hot and then plunged into cold water without crumbling. But the cheapening of coal and additional cost of pitch drove the bricks out of the market. Of plants making compressed fuel for domestic uses, in the form of eggettes, the constituents being anthracite screenings or bituminous slack with three to six per cent of imported bitumen, there are enumerated as in present operation the plant at Gayton, Va., using semi-bituminous, the capacity of which has recently been doubled; that at Milwaukee, which utilizes anthracite screenings made in the shipments of anthracite coal from lake to lake ports, and that at Huntingdon, Ark., which utilizes bituminous slack. In addition to these, a new plant has been ordered to be constructed in Chicago, with a capacity of eight tons per hour, hard and soft coal; and another new company has been recently organized to erect one at Denver. The commission's inquiry has led it to believe that "this method of utilization seems to be most successful in cities where the coal can be sold well and where there is no freight to pay."—American Manufacturer.

Manufacture of Alum in India.

There are some alum works at Kalabagh, on the Indus, at the western end of the salt range in the Punjab. They are owned and superintended by a native khan, who is said to be worth some two lakbs of rupees. The raw material or black alum shales, composed of silicate of alumina and iron pyrites, are brought by coolies from a spot about two miles away to the river bank at Kalabagh, and broken up into lumps about five inches across. A layer of brushwood and small branches is spread on the ground, and above this are placed alternate layers of about a foot thick of broken-up shales and brushwood. The heap is made about fifteen feet high and is then ignited from below. The burnt clay is then thrown into square earthen vats about ten feet long and two feet deep, and thoroughly mixed with water. The water containing the soluble part of the burnt shale is after a time drawn off into a similar vat, and the red suspended matter allowed to settle. It is again drawn off into a shallow circular vat about ten feet in diameter, and made of plates of sheet iron riveted together. A furnace is built under this. The solution is then boiled with an impure sodium and potassium salt called "jamsan," obtained from "reh," the sodium sulphate and carbonate efflorescence, found so commonly in the Punjab. The liquid, after boiling some twenty-four hours, is drawn off, and allowed to crystalize in vats of sun-dried clay. The crystals are about half inch in thickness, and of a light grayish-green color. These are stacked and allowed to drain for ten days. After this they are put into earthen pots, holding about 1½ maund, with a little water, and are heated in a kiln or oven. The earthen pots are broken open when cool, and large crystals of alum some six inches long are found inside.—Artisan.

USE OF MONKEY WRENCHES.—Don't use a monkey wrench backward, *i. e.*, do not put the strain on the wrench so as to spread the jaws. This can easily be remembered by always thinking to pull the way the jaws point. The spreading of the jaws, which we so often see, is caused by the back or main bar of the wrench bending under the strain. So, if we pull backward, there is nothing to keep the bar from bend-

ing hack; hut if we pull as we should, the hack cannot bend unless the nut or bolt-head crush or the jaws give way to a slight extent or the bar actually stretches. As neither of these are likely to occur in ordinary use, it can he said to he almost impossible to hend a wrench until the jaws open like an alligator's, if we take the precaution to always pull the way the jaws point, which can easily be done.—Artisan.

The Ocean Racers' Coal Bills.

Referring to a paragraph going the rounds to the effect that an "ocean racer" hurns about $13,000 worth of coal every trip, the *Marine Journal* says:

"Very little calculation will show how extravagant this statement is. The American liner New York consumes about 328 tons per day, the White Star liner Teutonic about 316 tons and the Cunarder Etrurla 330 tons per day at full speed. It has heen stated that the Etruria, at a speed of 18 knots, hurns only 275 tons per day. This consumption would send the greyhounds across with a total use of about 2000 tons in round figures. The price of coal in New York is considerably less than $4 per ton, and in Liverpool it is cheaper than here, hut even at outside figures the cost of fuel per trip, it will be seen, does not exceed $8000, and we would not he surprised to find the actual average price paid to he less than $6000.

"The fuel hills of such ships are of course far in excess of those of the average ocean steamer. The triple-expansion engines and improved machinery of the present day have made it possihle to so economize coal that the indicated horse power per hour has heen reduced in ratio to much less than two pounds, as against nine pounds in 1836 and five and one-half pounds in 1840. The Teutonic's average is quoted at 1.6 pounds per hour. The majority of ocean steamers of ordinary size, traveling at an easy gait, think a ton of coal per hour is quite extravagant enough for their propulsion. Our hig new warship Iowa will have a hunker capacity of only 2000 tons of coal to speed her at 16 knots, the Indiana's hunker capacity will be 1800 tons, the 3000-ton cruiser Cincinnati's bunker capacity will be only 556 tons, and the crack Japanese ship Yoshino, with a speed of 23 knots, has hunkers to hold only 1000 tons. It is douhtful if the hunkers of any steamer afloat would hold $13,000 worth of coal if bought in New York."

Stone Lithography Discovered.

One of the greatest discoveries ever made was the result of the purest accident, says *Stone*. It was the year 1796. The citizens of Munich had just witnessed the first triumphant performance of Mozart's opera, "Don Juan," and the theater was deserted hy all save one man, Alois Sennefelder, who, after making a round of inspectlon in the huilding to see that no sparks had ignited anything comhustihle, retired to his room to stamp the tickets of admission for the day following. When he entered his apartments he had three things in his hand—a polished whetstone which he had purchased for sharpening razors, a ticket stamp still moistened with printing ink, and a check on the treasurer of the theater for his weekly salary. As he placed the latter upon the table a gust of wind swept it high up in his room for a moment and then deposited it in a basin filled with water. Sennefelder dried the wet paper as well as he could and then weighed it down with the whetstone, upon which he had before carelessly placed the printing stamp. When he returned to his room the following morning he was astonished at seeing the letters of the stamp printed with remarkahle accuracy upon the dampened paper. A thought came to him. He wondered whether hy some such means he could not simplify his work of continually copying the songs of the chorus. He went out and purchased a large stone, commenced making experiments, and, as we all know, finally discovered the art of printing from stone—lithography.

SPIDER'S WEB FOR TELESCOPES.—The exceeding fineness ot the spider's web long ago suggested its use as a textile material in place of silk, and very delicate fabrics have been thus produced. But it was evident that no results of practical value could be attained in this line, unless spiders could be reared in large numbers and the thread wound from their cocoons. Individually the spider lends himself to this purpose in a very satisfactory manner; hut the thing which interfered with the prosecution of the industry, and finally frustrated it altogether, was the inconvenient habit which the large spiders have of eating the smaller ones, this practice continuing in a colony until in a very short time only the higgest spider remained, rendered still higger hy having assimllated its companions.

One important use remains, however, to which the spider's weh is admirably adapted—that of making the vertical and horizontal lines which are stretched across the field of vision of a telescope. Nothing hetter than the spider's web can he desired for this purpose, it heing very strong as well as fine, and proof agalnst expansion or contraction hy heat, cold or moisture. It was at one time supposed that the hest threads might he ohtained from the large spiders of China, hut experience has shown that the American "turtle-hack" spider has no superior in this respect. It ahounds in the neighhorhood of Washington, where its weh is gathered to he used in the telescopes of the United States Naval Observatory.—The Paper Mill.

A NEW SAFETY LAMP FOR MINERS.—St. Louis *Globe Democrat:* "An ingenious form of electric saiety lamp is now made for use in dangerous mines, powder magazines and all places where an accidental breakage of the glass hulh might lead to an explosion. In order to entirely eliminate the chance of any such danger the inventor has enclosed the lamp proper in an ahsolutely air-proof lantern, the peculiarity of his device heing the means of switching the light on and off. The wires are attached to the internals on the hase of the lantern, and underneath the lamp socket there is a small pair of hellows which make the necessary contact on heing inflated. On the cap of the lantern is an air valve to which a ruhher pear-shaped syringe can he attached. On compressing this the hellows become distended and switch the light on. Should the lamp fall and he hroken the escape of the compressed air releases the switch and instantly cuts off the current. Moreover, should the interior lamp happen to be broken the superfluous air fills up the vacuum and the same effect takes place."

FIRING AN ENGINE.—Did you ever notice a fireman feeding an engine? There is a science about it that is not understood hy one not in the husiness. There is a way to throw in the coal, and to empty the shovel and close the furnace door at the same time that requires nice calculation. The same science will tell how many scoop-loads are needed to send the hands on the gauge to the proper figure. Deft handling to keep the deck of the cahin clean and a hundred other lIttle things that go to make a skillful fireman—one that saves money hy hushanding the coal. The fireman in the old days on the wood hurner had a hard time of it and certainly earned the small money he received for his services, hut he had a sinecure compared with the man who stokes up one of the huge "moguls" of the present day. These engines haul freight and eat up coal as if it were greased paper. The fireman is at work continuously.

IN the year 1892 the Almaden mines, Spain, produced 20 473 tons of quicksilver ore, of which 13,488 tons were treated. The output of quicksilver was 44,804 flasks of 34.5 kilos. "El Porvenir," a new mine in the Asturias, working a sandstone carrying sulphuret of mercury, produced in 1892 from 5350 tons of ore 2087 flasks of quicksilver.

In the matter of inventions, it is a curious fact, says the New York *World*, that Prof. Bell's latest devlce of importance, the "waterphone," for locating leaks in water pipes, was suggested to him hy observing a plumher's apprentice endeavoring to find a leak by means of a small rod which he held in his mouth and touched against the pipe.

To the World's Fair!

WEEKLY EXCURSIONS!

Are you going? If so, call on or write to the undersigned before arranging for your trip. The "SANTA FE ROUTE is the only line under one management from California to Chicago! Palace and Tourist Sleepers through to Chicago every day without change! Excursions every Tuesday. W. A. BISSELL, G. P. A., 650 Market Street, Chronicle Bldg., San Francisco, Cal.

The Explorers' and Assayers Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Aessaying, and Metallurgy.
Price, $6.00 post-paid. Sold hy DEWEY PUBLISHING CO., Puhlishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the varione formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from ormule as possible. This work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is ussful to unsducated men as well as scientists.

EB WILLIAMS,
ATTORNEY - AT - LAW,
NOGALES, ARIZONA.

Will give attention to the collection of olalms and settlement of business in any part of Mexico.
References—L. C. Hughes, Guerno; Roy & Titcomb Nogales; International Bank, Nogales.

DIVIDEND NOTICE.

THE GERMAN SAVINGS & LOAN SOCIETY
526 California Street.

For the half year ending June 30, 1893, a dividend has hasn declared at the rate of five and one-tenth (5 1-10) per cent per annum on Term Deposits, and four and one-quarter (4¼) per cent per annum on Ordinary Deposits, payahle on and after Saturday, July 1, 1893.

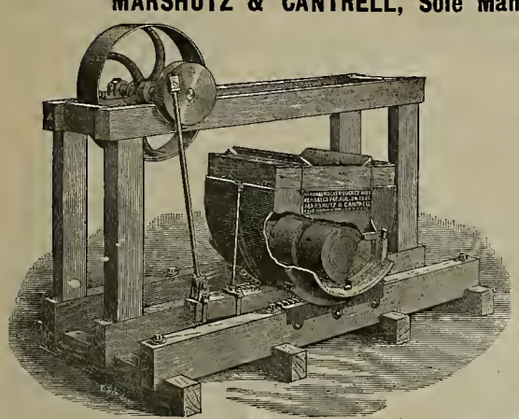
AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machinee now before the public.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Calaveras.

STARTED UP AGAIN.—*Mt. Echo*, July 8: Operations were resumed in the Calaveras Consolidated mine at Robinson's Ferry last Monday. Quite a large number of men were put at work in and about the mine, and things are now running as of yore. This property has lain idle for a year or more, and it gives us pleasure to announce the fact of the resumption of work.

THE LITTLE GIANT recently placed in position at the Stickle mine, as a protection against fire, has been tested and gives the best of satisfaction. It throws a large stream of water a distance of nearly 300 feet, and the pipe can be handled almost as easily as a garden hose.

THE BOLITHO quartz mine, situated near Angels, owned by Hardy and Osborn, ranks among the best mines in this part of the country. To be sure it is not thoroughly developed as yet, but sufficiently so as to demonstrate the fact that it is a valuable mining property.

Humboldt.

HYDRAULIC MINERS HAVE WATER TO SPARE.—Blue Lake *Advocate*, July 8: The *Advocate* has already contained an intimation that the miners along the Klameth from Weitchpec to the Siskiyou line were exchanging smiles of supreme satisfaction over the possession of a supply of water that would enable them to run much later than usual. This virtual assertion receives emphatic corroboration from Mr. William Garrett, of Orleans Bar, who last Saturday was in town. The following named hydraulic mines are now in operation: Two claims of William Lord at Weitchpec; the Allen & Lord mine at French Bar, 12 miles above; Allen & Lord's Redcap claim one mile farther up; J. A. Pearch's mine at Orleans; Alexander Markson's claim, two miles above Orleans, and the Nelson mine near the Siskiyou line. With regard to the length of time these claims will be able to run, Mr. Garrett thinks that while some may close down about August 1st, others will be in a position to continue until the middle of that month.

THE MOREE HILL MINE.—Mr. W. G. Miller is home from the Klamath. He is billed for a stay of a month at least in Blue Lake, there being a temporary lull in operations on the Morek Hill mine. Hitherto water for prosecution of operations has been derived from two sources, Cappel creek and a gulch hard by, the combined streams being sufficient for all purposes. But the flow from the gulch having given out, there ensued a deficiency which cannot be provided for until the capacity of the ditch from Cappel creek shall be increased. There is no abatement of faith in the mine there. No doubt exists in the mind of anybody acquainted with it that it is very valuable property, and work upon it is to go right on. Mr. Ralph Pentin remains here.

Mariposa.

QUARTZ MINES.—Merced *Star*, July 7: There is no part of California where the field is as good for investment in quartz mines as in Mariposa county. Of course the old Fremont Grant covers a large scope of the mining lands of the county, but there are places outside of these lines which are rich in quartz and placer gold. The country in and around Hornitos is still rich, and with a judicious outlay of capital could be made a thriving section in a very little while. There are numerous good mines there that have yielded large returns in days gone by, and with a very small outlay could be put on a bullion-producing basis. Fuel is the largest item of expense, but with the improved electric appliances this cost could be greatly reduced. Other sections, such as Sherlocks, Whitlocks, Colorado, Sweetwater, Hite's Cove and Coulterville, all abound in rich quartz mines, which, with careful management, could be made to yield handsome returns. Coulterville is showing up good mines all along the line. The Southerland, after long work of very discouraging nature, has at last proved a very rich property and the shipment of bullion is a monthly occurrence. The mines of the Cook estate are attracting a good deal of attention and will soon pass in other hands and the property put into shape for active work. These mines are very rich and the suspension of operations was caused by the death of the owner. Perhaps no mining field in the world is so undeveloped as Mariposa county. Here, within 200 miles of San Francisco, are vast areas known to be rich in mineral wealth, but almost entirely undeveloped. It is singular that most of this district, while now undoubtedly richer than the average diggings of '49, is passed by for other districts not nearly so promising and far more remote. That a day of prosperity will soon dawn for Mariposa county cannot be doubted by those who are keeping in touch with mineral development elsewhere. The enterprising and adventurous will reap the reward.

Mono.

A PROFITABLE SALE.—Bodie *Miner*, July 7: The expert who was sent from San Francisco to examine the Ward mine at Green creek, for a company of mining men, has returned to that city, taking with him a number of samples of the ore. From his examination he was much pleased with the property, and if the samples taken below yield satisfactory returns, there will no doubt be a sale.

ABOUT BENTON.—Hawthorne *Bulletin*, July 7: A correspondent at Benton writes as follows: A reported rich gold find in Clover mining district, some two miles from the Wild Rose mine, comes to hand. Ore assaying way up in the thousands has been brought in. This is supposed to be the finding of a long-lost mine, originally discovered by an Indian, and somewhat resembling in its history the famous Pegleg mine of southern California. On Blind Spring Hill the mining outlook is not of an encouraging nature, owing to the present silver depression and lack of production of high-graded ores.

Nevada.

BETTER TIMES AHEAD.—*Herald*, July 7: The Bloomfield mine, at Malakoff, which is now being worked by the elevator process, as used at the Kate Hayes mine, French Corral, is reported to be doing well. A number of men have been put on lately, and, the mine being well lighted throughout by electricity, the miners are kept working night and day. This means better times for North Bloomfield, and the rest of the county will rejoice with that town in its future prosperity.

THE PROVIDENCE QUARTZ MINE. — Nevada *Transcript*, July 8: When the Providence quartz mine was closed down a few years ago it gave Neveda City the blackest eye in the quartz-mining line that it had ever received before. But of course the greatest blow we ever experienced was the stopping of the hydraulic mines. When the owners of the old Providence ceased working their mine even the most enthusiastic believer in the district looked somewhat crestfallen, and began to think that if the "old reliable" (by which name the mine was familiarly known) had petered, surely there was not much hope for any other mine, and it would be only a matter of a short time when the beautiful Queen City of the Sierras would be inhabited only by the wild beasts of the forest, or, in other words, it would be knocked into "smithereines" as badly as the Meadow Lake district. The suspension of work at this mine had a bad effect generally upon the whole district. Mining speculators and capitalists, when they learned that the principal mine in the district had given out before any great depth had been reached, very naturally concluded that this section was a good place to keep away from. For a long time monied men could hardly be induced to talk about our mines, and would not listen to any proposition to invest, notwithstanding the most liberal offers were made to them. Four or five San Francisco gentlemen finally came up and examined the mine, with a view to purchasing it, and they did so and placed Col. Carl Davis, one of the best quartz miners in the State, in charge. Regarding the outlook as favorable, they bought the mine and placed a large sum of money in bank for the purpose of developing the property. There was much "dead work" to do before anything else could be done. The main shaft had to be retimbered in many places and repairs were necessary here and there throughout the mine and works. At first employment was given to about a dozen men, which force was increased from time to time, and to-day the company have 81 men on the payroll. They have erected the finest chlorination works in the State, which are in full operation, working all the sulphurets that come from the mine. Thirty stamps are kept running night and day and there is ore enough in sight to keep the mill going for an indefinite period. There are two ledges in the mine, one being in slate, the other in granite, both of which are looking well. The history of the Providence mine is similar to that of other mines in this county, and shows that mines are often considered worked out, when in reality their development has only just begun. The old theory that gold quartz ledges do not extend beyond certain depths has been exploded and by the use of improved methods, economical and skillful management, many other mines that have been closed down could be reopened and successfully operated.

CENTENNIAL MINE.—Grass Valley *Telegraph*, July 10: Mr. A. W. Stoddart, superintendent of the Centennial mine, returned from Sacramento Saturday night. Immediately upon his arrival men were engaged to start to work at the mine, and operations will be vigorously prosecuted. There is a fine plant upon the mine and in a very short time the water will be pumped out and a force of miners put to work stoping out the rich quartz for which that mine is famous. The company recently formed in Sacramento to operate this property has great faith in the mine, and we are glad to see the people down in that section of the country manifest so much interest in our quartz mines. Grass Valley is to-day the best mining district in the State, and has been for the past 40 years.

AN APPRECIATION.—There was never a more surprised man than George Starr on Saturday. Mr. Starr is and has been the superintendent of the Empire mine for years and has tendered his resignation to the company, to go to South Africa. The miners of the Empire gathered together on Saturday afternoon and the stamps, cages and everything around the mine was stopped, while Mr. Starr was suddenly sent for and found an elaborate lunch spread out before him and a beautiful gold watch and chain awaiting his acceptance. The gift was presented by the employes of the mine and Mr. Richard Angove was the "talker" on the occasion, and he did his speech so well that George Starr could hardly "come back." The gift is a beautiful one and is highly prized by the gentleman who received it from such appreciative friends.

Placer.

GOOD GRAVEL.—Colfax *Sentinel*, July 7: The Morehead mine at Deadwood is yielding good paying gravel at present, and bids fair to become a good mine. Dr. J. LaBaree of Forest Hill is at present in San Francisco organizing a company to work his mine near Weske Hill. Mr. LaBaree has spent considerable money in developing his property, and has considerable faith in its ultimate paying qualities. The mine is known as the Louisiana Consolidated, and, no doubt, if Mr. LaBaree's plans as to its development succeed, it will be one of the mines of the divide. The Mayflower is running with the customary force. At present an air-shaft is being sunk by the boring machine. This machine continues to work well, and is a great saving in prospecting. The work of pumping out the water in the old Turkey Hill mine is progressing very well, and in a few weeks it is supposed that it will be emptied. This mine itself is not to be worked, but adjoining ground is to be worked through it. If this venture is a success, it will benefit Michigan Bluff a great deal. The Hidden Treasure at Sunny South continues its usual dividends. The same may be said of the Morning Star at Iowa Hill and the Pioneer mine at Damascus. There are quite a number of miners on the Forest Hill, Iowa Hill and Dutch Flat divides prospecting for gravel and quartz, and the indications are that in the next few years quite a number of new mines will be developed.

WHAT A DIFFERENCE.—What a difference six or eight millions of dollars a year from the hydraulic mines would make in these panicky times in California? Much of the distress of to-day would be relieved if the hydraulic mines were again allowed to give employment to thousands of people. The farmers themselves would reap the benefit at once in the hundreds of thousands of dollars worth of produce that the miners would buy from them.

San Bernardino.

VANDERBILT DISTRICT.—Los Angeles *Herald*, July 8: For the past six or eight months the attention of prospectors and monied mining capitalists has been directed to Vanderbilt, the new mining district in San Bernardino county, 35 miles this side of the Needles. The camp was first brought into prominence by the news of a rich strike by Mr. Taggart and some others some time last year. It had been known to prospectors for years past as a rich country, but as prospecting was accompanied with great difficulties and hardships, it was not carefully gone over until the advent of Mr. Teggart. Since then a large number of prospectors have gone into the new district and have staked out many claims. There is one very remarkable feature of Vanderbilt, however. Thus far its growth has been healthy and it has advanced steadily. As yet the bare grub-staked prospector has not put in an appearance to any great extent, no mushroom excitement has been raised, and all is moving forward with healthy steadiness. Extensive capital has been placed in the district, and the work of developing the different claims goes along easily and surely. There is no question but that Vanderbilt has a great future before it, as the presence of the capital of men like Mackay and Flood would naturally suggest. Copper, some silver, galena and iron are also found, but the big-paying metal is gold, which is in the greatest proportion and value. Copper is also found in good quantity. The most of the ore throughout the Vanderbilt district is easy to work.

San Diego.

JULIAN NOTES. — *Sentinel*, July 7: Louis Shilling has been working a ledge of glassy-looking quartz at odd times a short distance from his home. A few days ago he struck a rich bowlder abounding in sulphurets of iron at a depth of about 15 feet, very rich in free gold. Quite a number of batches await crushing at the Ready Relief mill in Banner. A large body of very rich rock abounding in free gold is being worked in the lower level of the Ready Relief.

Siskiyou.

BLUE GRAVEL.—Yreka *Journal*, July 5: Day and night shifts are kept steadily at work on the Greenhorn blue gravel mine, with good success. Owing to the foul air, the men are now running a tunnel to the open shaft at the north end of the claim, in order to obtain a current of pure air. Before suspending work to open a passage to the north shaft, the blue gravel taken out was paying handsomely, which the men will commence taking out again by the end of this week. Twenty-three men are employed in working this mine, and the gravel bed is about 107 feet below the surface. The company expect to help out the financial market to a great extent this summer in supplying gold for circulation. The river miners at Honolulu on the Klamath river are pushing work in sinking down to pay gravel, the season being later than usual, to keep the river too high for getting the wingdams built until late. Although they may not have as long a term for operating their claims as customary, they feel confident of taking out a good average yield of gold dust. C. B. Jillson & Co., of Cottonwood, have had a fine run in their blue gravel hydraulic mine this year, and as soon as the water supply slacks up to suspend operations, will clean up, expecting to realize the largest yield of glittering dust yet procured from their claim. The winter rains come just right to keep up the water supply, and the frequent spring rains and cool weather also proved highly advantageous. It is reported that W. H. Smith, of Cottonwood, has made a deal with a mining expert for the sale of his hydraulic claims to a Minneapolis syndicate, at a good figure. The agent of the company has given the claim 30 days trial in prospecting, and was so well satisfied that a bonus has been put up to secure the transfer. There will be considerable work carried on this season in quartz mining on Hungry creek in the Siskiyou foothills, where some very rich lodes exist, that require only the investment of capital to develop them with great profit. Operations will be commenced there just as soon as the snow disappears, which will be very shortly.

Sierra.

THE JOHNSTON CONCENTRATOR.—*Mountain Messenger*, July 1: In company with Jos. Ruth, the editor visited the Gold Bluff quartz mine last Monday afternoon, for the purpose of inspecting the new Johnston concentrators, recently put up by Supt. Kraft. These machines were invented and patented by Geo. Johnston, who, by the way, was the first inventor of the revolving belt concentrator, "with raised edges and a shaking or rocking motion from side to side," which was patented July 9, 1867, by Geo. Johnston and E. G. Smith. His latest patents of Jan. 10 and 31, 1893, are the best, however, as simplicity, great durability, ease of operation and marked increase of sulphurets saved were the objects aimed at. This concentrator has the belt frame suspended from four non-parallel hangers placed in the frame, end, by regulating their angle, the oscillation necessary to keep the sides of the belt from being overloaded with sands is obtained, while the oscillation is not sufficient to overload the belt in the center, which is the case with the rocker. The belt is made of canvas, and is a big improvement on the old rubber belts. Numerous small rollers at an angle of 45° stand in a slotted base screwed to the top of the belt frame, which effectually prevents overflow by keeping up the sides of the belt, and if the belt shifts to either side it can be followed by these rollers and answers all the purposes of molded edges, which are always very expensive and short-lived. The pulp box discharges the pulp in narrow channels five or more inches apart in the direction of the belt's travel, leaving spaces on the belt where sulphurets can remain undisturbed by the fall of water and sand, and pass up to the clear water at the head of the belt, while the sand at the same time passes down unobstructed. The machine has a 2½-inch shake and 112 actions to the minute. To illustrate the amount of work one of them can do, it is only necessary to state that two of the Johnston concentrators have been taking pulp from 20 stamps, which is double the work any other machine on the market will do. In addition to this, half a ton of sand was fed into the machines one day last week, and they handled the 20 stamps and the extra sand in a most satisfactory manner, and were not overcrowded then. Taking it all together, it is the best and most satisfactory machine we have ever seen. To prove what Supt. Kraft thinks of them, we will say that as soon as he saw them work he immediately ordered two more, which arrived last Monday and were immediately set up. We have just learned that the result of the four last assays of tailings is only a trace of gold. Supt. Kraft is highly pleased. After we had inspected the lower department, we were taken in charge by Amalgamator George Black and shown through the mill. George has had many years' experience as amalgamator in many different mines throughout the county, and thoroughly understands his business. Jake Bernhardt is night amalgamator and Otto Nessler runs the rock-breekers in the daytime, and keeps enough rock crushed and in the bin to make night running useless. Supt. Kraft has displayed great caution in choosing his mill hands, and has about as able a crew as it has ever been our fortune to see. Gold Bluff is bound to prosper, and we predict a bright outlook for our other rich quartz mines in this vicinity, especially the old Good Hope, now known as the Oxford.

Tuolumne.

TUTTLETOWN NOTES.—Tuolumne *Independent*, July 8: The McAllister brothers are working the Atlas and are getting a good prospect. Pocket mining on Jackass Hill is not a very lucrative calling just at the present time, although a good many follow it. Messrs. Snow, Brownlee and Elsbree are getting a good prospect on the old Wickam and Gele claim, owned by J. N. Gillis. William Moyle and Robert Coughlin continue to take out good milling ore from their mine. They had some rock crushed at Joe Hempton's mill avereging $71 per ton. The pay chute is over 60 feet long, and they have about as good a claim as a person could wish for, and are deserving of their find. Sherman Wetmore and Mr. Penrose are also working on their mine, giving the owners a royalty and are doing well. Mr. Albert Virtong has sunk a shaft down 60 feet and has a fair chance to get a bonanza his gold magnet has located for him. J. N. Gillis is interested in the contrivance and if gold can be found by the use of it, he says he is a millionaire. One thing we know about it, Mr. Virtong has faith enough to back his claim by the use of giant powder and plenty of good muscle.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia *Chronicle*, July 8: 1500 level—A winze started at the end of the drift run east from the bottom of the winze sunk from the end of the southwest drift, 75 feet above the sill floor of this level, has been sunk during the week 5 feet in quartz and narrow streaks of ore assaying $20 per ton. Have been making repairs to the main south lateral drift on the sill floor of this level. 1600 level—Gas has been escaping from the old stopes which lie in the northern part of the California ground east of and above the sill floor of the main south drift, and is coming out into that drift. We are bulkheading and closing the openings in this ground in order to confine the gas in that end of the mine. 1650 level—Have continued making necessary repairs to the drifts on the sill floor of this level and to extract some ore in working north from the crosscut run west from the northwest drift. The upraise which was started from the drift run west from these north workings, 27 feet above the sill floor of this level, has been carried up 7 feet; total height, 83 feet, the top being in porphyry. Have continued to extract some ore of average quality in working on the north and south sides of the drift run east (at a point 20 feet down) from the winze which was sunk from the crosscut run west from the main northwest drift. Have continued to extract

some ore of very good quality in working upward from the end of the drift run south from this winze at a point 52 feet down. To some extent, there was a cessation of work in the mine on and about the Fourth of July, and three days only were devoted to the extracting of ore, in which time 191 carloads were raised to the surface (about 185 tons), the average assay value of which was $38.12 per ton. There was worked at the Morgan mill during the week 204 tons, the average assay value of which (per battery samples) was $28.15 per ton. Bullion shipped to Carson Mint, assay value, $33,319.31.

OPHIR.—1565 level—The crosscut running east from the winze station on the sill floor of this level has been extended during the week 12 feet; total length, 125 feet; continuing in a formation of porphyry carrying clay separations. Have continued the work of making the necessery repairs in the shaft, being joint work with the Mexican Company. On the 4th and 5th of July all work in the mine was suspended. Resumed work on the morning of the 6th. On the 1465 level, south from the Ophir shaft, we are closing some old openings that lead to the old stopes in the north part of the Con. Cel. & Ve. mine, in order to prevent the entrance of gas, which is generated in and now escaping from those stopes.

MEXICAN.—On the 1565 level—The east crosscut from the north drift from the crosscut run east from the bottom of the winze, has been extended 7 feet; total length, 73 feet, in a porphyry, clay and quertz formation. Have continued the work of making the necessary repairs in the sheft, being joint work with the Ophir Company. Our mein operations in the mine were euspended for two days during the week.

UTAH.—340 level—The north drift from west crosscut No. 3, at a point 100 feet in from its mouth, has been extended 12 feet; totel length, 63 feet; continuing in quartzite and porphyry formation showing some value.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 11 feet, making the total length 447 feet; the face is in clay and soft porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 17 feet, making the total distence west of the joint shaft 3323 feet; the face is in porphyry and streaks of quartz.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advenced the past week 17 feet, making the total distence west of the ehaft 3323 feet; the face is in porphyry and streaks of quartz.

ANDAS.—On 420 level, south drift from east crosscut No. 1 north, has been advanced 7 feet; total length, 61 feet. Work in thie drift temporarily euspended. We are cleaning ont eaet crosscnt No. 1 south for the purpose of ehutting off the water that comes from this drift.

GOULD & CURAY.—200 level—Weet crosscut No. 5, etarted in northwest drift, 432 feet from main west drift, hes been edvanced 6 feet; face in hard porphyry; total leugtb, 536 feet. Sntro tunnel level—At a point in east crosscut, 75 feet from main uorth drift, have started a north drift and advanced eame a distence of 12 feet; face in quertz. Also did some repairing to the main north drift.

BEST & BELCHER.—200 level—In northwest drift, 265 feet from onr south boundary, we have etarted east crosscut No. 1 and advanced same 8 feet in quartz giving low assaye. 900 level—The southwest drift, started from west crosscut No. 3, 20 feet from npraise No. 1, from 1000 level, has been advanced 12 feet; total length, 190 feet; face in soft porphyry. Sntro tunnel level—At a point in east crosscut, 75 feet from main north drift, have started a north drift and advanced same a distauce of 12 feet; face in quartz. Also did some repairing to the main north drift.

HALA & NORCROSS.—On 900 level have advanced the south drift 19 feet; totel length, 68 feet; face in porphyry. 1100 level—Heve advanced the south drift 18 feet; total length, 56 feet; face in phrphyry. Main shaft—We continue retimbering above tbe 1200 level, and are repairing main incline where necessary. No work was done in the mine from the morning of July 4th until the evening of the 5th.

CHOLLAR.—Are repairing the main tunnel on 250 level. We are putting in new timbers at a point 40 feet bslow the 850 level in main shaft. The north drift from the east crosscnt near the south line, 930 level, is ont 126 feet; face is in porphyry and clay.

POTOSI.—The south drift, 35 feet west of the main shaft on the 850 level, is out 130 feet; face ie in porphyry and seams of quartz. The raise in north drift, 100 feet north of east crosscnt, 930 level, is up 108 feet on the slope; the formation is soft porphyry and bnnches of low-grade qnartz. Extracted and sent to the mill the past week 559 tone and 250 pounds of ore from the 550, 930, 1000 and 1150 levels. Milled during the week 559 tons. On hand at mill 167 tons and 750 ponnds. Average battery assays, $30.98; average car sample assays, $29.71. Shipped to the U. S. Mint, Carson, 773 ponnds crude bullion.

WAAD SHAFT.—Have been engaged all the week cutting out statiou at the 820 level.

EXCHEQUAR.—Have been engaged all the week cutting out station at the 820 level Ward shaft.

ALPHA.—Have been engaged all the week cntting out station at the 820 level Ward sbaft.

BULLION.—Have been engaged all the week cutting out station at the 820 level Ward shaft.

OCCIDENTAL.—From the stopes and upraise on 650 level, we have extracted about 45 tons of fair-grade ore and are preparing to resume the extractiou of ore from the west ledge ou the 400 level.

KENTUOK.—Dnring the week we have timbered the main south drift and run a crosscut west from said drift a distance of 10 feet in ore of milling value. Have been timbering in the npralse and putting in an ore chute. The joint east crosscut is in 111 feet; face in quartz and porphyry with bunches of good ore.

NAW YORK.—The npraise from No. 3 west crosscut, 800 level, is up a distance of 37 feet on the slope; the formation is quartz, showing spots of fair-grade ore.

Osceola District.

PAOMISING MINES.—Millard *Blade*, July 8: The El Dorado and Floride, gold properties located at Osceola, are reported looming up. The owners, Messrs. Joe Huff and Mayron Bixby, have had considerale development work done there of late, a tunnel having been run abont 350 feet to tep the main ledge in the El Dorado. This property assays $11.50 in free gold and hes a four-foot vein. Tbe Florida property is a fiue one and assays $36 to the ton in free-milling ore. A specimen from this mine was left at our office by Mr. Huff. It shows free gold to tbe naked eye. The owners are abont to sell out to a company and will no doubt receive a good price for their property.

Eureka District.

EURAKA PAOPLA DISCOURAGAN.—Eureka *Sentinel*, July 8: We have lived in thie town for 23 years and have seen great floods and fires here, but at no time dnring all those calamities have we seen the people so dispirited as at the present over the depreciation of silver.

Ruby Hill District.

BIO STAIKE.—White Pine *News*, July 7: A letter received here a few days ago states that e fabnlously rich strike wes made in the Grizzly Company's mine there. It seid they crosscnt the ledge 15 feet and exposed a body of ore that goes 10,000 ounces to the ton. Blocks of the ore, showing native and ruby silver, were on exhibition at the company's office which were wonderful to look at. The writer says the new find in Rnby Hill will rival the old Eberhardt in its palmiest days. Wbile the writer may have somewhat overdrawn the real truth in regerd to the strike, there is no doubt but a rich discovery has been made. Ruby Hill ore, when fonnd, has been always very rich. In corroboration of the fact thet an important development has been made there, we find the following in the Salt Lake *Tribune*: Isaac Jennings, president of the Grizzly Mining Company, its property being in Ruby Hill district, White Pine county, received a letter yesterday from Joseph G. Sharp, the superintendent, wherein it was stated that a vast body of phenomenally rich ore had been uncovered by means of a drift from the main sheft, and that tbe area of the vein so far as then known was 15x20 feet. A carload of the ore is to be brought in by July 1st. It will have to be henled by wagon to Oasis, 75 miles, and from there the Union Pacific will bring it to this city. The cost for handling and shipping the ore will be about $20 per ton, for milling $20 and for mining $10.

MONTANA.

AT BUTTA.—*Inter-Mountain*, July 8: The week has been a quiet one among tbe silver-prodncing mines of the district. Most of them have snspended operatione entirely, or are working a few men who are engeged in keeping things in repeir. The Alice and Moulton are keeping the mines pumped ont, and will thus be enabled to etart np agein at short notice. The copper prodncers of the district are all at work. The Anaconde, St. Lawrence, Wake Up Jim, Modoc, Monntain Con. and Green Monntain mines are in operetion with a full force of men at each property. The Never Sweat will soon be another producer for the Anaconda Co. The sbaft ie connected with the workings of the Anaconda mine, a new and commodions hoist has been erected, a large engine will ehortly be placed in position, and in a few weeks ore will be hoisted from the lower levels. A switch to the ore-house is now being conetructed. The Hnmboldt mine, near the Stella, is another of the new producers of the Anaconda Co. A new shaft-honse and macbinery have been placed on the gronnd and a force of men was put to work a couple of weeks ago. Sinking is now in progress, and a ledge of rich ore has been exposed.

THE ANACONDA.—During the week the sinking crew at the Anaconda mine has been engaged in cntting the station of the 1200-foot level. When this work is completed, croescntting eouth will be commenced and in all probability einking will be resnmed. At the St. Lawrence, miners are engaged in cntting the 1100-foot station. It is said einking will be temporarily euspended at this property. A few additional minere were put to work at the Anaconda dnring the week. The Anaconda ships about 35 cars of ore to Anaconda each day, and the other properties of the company are shipping about the same amount.

THE HEINZE PROPAATIES.—The addition to the Heinze smelter ie going up as fast as workmen can do the work, and by two weeks the two new converters will be in place. The new air compressor or blowing engine for the smelter will arrive early next week. The smelter is now treating about 120 tons of Glengarry and Rarue ore per day. At present the Rarus concentrating ore is being worked at the Butte Reduction Works. The liquidator is rnnning entirely on Glengarry ore, about 50 tons per day being shipped to the emelter. The Rarus mine is showing np better as work progresses, and the rich Glengarry is keeping up its record and is turning ont large qnatities of very rich ore.

THE LUCKY BOY.—Messrs. Leary and Weisman, who own some valuable copper claims in the vicinity of Camp creek, have made arrangements for the sinking of the shaft of the Lncky Boy in that district to the 100-foot level. This is not the claim owned by Patrick Mullin of Centerville, althongh of the same name and in the same district. Four men left Butte this morning for the pnrpose of prosecuting work on the claim, and the owners expect that at that depth tbey will etrike a pretty good ledge of copper.

THE NONE SUCH.—Messrs. McWilliams, Rnssell & Lacheppelle of this city heve made a rich strike in the None Snch mine, about two and a half miles from Homestake. The shaft on this property is an incline, and is only developed 49 feet. It bas peid expsnses from the gress roots down to that depth, and a few days ago a ledge of ore was uncovered which assayed 199 ounces in silver and $2.40 in gold to the ton. Work is being actively prosecuted at present, and a shipment of ore will be made during the coming week.

THE HOMESTAKA.—Owing to the vast amount of business which F. A. Heinze has to attend to in Butte, be recently decided to relinquish the lease and bond on the Homestake in Park canyon. Mr. Heinze did this, not because of lack of faith in the property, but from the fact that he bed two of the richest properties in Butte on his hands which would keep bis smelter running full blast. A few days ego the Shee brothers secnred e lease and bond on the Homestake, and next week will begin the work of development.

THE BARTIE.—F. H. Cooney and M. Donahue of this city have leased and bonded the Bertie mine at the heed of Horse canyon, and are now engaged in taking out ore which assays $50 per ton in gold. Machinery suitable for development work wes placed on the ground last week, and the lessees expect to make a World's Fair stake if not a fortnne. The shaft on this property is down 125 feet, and, as the ore is rich in gold, the lessees will probably develop it to at least the 200-foot level.

NOT SO BLUE AT GRANITA.—Relative to the situation at Granite, the Phillipsbnrg *Mail* says: "When it became known early last week that bar silver had takeu a tremendous drop, the news that came to close the Bi-Metallic works, Thnrsday morning, was not in the least nnexpected. The mine was eccordingly practically closed, followed by a ehut-down in the Granite on Satnrday night. With tbese mammoth properties idle—the bone and sinew of Granite's support—and conscious that other silver camps afforded no more cheerful ontlook for months to come, the miners, laborers and business men alike were heartsore. Many young men of means embarked for various perts—some to their old homes, some to agricultural and others to coal and copper fields. Every one remaining wore a gloomy face, which wae gloriously changed Monday by a telegram from St. Louis ordering Supt. Henley to start up the Grenite. Half shifts were accordingly pnt on in that mine yesterday morniug, which force will consist of all married men hitherto employed and a nnmber of eingle men—perhaps 175 all told. Ae the Bi-Metallic and Granite usually go hand in hand, it is hoped that the former mine will open shortly and give employment to over 100 men.

THE LEXINOTON.—The large Knowles pump at the 1200-foot level of the Lexington mine has been hoisted to the surface, and the pump at the 1000 will also be raised. It is the intention of the management to let the mine fill with water to the 850-foot level. Below this level there is an immense amount of drifts and crosscnts on the 1000, 1200, 1300 and 1500 foot levels, and it is estimeted that it will be at least six months before the mine fills with water to the 850 level.

UTAH.

PARK CITY.—*Record*, July 8: The Park City sampling mill wes closed down yesterday noon. The only mine banling ore is the Anchor and it is not shipping. John Frenton, foreman of the Apex mine, ceme out from Salt Lake last evening with inetructions to reduce his force to four men—just enough to keep the property in good shape. The mine-owners and operators of Park City have held one or two meetings lately, but no definite line of ection for the future has been mapped out. They are apparently waiting for results. The usual amount of prospecting is not being done this year and very few claime are being actively developed. The low price of silver bas apparently placed a damper on developments as well as on production. The Crescent is still closed down and nothing definite is known ae to its future policy. The damage to the air compressor has been repaired and that machine is now ready for active eervice whenever needed. J. M. Richardson is going steadily abead with the work of preparing his new cuncentrator for active work. General Manager Keith of the Silver King mine informed the writer this week that that property would not resume operations again until the white metal recovered and went above 80. He also said no improvements would be made at all, notwithstanding that many were needed and had been in contemplation. On the morning of the Fourth the Anchor Company placed a double force at work atoping first-class ore. The rock is being stored for the present, and just what the future action of the company will be as regards continning ore extraction and shipments hinges upon a meeting of the directors, which will be held in Park city in the near future, the gentlemen composing the board being expected to arrive dnring the forepart of next week. The concentrator has been closed down and will not again be etarted up until the silver market becomes stable at some point above 80 cents per ounce. The future policy of the Ontario Company still remains an open question, though something definite ie looked for early next week, when Mr. Chambers is expected to arrive in the camp. Several rumors are floating aronnd in reference to what the company proposes to do, bnt no credence is placed in them, for the boys expect an interview with Mr. Chambers before any line of action is settled upon. Upon the policy adopted by this company depends the future of Park City.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of snecial mention:

AETIFICIAL-STONE COMPOSITION.—Hugo Gallinowsky, S. F., assignor to the Pacific Compound Stone Co. No. 500,485. Deted Jnne 27, 1893. In the preparation of tbis compound the inventor uses natural hydromegnesite, boracic and oxalic acids, and the mother liquor of seawater, together with send or concrete, peraffine oil, tar or rubber bisulphide of cerbon end fiber.

LINE-HOLDAR AND GUIDA.—John H. Griswold, S. F. No. 500,491. Dated June 27, 1893. A familiar example of this class of devices is tbe stop-pulley of tbe cord of those curtains which are secured below, seid cord passing npward through tbe stop-pulley secured above and having its fall or extremity within reach of tbe opsrator. By pulling down upon this fall, the cord will slip through the pnlley, and will raise the curtein; and in order to hold tbe cord at any point it is deflected momenterily sideways, to bind in a suitable menner. To release it, it is bronght back to a central position and allowed to run through the pulley to lower the curtein. The object of this invention is to provide a simple and perfectly operating effective device of this class, which will allow the cord to be instantly released to move it, and perfectly held when necessary. This device can be applied not only to curtains, but for holding and gniding ropes, cables, cords and other descriptione of lines which, from the character of their employment, heve to be guided and held in desired positions.

SHOA-LACA FASTENAA.—Cornelia F. Hathaway, S. F. No. 500,497. Dated June 27, 1893. The invention relates to tbat class of shoe-festeners in which a clamp is fitted to and embreces the perts of the bow or otber slip knot, whereby the letter is prevented from loosening and nndoing. The invention consiets in a two-part or sectional frame of wire having eyes at one end whereby the parts or sectione are hinged and may be closed together or opened out from each other, and a clasp fitted to the free end of one part or section and adapted to engege and to release the free end of the other part or section. Tbe object is to provide a simple, neat and effective fastening for the slip-knots of shoe-strings.

CAN-HEADINO MAOHINE.—Milton A. Wheaton, S. F. No. 499,949. Dated June 20, 1893. The invention consists of certain improvements upon a can-heading macbine which was patented to tbe same inventor June 21, 1892, No. 477,584. Tbe new machine ae changed by the improvements differs from tbe former one by so altering the jaws and changing tbeir movements that the can bodies are first received into the open jaws, after which tbe jaws are closed before the can heads are admitted into them. After the jaws are closed, each one of tbe can heade is admitted to tbe jaws through a slot which is made through tbe jew which opens and closes. In the originel machine the can bodies and can heade were admitted to the jewe simultaneously while tbe jawe were open. In the present improvements tbe upper jewe in opening do not move toward or come in contact with each other as tbey would do if they were opened simultaneously in the origiual machine, and consequently e shorter can may be heeded in the improved machine than could be in the firet one patented.

PAUNING IMPLEMENT.—Daniel Behmer, Santa Rosa, assignor of two-thirds to Adolph Blaich, S. F. No. 500,526. Dated June 27, 1893. The object of thie invention is to provide a pruning sbears the blades of which are so connected together as to produce a drawing cnt when they are closed upon the article to be severed.

INJACTOA.—James W. Stanley, Oakland. No. 500,677. Dated July 4, 1893. The invention relates to that cless of injectors formed in graduated series, and it consists essentially in a series of removably connected nozzles with air chambers, said nozzles incressing in capacity of opening from the one which connects with the source of supply to the one which counects with the discharge. The general object of the invention is to provide an injector capable of regulation, according to the necessities of the case, and the particular object is to provide snch an injector as will regulate itself automatically in accordance with the power required.

Market Reports.

The Markets.

SAN FRANCISCO, July 13, 1893.

The face value of the coins made at the United States Mints in June and for the fiscal year will be found annexed:

	For June.	July 1 to June 30.
Double Eagles	$1,460,360	$20,444,460
Eagles	3,024,900	6,599,120
Half Eagles	85	2,987,925
Quarter Eagles	58	6,335
Standard Dollars	145	5,393,715
Half Dollars	396,573	765,578
Half (Columbian) Dols.	.....	2,501,052
Quarter Dollars	213,470	2,838,613
Quarter (Col.) Dols.	10,006	10,006
Dimes	19,014	1,101,972
Five Cents	35,012	598,785
Cents	38,202	487,317
Total	$5,197,825	$43,734,878

The amount of Standard Dollars coined last year is $3,000,000 less than for the previous year and $31,000,000 less than in 1890–91. This is due to the change in the treatment of Silver. Since July 1, 1890, the Government has stored its purchase of Silver in bars rather than coin, and thus saved the expenses of coining only such amounts as were thought to be needed.

New York Specie Movement.

The specie movement at New York from January 1st to July 1st was as follows:

	Imports.	Exports.
Gold	$6,757,770	$68,700,949
Silver	1,291,330	15,052,071
Total	$8,049,100	$83,753,020

Sub-Treasury Report.

J. P. Jackson, Assistant United States Treasurer at San Francisco, reports cash on hand June 30, 1893, as follows:

United States notes	$ 115,679 00
Treasury notes 1890	30,130 00
National Bank notes	53,395 00
Gold certificates	1,880 00
Silver certificates	259,580 00
Gold coin	21,754,783 00
Standard Silver Dollars	24,108,704 00
Subsidiary Silver coin	3,587,777 40
Minor coin	19,088 95
Total	$49,931,017 35
Standard Dollars shipped in June	$124,000 00
Fractional coin shipped	87,055 00

Mining Share Market.

The condition of the silver market keeps the silver mining stocks down so also proportionately as the metal. There is very little doing on Pine street. No news of importance has been received from the Comstock mines. As an illustration of how absurdly low some of the Comstocks have fallen during the scare, it can be said that the shares of the Bullion mine one day last week were quoted at 15 cents, or $15,000 for the mine, when the company had $19,000 in gold coin in the treasury.

The mining and milling companies on and around the Comstock paid the following sums for labor during the month of June: Andes, $1400; Belcher, $7124.33; Best & Belcher, $2135; Consolidated California and Virginia, $12,488.50; Challar, $2904; Crown Point, $4791; Confidence, $328; Challenge, $328; Consolidated New York, $1471, Gould & Curry, $2828; Gould & Curry and Best & Belcher shaft, $120; Hale & Norcross, $4841.75; Kentuck, $2008; Mexican, $2488.50; Nevada mill, $2755; outside quartz mills (estimated), $7000; Ophir, $2770.50; Occidental, $1720; Potosi, $13,476; Savage, $5129; Sierra Nevada, $2987; Segregated Belcher, $830; Utah, $1096; Union shaft, $1130; Ward, $1474; Yellow Jacket, $7695.58.

Although the banks connected with the San Francisco Clearing-house will grant no more overdrafts, the mining companies will be able to secure accommodation as before, but it will be obtained by giving the companies' notes, signed by the presidents and secretaries, for the amounts of money agree upon.

At the annual meeting of the stockholders of the Best & Belcher Mining Company, 70,000 shares were represented, and the following officers elected for the ensuing year: George R. Wells, president; Charles H. Fish, vice-president; and H. Zadig, E. B. Holmes and William R. Sherwood, directors. L. Osborn was re-elected secretary and P. Kerwin superintendent.

The Company of Associated Stock Brokers of the San Francisco Stock and Bond Exchange have elected the following officers: George T. Marye, J. M. Shotwell, H. L. Van Wycke, A. W. Foster and George C. Hickox.

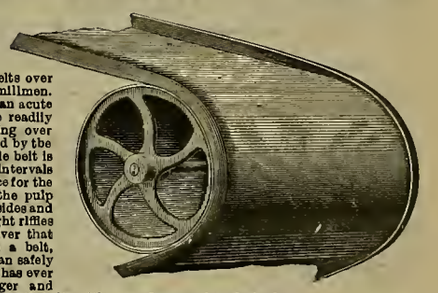
WASHINGTON, D. C., LONDON, ETC.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

MECHANICS' INSTITUTE PREMIUM.

S. F. MECHANICS' INSTITUTE MEDAL

To DEWEY ENGRAVING CO.

This Silver Medal was awarded for the fine display of HALF-TONE PHOTO-ENGRAVINGS in the Dewey Engraving Co's exhibit showing the progress of Half-Tone and Photo-Relief Engraving on this coast—the Dewey Engraving Co's Establishment being the first to introduce photo-engraving on this side of the continent, in 1877.

SUPERIOR ENGRAVING.—This able and reliable firm, through long and practical experience and thorough knowledge of the special requirements of all trades and classes desiring engravings on this coast, possess superior advantages in accommodating all Pacific States patrons of the Engraving Art.

Specimens of fine art and commercial work mailed free. Also estimates for any kind of engravings specified upon request. The very lowest prices for good and satisfactory service are offered with prompt and thorough attention guaranteed. Address, DEWEY ENGRAVING CO., A. T. DEWEY, Manager, 220 Market St.

THE McGLEW ORE CONCENTRATOR COMPANY.

{PATENTED May 5th, 1893.} CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. {FRANK BARBERE, Secretary.}

CAN BE SEEN IN OPERATION AT THE COMPANY'S WORKS.....132 MAIN STREET, SAN FRANCISCO, CAL.

NINETY-FOUR AND ONE-HALF PER CENT

—SAVED—

ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,

Including Prepared Canvas Belt.

FALLS MINE, Ioo, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. MCGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, & saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

MINE BELL SIGNALS

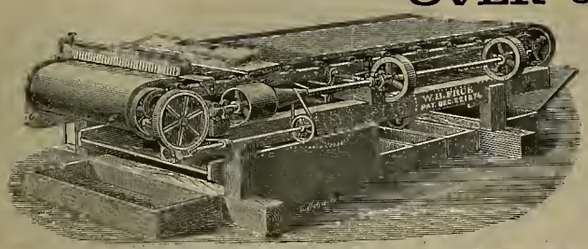
ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorbies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR,

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
68, 70 & 72 First St., San Francisco, Cal.

☞ SEND FOR CIRCULARS.

Drift Mines of the Forest Hill Divide.

In certain districts in the State the ancient channel system, together with its dividing ridges, was completely covered by a broad lava-cap or mantle prior to the starting of the modern channel system. There appears no definite indication of such a mantle in the district described by Mr. Ross E. Browne, in the State Mineralogist's report; on the contrary, the presumption is against it. Had the second period been closed by a broad, flat-topped lava-mantle, completely covering the earlier divides, one should expect to find the modern channel independent of the cement channel in its course, occasionally cutting and occasionally avoiding the same without a very definite guidance, and leaving as much of the old lava-capped divide as of the cement channel to form the present ridge. Such, however, is not the case on the Forest Hill Divide. The prospecting shafts and tunnels have invariably developed the existence of a trough-like depression under the volcanic cap. The ridge for 26 miles, from Tadpole to Peckham Hill, shows under the cap a practically continuous depression in the bedrock surface. There is good reason for regarding this as the main cement channel of the district.

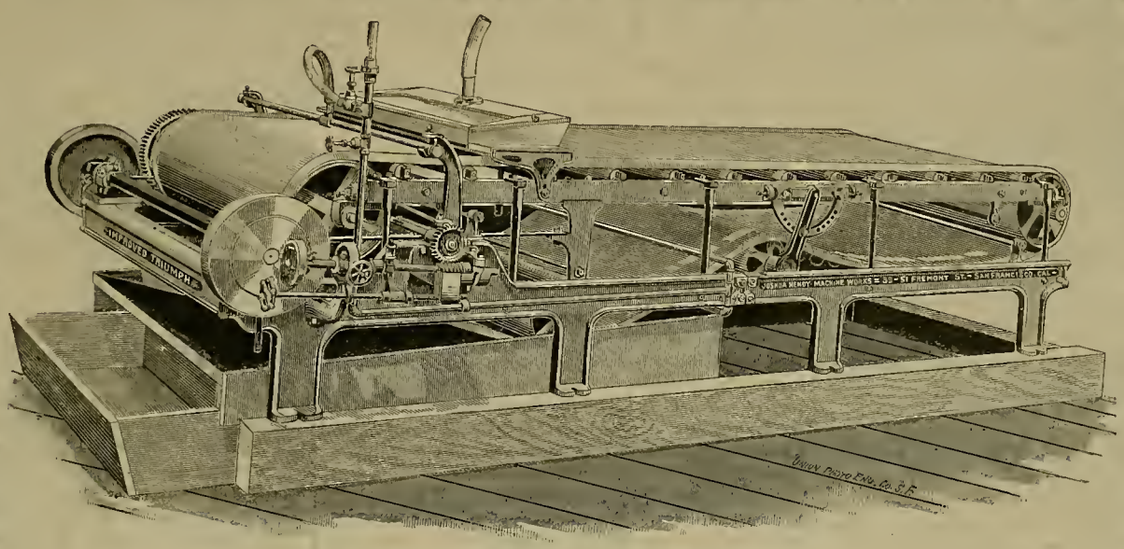
It is difficult to establish satisfactorily the cause which led the modern river to avoid the older cement channel to so marked an extent. In picturing the periods, it has been assumed that the old river bed, or rather the valley, was filled with volcanic material to a level high up on its widespread rims, but not to actual overflowing; that the thick volcanic mud formed a more compact conglomerate of the heavier debris in the central line of flow, and a lighter and more sandy cement toward the shore lines; and that these conditions tended to divert the streams toward the marginal lines of the deposit. The streams would necessarily cut across the deposit at the junctnre of the volcanic-capped tributaries.

There is offered no definite evidence in support of this assumption. It is made, in defanlt of a better one, with the view of impressing the fact that the old cement channel has been avoided, to a notable extent, by the channel of the modern rivers.

It is plain, however, that the construction of the ancient systems is very far from being so simple.

The following section (Fig. 8) shows the height of the present bedrock ridges. The rims of the old river bed have not yet been developed.

Owing to small irregularities there is required the development of a considerable length of the channel to determine satisfactorily the average grade. However, disregarding the smaller tributaries, the exposed sections show, as a rule, a fair uniformity of grade—certainly as great a uniformity as the modern river beds. The accompanying longitudinal section of the divide shows the grades of the summit-line, and of the ancient and modern channels, and the depth of erosion. The course of the ancient river was more sinuous than that of the ridge-line, hence the grade in the section is somewhat greater than the actual grade.



IMPROVED "TRIUMPH" ORE CONCENTRATOR.

Improved Form of "Triumph" Ore Concentrators.

We herewith present an engraving illustrating the recently improved form of the "Triumph" ore concentrators, which shows the improvements which have been introduced into their construction, by which it is believed that certain advantages are gained over other styles of vanners or concentrators.

These advantages are obtained by reason of the fact, as will be observed from the cut, that the crank-shaft is now placed and fitted at the head of the concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting-rod, and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brasses have also been very much improved, making them stronger, simpler and more easy of adjustment.

Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all of the parts of the machine stronger, more accessible and as easy of regulation as is possible.

These concentrators are built by the Joshua Hendy Machine Works, No. 51 Fremont street, this city, and are furnished with either the plain or "Blasdel" riffled belt, as may be requested.

One of the improved form, set up and ready for operation at their office, can be examined by mining and millmen at any time.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 63.

Comment.

They had a miners' meeting up at Park City, Utah, the other day, to decide whether the miners of the Ontario and Daly companies would accept a reduction of 20 per cent in wages or quit. Mr. Chambers had a talk with the men at the mines and told them if they would accept a reduction the mines would continue to work; otherwise, as the companies are losing money, it would be necessary to close down. At the meeting a large number of the men took part in the discussion and every speaker was listened to with fair attention. Some were in favor of no reduction whatever nor of listening to any reason why a cut should be made, while others cautioned moderation and maintained that the conditions were extraordinary, and that what the mine officers had to say should be given due consideration and carefully weighed. The two factions clashed rather harshly several times and some sharp language passed between many of the men. The discussion lasted for more than two hours and the chairman was quite often taxed to the utmost limit of his resources to maintain order and guide the meeting to a successful termination. Finally a committee was appointed to wait upon Superintendent Chambers and lay the case before him in plain and concise language, that the men had decided to accept no reduction, and demanded the old wages or nothing. Afterward a second meeting was held and the committee was authorized to go uninstructed to Mr. Chambers, which was much the wiser plan on the part of the miners. A quarrel with bread and butter in a mining camp in these trying days is a very foolish proposition. The miners ought to encourage owners to keep the mines in operation, even at some cost to themselves. This is much better than to see them shut down entirely.

The sweeping reduction in salaries and expenses about to take place on the Comstock comes none too soon. The salaries of officials should have been cut down some years ago. The whole outfit has been running on a top-heavy system which has nearly wrecked it. Some of the stocks have been selling lately a rate for a whole mine of less than the mine really had in the treasury. There have been in many instances, some of which we have quoted, more officials than working miners employed. Now not only the officials but the miners must feel the pinch, for wages as well as salaries are to come down. As will be seen by a statement in our Mining Summary in another column, there are now only 325 miners at work on the Comstock at $4 per day. It is thought, if they will accept $3 per day, 1000 men can be put at work. It is pretty certain that this reduction will take place. As there are so many idle miners in the country, there are plenty who will be glad to get the $3. They are all in want of employment. The Miners' Union has doubtless seen this coming for a long time. The members will naturally not want to accept this reduction, but it is better for them to do it than quit work altogether. The Comstock mines have such a good proportion of gold in their ore that they can be worked under more favorable conditions than most silver properties. But they cannot, under present circumstances, keep going on any extensive scale and pay the salaries and wages now being paid. The question has been put off long enough, bnt must now be faced. The salaried officials have signed an agreement, and other reductions are expected to follow.

The silver situation, as far as it relates to mining, could not be much worse than it is. Silver mines, mills and smelters have shut down in all the principal camps and districts of the country, and thousands of men are out of employment. There is, moreover, no immediate prospect of mines or works starting up again. Congress cannot settle the matter in a week, and even then may not settle it to the satisfaction of the silver-mining community. Of course the closing down of the silver mines and reduction works exercises a widespread influence in the regions where they are, and thousands of people not directly connected with the industry are affected. Conventions, mass meetings, leagues, etc., are considering and discussing silver all over the West, but their deliberations are looked upon as not carrying great weight by reason of the participants being directly interested in silver production. All they can do is to present their side of the question to the general public. The matter will rest with Congress eventually. After the great Silver Convention in Chicago, its members will adjourn to Washington, to be on hand when Congress convenes. The real fight on the subject will commence then. What is being done now is merely preliminary; a sort of skirmisbing before the great battle in Washington.

Some day the placers along the Santa Maria, near the bonndary line of Yavapai connty, will he worked profitahly hy means of improved machinery. Where men are now panning out the golden dust, soon hydranlic jacks will be in fnll blast. There is a large extent of country along this stream which is rich in anriferous gravel.—Mohave County Miner (A. T.).

This paragraph is from a paper which always has a column or two of well-prepared mining news about the various mining camps of its vicinity. If such a paper supposes auriferous gravel to be worked by "hydraulic jacks," what must be the idea of hydraulic mining held by papers printed in agricultural regions. There is a very decided difference between a hydraulic jack and a hydraulic nozzle. A jack could lift a very heavy weight if properly applied, but could not do much with a gravel bank. The definition of hydraulic mining in the California Code is as follows: "Hydraulic mining, within the meaning of this title, is mining by means of the application of water, under pressure through a nozzle against a natnral bank." We have more hydraulic mines in this State than anywhere else in the world, but we have not yet been able to move those auriferous banks by means of "hydraulic jacks."

We have before referred to the prospecting operations in a cross-channel of the Mayflower mine on the Forest Hill divide, Placer county, where they are boring through the lava and gravel with an ordinary artesian-well apparatus. We learn this week from Mr. Chappelet, president of the company, that the fourth hole bored is now down 375 feet. They recently passed through eight feet of "nigger-head," which is a very hard material, as most miners know. Mr. Chappelet says every one was surprised at the tools being able to pierce this material as well as they have. They are confident now that they can get through anything they meet. Where boulders are met, blasting is resorted to, otherwise they bore right along. This system of finding the depth and centers of gravel channels under the lava cap has often been suggested, but this time practical experience shows that it is not only feasible, but cheap. The expense is comparatively little. Four men carry on the work in two shifts. They are not only prospecting the channel, but one of the holes will ventilate the main tunnel of the Mayflower. This mine is now paying very well, the gravel in the channel being of high grade.

A Gold Run correspondent of the Placer *Herald*, in discussing the necessity of the resumption of hydraulic mining, brings to the argument some very surprising figures. He says:

"California at one time produced one-third of the entire gold of the United States; thus, by our mines being closed, one-third less gold is coined in the United States. In 1880 this State alone produced $10,000,000 in gold; this went floating over the entire world. Last year she produced about $600,000 in gold, a difference of $9,400,000. As a matter of fact that much less was coined and more gold was leaving our conntry than was coming in. In a period of 45 years California sent rolling through the world $1,300,000,000 in gold, nearly all taken out by hydraulic mining. Cnt off this enormous amonnt, and is it any wonder we are financially depressed?"

There is not a figure in this statement which is correct except as to the total amount of gold produced, and even a statement in that connection is wrong, for this was not nearly all from hydraulic mining. The surface placers and quartz furnished most of it. In 1880 this State produced $20,030,761 in gold; it has never got down as low as $10,000,000, even with the hydraulic mines closed. The gold product of California last year was $12,571,900, not $600,000, which is quite a material difference. The very first sentence in the statement is misleading, for the correspondent says: "At one time California produced one-third of the entire gold of the United States." The fact is, this State still produces over one-third of all the gold of this country. Out of the $33,000,000 gold yield of this country last year, California produced $12,571,900. Such figures as those in the *Herald's* letter are worse than useless and do no good to the hydraulic-mining cause. Matters are bad enough without useless exaggeration.

We may expect more news of strikes in gold properties in these days, because so many miners are now prospecting for the yellow metal. Even in the silver States gold is now receiving the most attention as far as mining is concerned. Miners everywhere are hunting for it. In many instances there will be exaggeration of values, because men not accustomed to gold-mining are apt to get excited over a few rich specimens or a dozen or so colors in a pan. Those old in the business, however, know that it is the average which has to be looked to, and pay little attention to a glittering specimen.

It is impossible for the PRESS to publish the proceedings of the various meetings and conventions held of late in favor of silver. The result is similar in each case—the adoption of resolutions in favor of free coinage and against the repeal of the Sherman Act unless other favorable legislation takes its place. Some of the resolutions adopted have been in very vigorous language, by which the West threatens the East. Whether action of this sort helps the silver-mining business is questionable, to say the least. The speeches in Colorado have been particularly fiery. If many of the delegates have the ideas which have been expressed at some meetings, the silver convention at Chicago before Congress meets will be rather a lively one.

The Chief of the Bureau of Statistics reports that the exports of gold from the United States during the twelve months ended June 30 amounted to $108,689,844 and the imports to $21,174,381, an excess of exports of $87,506,463. During the preceding year the exports were $50,195,327 and the imports $49,699,454. The exports of silver for the year ending June 30th were $40,737,319 and the imports $23,193,252, an excess of exports of $15,544,067. During the preceding year the exports were $32,810,559 and the imports $19,955,086, an excess of exports of $12,855,473. These figures show that our exports of the precious metals are very greatly increasing, especially the gold. Our domestic production of gold is now only about $33,000,000 per annum and if this export proportion keeps up it will not take long to rnn our stock of gold down very low. It is evident that we are buying too much abroad, for this gold goes for foreign purchases.

The California Debris Commission.

The members of the California Debris Commission, appointed by the President to carry into effect the Caminetti Act, left this week for a tour through a portion of the hydraulic mining regions of this State. They will go to Placer, Nevada, Yuba, Butte and Plumas counties, and examine both large and small mines. The object of this trip is to meet and confer with the practical working miners at their mines, examine into the conditions existing, and ascertain if possible why no applications for license to mine by this method have been made.

The fact is that, although the commission has been organized for work for the past six weeks, thus far not a single application for license to mine, in proper form, has been made. Several miners have applied to mine, but none of them have accompanied their petition with the instrument required by the law granting to the Government the right to regulate method of impounding the debris.

So instead of the Commission being overcrowded with work, it has none at all to do. To find out the reason of this is one of the objects of the members of the Commission taking this trip through the mines. Particular inquiry will be made among the smaller hydraulic mines, and the men will be given an opportunity to talk personally with the Commissioners if they desire.

The Commission will doubtless find that the main reason why the miners do not apply for a license is that they have no money to build dams. Their business has long been nnder the ban, and they have become impoverished. Moreover, there is some doubt as to the character of the restraining works which will be required by the Commis-

sion. Some men suppose a $20,000 dam will be required or a $10,000 dam, but this is absurd. The Commissioners cannot tell on advance of application for license what kind of a dam is needed. It is the duty of the miner to describe his proposed works, and the Commission will pass upon the plan. They will naturally regulate this in proportion to the magnitude of the claim and the amount of gravel to be washed. They are not apt to order dams out of all proportion to the profits to be made by their use. It was not appointed to annihilate hydraulic mining, but to rehabilitate it, and will doubtless try to do this and aid the industry as far as is consistent with their other duty of preserving the navigable streams.

Gold Mines

Gold mines, claims and prospects are now forcing themselves to the front all over the Western States and Territories. They have long been neglected because fewer sudden and great fortunes are made in them than in silver mines. Twenty or thirty years ago the gold-miner was the man of fortune; but of late years the bonanza millionaires have been those whose fortunes have been made in silver.

But with the fall in value of silver there comes a change in this. The silver-mining industry has received a blow which will never permit it again to occupy the position it has held. The metal itself has got into politics, which is bad for it, as this is bad for individuals. Should the action of this country and other nations again raise the value of silver, there will be no way of predicting when a change may be made at any time, or what the results may be. There will always be more or less doubt about the advisability of putting large sums of money into silver mining for fear of some such change, and silver properties are not likely to bring former prices under these circumstances. This is not a pleasant conclusion to reach, and it will be denied by many, but it forces itself to consideration under present circumstances.

One difficulty with gold mines in the past has been that because it was gold being mined, people supposed all sorts of extravagancies could be indulged in. In this State we found out the fallacy of this position many years ago, but in other regions where gold mining was newer, the same experience had to be gone through.

In working a gold mine, experience has shown that the utmost care must be taken in attention to details to prevent loss. As a general proposition there are few of these mines which carry large bodies of very rich ore. Where the ore is very rich there is comparatively little of it, and ledges with rich bunches are usually of a pockety nature and not at all steady as to product. It is the large ledges of ordinary ore which pay the best. It is surprising how low a grade of ore can be made to pay in these days. This class of mining, when conducted on a proper system and with economy, pays very well, indeed. In California gold-mining is carried on as a legitimate industrial proposition, just as wheat-growing or manufacturing. There is little, if any of the speculative feature left.

Speculation in mining has been mainly confined to silver properties on this coast for a long time. Not half a dozen California gold mines have appeared on the list of stocks dealt in by our mining exchanges. As a speculative proposition or stock-dealing operation a gold mine is found to be of little use to the brokers or dealers. They can do much better in silver, so that silver has always had the call on the stock boards.

People who have supposed that because of the Pine-street mining stock speculation in this city California mines were largely dealt in, are mistaken. Most of the stocks represent Nevada silver properties. The gold mines of California which are being worked are operated by companies or individuals and the stockbrokers never hear of them.

But the gold mines of this State have been heard of outside our borders and their value is better appreciated elsewhere than by the citizens of our metropolis. For instance, here is an item from the Mohave County *Miner*, published at Kingman, Arizona:

> Quite a number of White Hills miners came in Saturday night and have gone to the gold fields of northern California, and many more will soon follow their example. The gold fields of Arizona will support quite a large population when they are opened up, but at present they are in a state of neglect and very little work being done. In and around Cerbat there are many valuable mines of gold-bearing rock that could be profitably worked under the right kind of management. Ore that will mill from $10 up in gold can be found in abundance, and if silver fails to go to the front these mines should be worked or this part of Arizona will have to be given over to the buzzard and coyote.

Here are miners who are coming from a region where there are undeveloped gold claims to a State where such mines are being worked, or where, if they find available prospects, there is now a chance for a sale.

The gold belt of this State is very extensive but it is by no means opened and developed. There are hundreds and hundreds of known claims only partly developed, and some thousands of "prospects" which may become mines if money is expended to prove their worth. There is no mining field in the United States where there are such opportunities as can be found here. The miners and prospectors, however, need the aid of capital to develop these properties, and it is evident that this aid will soon be at hand.

The Hydraulic Miners.

There was a meeting of the executive committee of the State Miners' Association last week, which has stirred up the anti-debris men and brought forth the usual batch of resolutions from the Anti-Debris Association. The Marysville *Democrat* dignifies the mining committee meeting by naming it a "convention." All sorts of things are reported as having been done at this meeting, among others that there is an organized movement by the miners against the dams, against filing a petition, against the penalty clause, and against the whole bill.

Now the fact is, the executive committee of the Miners' Association met last week and discussed the new law, but no action was taken with relation to asking for amendments to it, reports to the contrary notwithstanding. Members of Congress were asked to be present, as their advice was desired in the matter of making the law operative, which it apparently is not now, as nobody has properly asked for a license to mine under its provisions, although they all want to get to work.

It is found that few of the smaller miners have the means to build dams. They are also in doubt as to the character of the dams which will be required and are waiting for the first few to comply with the specifications of the engineers. Moreover, there are some questions as to the instrument demanded by the law on relinquishing to the Government the right to specify the character of the restraining works, it being supposed by some that this would throw a cloud over the title.

It was these matters which were discussed by the members of the executive committee, and a committee was appointed to devise and report on some means to overcome the difficulties in the way of seeing this new law put in practical operation. This committee is still at work and has not reported, so that no definite action has been taken by the association.

It may be said that the hydraulic miners of this State do not expect or intend to dump their debris so that it will interfere with or injure the farming lands or navigable rivers. The time for that sort of thing has long gone by. They must restrain the debris whether they want to or not and are trying to find some way by which they can do it. No steps will be taken by the miners which will injure the navigable rivers or farms. If any attempt should be made to amend the Caminetti law it would probably be in the direction of making it operative, not nullifying it. The fears of the opponents of hydraulic mining are entirely groundless in this respect.

Coast Industrial Notes.

On Saturday last the flour-mill and warehouse of the Fresno Milling Co., at Fresno, were destroyed by fire. The loss is $139,500; insurance, $48,000.

The Uncle Sam Gold-Mining Company has been incorporated with $10,000,000 capital stock in 100,000 shares. The directors are D. B. Hunt, Thos. Edgar, E. Wilson, Geo. P. Gillis and Fred Frankenthal.

A telegram from The Needles states that $450,000 worth of bonds of the Nevada Southern Railway branch line from Goff's have been sold in New York, and it is thought the work will be pushed on to Pioche and Goode Springs at once.

The wholesale wine firm of Lachman & Jacobi is to be turned into a company. The capital stock is placed at $1,000,000 in shares of $100 each. Directors: Frederick Jacobi, Abraham Lachman, Jacob J. Jacobi, M. S. Eisner, Samuel M. Newmark.

Charles Bernard of Carlin, Nev., is soon to begin work on his marble mine or quarry near that place. Mr. Bernard sent some samples of the marble to Salt Lake City and they took as high a polish as the finest quality of Italian marble. The quarry is situated on Maggie creek and is quite near the railroad.

A partial organization has been formed at Redding to sink a well in Buckeye township to prospect for gas and oil. A committee was appointed to select a spot at which to bore. A fund has been raised at Redding for the purpose, and if indications amount to anything oil and gas will be found. Fifteen hundred dollars has been subscribed.

Work has been commenced on the grading for the new power-house of the Mission-street and Potrero electric roads, controlled by the Southern Pacific Co., under the names of the City Railroad and Southern Heights and Visitacion Valley Railroad Companies. The new power-house is to be at the junction of Bryant, Channel and Eleventh streets.

On Wednesday night they had a disastrous fire at Susanville, Lassen Co. Sixty houses were burned. Not a business house was saved, with the exception of one eating-house. All the stores are a total loss except that of Sol Nathan, who saved one-half of his stock. The loss is about $250,000, not over one-fourth covered by insurance. Five entire blocks were burned. There were no casualties.

The stockholders of the California Electric Light Company were well represented at the annual meeting. Out of 50,000 shares, 42,000 were represented. The old board of directors was re-elected without the least opposition. The board consists of George H. Roe, Gustav Sutro, John S. Spring, D. Marcucci, Arthur W. Moore, P. B. Cornwall and William Kerr. The directors organized and elected the following-named officers: Pres., John R. Spring; Vice-Pres., George H. Roe; Sec., J. R. Green; Treas., The Nevada Bank.

Delegates representing 248,000 coal miners in various parts of Great Britain met in Birmingham, Wednesday, to consider the proposal of the mineowners to reduce wages 25 per cent. After a lengthy and heated debate a resolution was adopted declaring that the conference was opposed to the reduction. No decision was reached on the question of a strike if the mineowners persist in the intention to make the reduction. The strike, should one occur, would be the largest movement of the kind that ever took place in the United Kingdom.

The Mint Bureau succeeded in getting offers of silver in Washington on Wednesday at what it considers a fair market price—71½ cents per ounce. Four hundred and fifty-four thousand ounces of silver were offered for sale to the Treasury on that day at .71500 to 73. Seventy-five thousand ounces were purchased at .7150, the balance being declined. This makes the total purchases of silver for the month thus far 1,023,000 ounces. The gold reserve has recovered the ground it lost Monday and again began its climb toward the $100,000,000 mark.

At Leadville, Colo., orders have been received to take out the pumps from the great Maid and Henrietta combination. The shaft is nearly 1000 feet deep. Pulling up the pumps means the entire abandonment of one of the largest silver-producers in the State, with prospects that the water will rise to within 300 feet of the surface. This means that every drift and level will be flooded, entirely ruining the present workings, upon which $1,000,000 has been expended. Flooding the mine also means flooding the properties lying below it. It is impossible to estimate the damage it will cause.

The internal dissentions that have brought the San Francisco and San Mateo electric road so prominently before the public lately are in a fair way of being terminated. The business of the road is good, and the mechanical operation as well as the physical conditions are satisfactory, and all in all the troubles besetting the men who have risked much in the enterprise seem to have reached a turning point. The profits have averaged $5000 per month for the past six months. Branches are to be built to Golden Gate Park and to Baden when the stockholders and creditors settle their differences.

The new electric road on Twelfth street, Oakland, was put in operation this week, and cars will be run regularly from Twelfth and Broadway to West Oakland. The cars ran very smoothly over the route, and the road is pronounced a success. The single fare each way will be five cents. This road will now make lively competition between Broadway and West Oakland, as four lines now parallel each other. There is an electric line on Eighth street, one on Fourteenth street and another on Sixteenth street. The power for the new line is furnished by the Oakland Consolidated Cable Company.

The various departments at the Mare Island navy-yard are busily engaged in getting up plans and estimates for work proposed to be done during the coming year. From appearance it would seem that considerable will be done in the way of improvements at the navy-yard. A number of projected plans will be submitted to the department for approval and recommendation made that they be adopted by the next regular session of Congress, tending to increase the efficiency of the already efficient plant. Not the least will be the request for another dry dock, to be located near the site of the present magnificent structure, which may well be said to be one of the very best in the country.

At San Bernardino, Judge Campbell of the Superior Court has refused to dissolve the injunction in the suit of Alice Marlett, administratrix, against the Bear Valley Irrigation Co. Plaintiff owns a timber claim through which the Bear valley people began to dig a ditch for the purpose of conveying water to the Alessandro tract. Damages were demanded, but were refused by the company as they were deemed excessive. The company then undertook to construct the ditch without the permission of the owners and the authority of the court was invoked. The ditch being constructed will cost several hundred thousand dollars, and the granting of the injunction is a serious matter not only to the company, but also to the users of water.

The Metropolitan Railway Co. has received the first four electric-cars of an installment of ten which the Carter Bros. Car Works of Newark are building. The new cars are of the double-ender pattern, with the front and rear dummy both open and capable of seating eight persons on each. The cars are much larger than those now in use on the Metropolitan system running from Powell and Eddy streets to the park. Wendell Easton, president of the Metropolitan Railway, said that it was the intention to improve the service, and that additional machinery would at once be placed in the power-house, and with the additional power the running-time from Market and Eddy streets to the park would be shortened from 24, as at present, to 20 minutes.

Three of the ice houses at Prosser Creek, Nevada county, have been destroyed by fire. These houses were filled with ice, about 8000 tons in each, and the loss in each will amount to about $60,000, while the loss to the buildings will be equally as much more. This will make the supply of ice very short this season, as it had been predicted that the demand was going to exceed the sup-

ply. Just what effect it will hsve on fruit icing is unknown, as the Union Ice Company had intended to supply their orders for export sbipments from these houses. The People's Ice Company hss shipped out of their houses some 600 cars. The Tahoe has emptied one house of 8000 tons and still hss one filled. The Old Floriston is open now and tbey are shipping ice out. It contained some 8000 tons, while their new house has about the same amount. Tbe National Ice Company has about 8000 tons in tbeir house and Rocky Run will ship about 5000 tons.

AFTER Mondsy next, tbe hours of the men in the railrosd sbops at Ssersmento will be reduced from nine to eight, as a measure of economy and to esve laying some of the men off. One of tbe officisls of the Southern Pacific says: "The compsny hss given out orders to cut down the expenses 25 psr cent. This should not be understood to mesn, however, that the compsny's force is to be cut down that per cent. The company sets sside so much of its receipts for betterment work—that is, for improvements that are not imperative, but yet would incresse the value of the company's property if msde. The compsny hss felt the effect of the stringency in the money market just as otber lines of business have felt it. It hss found a scsrcity of gold with which to meet the demands of otber roads, etc., and those of creditors generally. Yet tbe business of tbe compsny shows that the receipts are good. The difficulty expcrienced by other firms in getting gold to meet payments is whst has sffected tbe company and brought about tbe present order respecting expenses. That it is to be but temporsry in effect I sm certain."

THE ownership of the waters of Carson river, Nev., is now the subject of a very important lawsuit. For many yesrs Csrson river hss furnished the motive power for driving the mills crushing the ores for the Comstock mines. Of late years, however, the waters of the river have become of great value for irrigating purposes, and in consequence an irrepressible conflict has grown up between the farmers and the millmen. The Union Mill and Mining Co., a corporation controlled by the Sbaron estate, hss brought ejectment suits in tbe United States Circuit Court sgsinst 105 fsrmers of Ormsby county, Nev T. D. Edwsrds has been appointed a commissioner to tske testimony, and the hesring hss been going on for several dsys at the offices of W. S. Wood, Nevads Block. Tbis csse is a test one, as the present action will also determine the rights of the other milling companies. T. W. Coffin, of Virginis, Nev., snd W. S. Wood, of this city, are the sttorneys for the mill companies, wbile ex-Attorney-General R. M. Clarke and W. E. F. Dsal appesr for the farmers. Both sides claim prior sppropriation of the water. Ten years ago tbis suit would have excited profound interest in this city, but tbe decline of mining on the Comstock hss enormously decreased tbe importsnce of tbe Carson river to the mining industry.

MR. F. M. SMITH, known here as the "Borsx King," tbis week assumed control of the Oskland Consolidsted Street Rsilway. A special meeting of tbe directors wss held, st which Msyor McElrath and A. T. Eastland retired and A. H. Clough and W. H. Chickering were elected to fill the two vacancies. Mr. Chickering is Smith's attorney and Mr. Clough is his secretsry. The directory of the road is now constituted of W. H. Martin, G. W. McNear, J. W. Coleman, W. H. Chickering and A. H. Clough. This is but the final step in a long series of deals in the stock of this road, by which the control passes absolutely to F. M. Smith, wbo uow alone holds 10,000 sbares more than one-half of the stock of the road. The Oakland Consolidated is one of the most prosperous systems in Oakland. The main line commences at Second and Brosdway and runs tbence to Franklin street, thence to Tbirteenth, thence to Grove and thence to Forty-fifth street. Here the road branches and makes a loop, tsking in Temescal, Berkeley and Lorin; tben there is another branch rosd which goes to Mountsin View Cemetery. The third hrsnch leaves tbe msin line at Sixteenth street snd runs to the Sixteenth-street ststion. Recently anotber new branch was placed in operation, whicb leaves the main line at Grove and Thirtesntb streets, snd runs thence down Grove to Eighth, to West Oaklsnd. The system is a very complete one and tbe rosd is said to have been a psying investment from tbe start. Smitb and his collesgues still have another big scheme in view. It is proposed to build an electric road from Piedmont, to start from tbe foothills down to Emeryville to connect with the new ferry to be established. Tbe syndicate is said to have tbe absolute control of 25 miles of street railroads and the option of 10 miles more. There are many plans on foot for a great ferry scheme, but the promotors are not yet ready to give their plans in detail. All the roads that bave heen secured by the syndicate are so arranged that the psssengers can easily be transported to Emeryville. It is said, on very good authority, that it is proposed, wben all the deals are consummated, to establish a great ferry system bstween Emeryville and San Francisco. A passenger will be taken from the center of tbe town to San Francisco via Emeryville for less money and in sborter time than is now done by the Southern Pacific. The syndicate, with its $6,000 000 or $7,000,000 capital, proposes to do great things for Oaklsnd, so it is said. The roads in contemplation will be built if satisfactory franchises can be secured from the County Supervisors.

Electric Haulage in Coal Mines.

The problem of economic haulage in coal mines has lately received considerable attention from mine owners, who have found the expense involved in haulage alone much greater than in their opinion it should he. The mule has had his day as the principal factor in the haulage question, and the cable is under test, with results more or less satisfactory. The electric locomotive for mine work is comparatively a new-comer in the haulage field, hut it has already acquired considerable prestige and hids fair to supersede hoth the mule and rope haulage.

An excellent example of the work done by the electric locomotive in coal mining is shown at the Rock Springs coal mine, at Rock Springs, Wyoming. This plant was installed by the mining department of the Northwest General Electric Company, and is described in the *Electrical Review*.

About a mile from the mouth of the mine the horse power station, containing a dynamo of 80-horse power driven by a steam engine, is located. Current from this is delivered at a pressure of 550 volts, which allows of a drop of about ten per cent between the power house and the mine.

The feed or supply wire is No. 000 hard drawn bare copper, making a complete metallic circuit. The trolley line is furnished with a circuit breaker about 30 feet from the mine mouth, so that the current may be cut off from the mine when the locomotive is employed for switching purposes outside.

The locomotive used is of the G. L. M. General Electric Company type, of 30-inch gauge, 60-horse power. Its usual speed in this instance is about eight miles an hour. The cars used are of the ordinary coal mine type, weighing each, when filled, about 3000 pounds; when empty, about 1000 pounds.

The economy attained hy the use of this locomotive is str k'ngly illustrated by the fact that by its aid 30 cars were run from the loading point to the end of the track, a distance of about 6000 feet, there dumped and returned to the mine in 20 minutes. On another occasion the locomotive drew after it 30 loaded cars and pushed ahead 16 others from end to end of the road without difficulty. The track is built of 35-pound T rail, and has several switches and spurs necessary to the rapid handling of the cars.

It is not inapropos here to quote from a letter from an expert, giving an account of contact with the hare wire and the results thereof:

"Several men have heen shocked since our plant began operating, hut the effect is only momentary, and they only laugh at it. The result has simply heen to remove all fear they had of it. As I stated in my letter, this is a very dry mine, and so the only way one can get shocked is to stand on a rail and touch the wire. I have been shocked several times myself while handling the locomotive, through carelessness. The other day a balky mule ran right into the wire with his head He was knocked down. He got up and ran into it again three times, and was dropped in every instance. After that he simply turned around and walked off to his work. I ought to remark that the shock does not knock a man down or burn him. The only description I can give of its effect, from personal experience, is a tingling sensation, lasting, in the heaviest shock I received, not more than two minutes afterward in the hand that made contact."

This last is a fact which should reassure mine owners who have any fear of danger from contact with the trolley wire. The element of danger once recognized as entirely absent, the electric locomotive can compete on equal grounds with any other system of haulage, with many points in its favor which cannot be urged by its competitors. We expect to see its adoption become general, hoth on account of the economy of its operation as well as its convenience of manipulation.

A Letter from an Old Miner.

Whisky Creek Mining District, Shasta County.

TO THE EDITOR:—In many places in California, no doubt, there are certain mining fields which, for some cause unexplainable, remain unworked and unexplored. And, perhaps, within the entire State there is no other place with the surface mineral showing that Whisky Creek Mining District has, hut what has had done, or is now having done more work in the way of prospecting and developing, than has been done here. With the exception of one or two claims this is a dead camp, so to speak, while on every hand there are favorable showings for rich and permanent mines.

There are also in this camp several quartz clalms which are fairly opened, and tapped at from fifty to one hundred and twenty-five feet, that are now underworked, and things around them as silent as the grave. This, in some instances, is not because the rock is not rich enough to pay for working in some form or another. In this regard your correspondent knows of one particular claim on which a well-to-do farmer of Sacramento valley expended some four thousand dollars in the way of development, and has on the dump considerable good free-milling ores. Not long since, the farmer concluded to shut down bis mine, and, if possible, try to sell the same. To-day the claim has the appearance of an ahandoned piece of property.

Now, the claim is well worthy of different treatment. It is tapped hy tunnel and shaft about 125 feet, and the ledge at this depth is something near four teet in width, and is stoped out each way sufficiently to show that the ore found in it is not a mere pocket. It is safe to say the rock will mill twenty dollars per ton, and it is a fact that the rock is richer at this depth than it is nearer the surface. I only mention this particular instance to show the alarming *ennui* there seems to exist in running affairs not only in this hut in other mining fields. What this camp needs is new life infused into lt. There is a chance here for capitalists to invest a little of their cash with a fair prospect or reaping a rich harvest in return, and I have no doubt there are other camps in the same predicament.

This mineral belt is the same as that of Old Diggings, French Gulch and Deadwood. It is a large porphyry belt, running northwest and southeast. At this particular locality in it the creeks and gulches have been very rich in quartz gold, and in some places the gold leading up to quartz, its mother deposit; while at the head of this creek is that rich and strange quartz deposit known as the Bangheart mine, a thorough description of which was published in the MINING AND SCIENTIFIC PRESS several years ago. Near this old Bangheart mine is a claim that in former years paid handsomely, but which is now idle, and, in fact, the old mill put up on this claim many years ago is just now being hauled away to another mining section. The claim alluded to is known as the Mad Ox. Now, the supposition naturally arrived at is, that this ledge has "petered," or the gold exhausted, while the facts do not warrant any such conclusion. There is, perhaps, a "jump" in the ore shoot, but the mine has not been properly prospected. There is every reason to believe that when that is done the mine will yield up its gold in greater abundance than it did in former years.

And here, still, is another instance of this idle and do-nothing business, that is surprising to a man of energy. Near the town of Stella, or more generally known as Whiskytown, there is a large out-cropping of quartz, which in former years, paid to work in places, as the saying goes, that has remained unworked and undeveloped for many years. The showing is this; not long since a lower tunnel was run in this great quartz deposit and the ledge is found to be something like sixty feet in width, and at this point showing a different character of ore from that found near the surface. While it is somewhat refractory, yet a great deal of it is quite rich, and there is no doubt but what there is a sufficient body of rich ore to justify the erection of extensive reduction works on the same. But no, this ledge like the others mentioned, is a dead mine perhaps, for the simple reason tbat its owners are unable to go ahead and properly develop the same to a permanent basis. We allude in this case, to the "Old Phœoix Mine." And thus in like manner, we mlght mention many other similar instances In this camp, now so dead and lifeless, where all is required is a little capital and a reasonable amount of energy to make them rich and prosperous mines.

In conclusion we will remark that this Is a good field both for the prospector and the mining capitalists. Any letters of inquiry, touching this subject, if addressed to the initials hereunto subscribed, will he promptly and truthfully answered. Very respectfully,

Stella P. O., Shasta Co., Cal. J. P. W. D.

The New Gold Camp at Calmalli Lower California.

TO THE EDITOR:—The Calmalli mines, which are owned hy the Ibarra Gold Mining Co., recently incorporated in San Francisco, continue to improve greatly. The active prospect and development work has been going on night and day for tbe past year without intermission, and the mines look more encouraging as the exploration work is pushed forward. The success of the new camp is more than assured. It really looks very flattering to the oldest and most conservative mining men. Out of the five mines on which active operations are being pushed forward (four of them having quite extensive workings), not one shows any sign of weakening. Over 1000 feet of work has been accomplished.

The La Plaga and Otilia mines have the deepest workings, the former having a shaft 200 feet deep and the latter nearly 300 feet deep. The two shafts are located on the same vein and are about 1500 feet apart. All the ore from the two mines is precisely the same. The vein averages from one to three feet wide, and is of a ribbon-like character throughout all the shafts and drifts in the mines. At some points the vein is of a low-grade character, but the high-grade rock is in excess of the low-grade. All of the quartz, heing milled just as it came out (not a pound of it heing thrown away), showed a net average milling yield of nearly $17 per ton, gold hullion. The method of treating the ore was simply battery crushlng and amalgamation through a 10-stamp mill; therefore, it is a reliable sample of the rock hanging in the stopes. No rock has been extracted outside of the shafts and drifts; it is hanging in the reserves ready for stoping. About 100 men (Mexicans) are employed in and about the mines, and an additional force of men is to be put on while the 10-stamp mill is being enlarged with new machiuery and everything got in readiness for running.

Experienced California mining and millmen have the management of thls work in hand, and, at best, it will be some time before the details can he completed, as everything will be put in first-class running order.

The directors of the company owning the newly developed mines of Calmalli are elated over two hig strikes which have just heen made, one being in the San Juan and the other in the San Francisco mine. The first strike was made in the San Juan mine while sinking the new double-compartment vertical shaft, which is located north of the old workings. It was intended to tap the ore bodies which have already heen developed in tbe old workings. The shaft had only got through grass roots when a four-foot hlind ledge of quartz was cut which has an average free-gold milling value of from $15 to $20 per ton. Some of the specimens yielded are remarkahly rich. A few feet helow the large vein another vein a foot wide and of the same grade of ore was cut, it followlng the shaft for 30 feet when it finally dipped out. It had no sooner left the shaft when a third vein made its appearance. After cutting through the new one it proved to be a cross vein over one and one-half feet wide, cutting across the slate strata, the other veins and everything in its path. The average milling grade of the ore is over $25 per ton free gold; drifts will be run to prospect this extraordinary new cross vein as soon as the shaft is extended a little deeper.

From the bodies of high-grade quartz which lie in the old workings 50 to 100 feet deep, and to the south of the new shaft, the possibilities of the future outlook of the mines of this camp seem great, hut now, after these unexpected new ore shoots have heen struck in the shaft, they seem greater.

The other strike was made in the San Francisco at tbe 50-foot level. A 20-foot cross drift was run with the resnlt of cutting a two-foot vein of high grade ore. It is not yet known just how high this ore will average, hut it Is safe to put it at a very high figure. Yours very truly,

FRANK DAVIS.

Pocket Mining.

NUMBER III.

Free or Decomposed Pockets

The professional pocket-hunter, when he finds a trace from a free or decomposed pocket, goes to work tracing it up in the followiog manner: He first ascertains by panning where the gold lies; whether on top of the ground in the grass roots, or down deep in the soil, or on bedrock. When he finds out where the gold lies, or, in other words, where he gets the biggest prospect, he then pans across the trace to find the center. Gold, on account of its great specific gravity, will work down hill in the same course from the pocket as water would from the same source, and when he finds the center of the trace, which he determines by the prospect he gets in the pan, the largest prospect always being in the center of the trace, he then closely examines the gold in order to find out whether he has more than one kind or not. When he is satisfied that he is getting only one kind of gold he tries a panful from the center of the trace farther up the hill. If the trace is a slim one and he only gets a very light prospect in the center of the trace, say three or four small colors to the pan after panning carefully to save everything that has greater specific gravity than the dirt, particles of broken rock, etc., he closely examines the result in order to find out what goes with the gold. He does this so that he can follow that mineral, which comes from the pocket also, should the gold give out entirely in the trace before he reaches the pocket.

To find out what mineral comes from the pocket with the gold, he pans across the trace the same as he did to find the center. If he gets a coosiderable amount of any mineral substance or crystals in his pannings in the center of his trace and does not get on either side, it invariably comes from the pocket or from the ledge that gives the pocket, so by following what comes with the gold, when the gold gives out, it will lead to the ledge, at the point where the pocket exists. When there is one or more kinds of gold in the trace it shows that there are two or more traces run together, or lapped over each other, and coming from as many different pockets.

Sometimes the second gold found in the trace comes from a seam or ledge running parallel with the trace, which gives out a little gold all along, and on which the pocket exists. Oftentimes prospectors who are inexperienced and cannot always tell pocket gold, work on what they suppose is a pocket trace when in reality it is gold thrown off from one of those blind ledges or seams that run in an up-and-down-hill course and give out a little gold all along, and does not "pocket" at all.

When there is sufficient gold in the trace to follow, and the largest amount is on top or in the grass roots, the prospector follows the gold until it gives out and then drops back and finds the feeder or "spur hole," or where the gold goes into the ground as it were, which leads him to the pocket. If he fails to find the feeder without disturbing much of the ground in the vicinity of where he thinks the pocket is, he then cuts a trench down to bedrock, up and down hill, at the end and in the center of the trace, commencing a little below where the gold gave out and extending it up above where he got the last gold. By doing this he cuts across the ledge or seam which gives the pocket, and then it is an easy matter to find the feeder on the ledge. Should he fail to find a ledge or seam in his trench, which should extend up and down hill far enough above and below where his gold gave out, to cut the ledge if it runs crosswise of the hill, theo he digs aoother trench at right angles with the first one, a short distance below where the gold gave out, and in this trench he will cut the ledge if it runs parallel or nearly so with his trace.

In this manner he is sure to fiod the ledge, and when once found it is an easy matter to find the spot where the pocket is. I have seen places where prospectors had followed up traces until the gold gave out, and then dug hole after hole and tore up the earth in such a manner that it would be almost impossible for the next prospector who came along to find out where the gold gave out. When such prospectors fail to get the pocket, it is a soft snap generally for the professional who comes after him, for half the work is already done for him and he goes to trenching and soon finds the ledge which the first man has dug holes on both sides of, but did not happen to dig one on the ledge.

In many places the ledges crop or give out considerable float, and in such cases the pockets are mure easily found. At the point where the pocket occurs the ledge is generally more or less decomposed, and in most cases it carries a large amount of iron oxide. The stringer or ledge that invariably comes in through the country rock and contacts with the ledge at the point where the pocket occurs, is generally largely composed of lime, iron, copper, or manganese.

If it is composed largely of quartz, or is a quartz ledge or vein, it will be found to carry one or more of those minerals in large quantities.

In the northern counties of California above Shasta, and throughout southern Oregon, the contacting seam or stringer is generally lime. It is invariably white and oftener in a chloride form than any other. This combination of mineral which exists in pockets of this class only decomposes the ledge where the pocket occurs, and the ledges in nine cases out of ten are barren of gold eighteen inches and two feet on either side of the pocket. Sometimes a color of gold cannot be found six inches on either side of where the decomposition ends. Those pockets mostly occur in soft, yellow porphyry which contains a large percentage of lime and iron and is prolific in small stringers of quartz and llme. When the prospector is hunting for a trace, and he finds this soft porphyry formation, he forms his ideas as to how the ledges run. Then he commences panning around the base of the hill, point or ridge, taking his panfuls about 25 or 30 feet apart until he pans around the base of the hill. If he does not find a trace then, and still believes that there are pockets above, he goes a hundred yards or so farther up the hill or rising ground and pans around the same as before, so that if there should be a trace above that did not reach down as far as the foot of the hill or point, he will catch it in his second panning around the hill.

Many pocket-hunters follow this method. They find out where there has been a short gulch that paid well to placermine, and, when they find out at what point the pay quit, they pan on either side of the gulch on the sidehill until they find where the gold came into the gulch and then follow it up to the pocket or to where the pocket has been. In most cases, where the short gulches have been rich, the pockets which fed them are all out and gone; but if the pocket-hunter once finds the ledge where one of the principal pockets came from, he then has the main key to the situation. He follows along the same ledge, for it is likely to pocket in another place. Then, again, it often occurs that where the pocket is broken away and gone down into the gulch, there is one or more still existing underneath where the first one was. If he does not find a trace on either side of the gulch, and there is a little gold still in the gulch, he follows the gold until he finds where it leaves the gulch and follows it up the hill until it leads him to where it originally came from. I know where traces, and what would be called slim ones at that, have been followed for over half a mile to a pocket amounting to no more than $50; and in one particular case in southern Oregon, I followed a trace over three-fourths of a mile and found the pocket.

ALEX QUARTZ.

A Banker's Opinion of Hydraulic Mining.

Mr. John McKee has written a letter in which he urges assistance to the hydraulic mining industry. Mr. McKee is manager of the Tallant Banking Company of this city and president of the San Francisco Clearing-house Association. The San Francisco Clearing-house Association is composed of the following members: The Bank of California, Bank of British Columbia, the Bank of British North America, Donohoe-Kelly Banking Company, the First Natlonal Bank of San Francisco, London and San Francisco Bank (limited), the Sather Banking Company, the Anglo-Californian Bank (limited), Wells, Fargo & Co., the Nevada Bank of San Francisco; London, Paris and American Bank (limited), Tallant Banking Company, the Crocker-Woolworth National Bank, Grangers' Bank of California, American Bank and Trust Company, Bank of Sisson. Mr. McKee's letter is as follows:

Editor Daily Report.—SIR: In reply to your inquiry you may say that in common with others interested in the development of the material resources of California, I should he very glad indeed to see the new laws affecting the hydraulic mining industry put into speedy practical operation, so that these mines may resume work at once. That the stoppage of these mines seriously affected the gold output of this State there can be no question; and that we need all the gold we can get there can also he no question. The gold in those gravel hills is an available source of supply which we ought to draw upon as soon as possible.

California stands pre-eminent as the great gold-producing State of the Union, having led all others in this branch of mining ever since the first discovery here. Out of the aggregate of $33,000,000 in gold yielded hy the mines of the United States last year, California alone produced $12,571,000 of that metal, or over one-third of the total. The next highest gold producer of the States is Colorado, which during the same year turned out about six and a half millions. This shows how far above the others our own State stands in gold product.

That California is still able to maintain its position so far in the first rank in this respect, notwithstanding the closing down of its producing hydraulic mines in the Sacramento and San Joaquin river drainage basins, should be a cause of congratulation, especially now when so many silver and lead mines are closing down all over the country. But this should make our citizens use every effort not only to maintain this annual gold product, but to increase it. That it can be increased by the working of the auriferous gravel deposits is plain, and the recent legislation shows that there is evident desire on the part of the State and Government to see these mines again in operation.

The State has, through its Governor and the Legislature, asked Congress to assist in the rehabilitation of the hydraulic gold mining industry of California, and Congress has complied with the request to the extent of passing a special law and providing a special commission of engineers to carry it out. The miners themselves must pay for the impounding works required under the new law, no appropriations having been made for any such works. The miners are merely given permission to work under certain restrictions. Many of them, I am told, will not be able to build these works, from lack of means, their mines having been long closed down, and therefore profitless. Moreover, the members of the Engineering Commission, having many other important duties to perform in connection with river and harbor work, are unable to give more than partial attention to the mining question.

This is to he regretted and it is to be hoped that measures of relief will be asked for and applied. To rehabilitate an industry so long dormant will require active steps on the part of all its advocates and the citizens of the State should lend such assistance as they can. The possible addition of eight or ten millions of new gold which these mines could turn into the channels of commerce and trade every year, if they were all at work, would make a very decided difference in our financial and industrial situation in this State.

San Francisco, July 11, 1893. JOHN MCKEE.

A MAN'S LABOR IS CAPITAL.—All prospects that look like they may make a mine do not develop into one. It takes capital to develop a prospect into a mine. A man's labor is capital. Why all this noosense about Eastern capitalists being bitten in mines? If they put money into a developed mine they can measure its value the same as corn in a crih. If they will not take the pains to find out what they purchase, they are not business men. If they purchase a prospect, they have no guarantee that they will get their money back; yet on the other haod they may reap a rich harvest hy the expenditure of a little money. The man who has the real risk is the one who seeks amid the recesses of the mountains for the metals. He risks his life, and, if he finds nothing, his time has gone for naught. He may locate good-looking prospects and spend years opening them up, with his limited means, only to find that there is no pay in it. Eastern people do not put money in mines only for expected gain, and, if they lose occasionally, it is no more than the prospector and real miner does. Is it not a fact that they win oftener than they lose; that millions taken from the Western hills finds its way into the pockets of Eastern men?—Mohave County Miner.

On Behalf of Silver.

The Appeal of Colorado for Its Chief Industry.

The Committee on Resolutions of the Denver Silver Convention presented a report which was unanimously adopted. We print an abstract of the report, which is in the form of an address to the people:

"*To the People of the United States:*—The people of Coloradu, standing in the gloom of impending disaster, and representing in condition and sentiment the people of Montana, Idaho, Wyoming, Nevada, South Dakota, Utah, Arizona and New Mexico, with reverence for the Constitution and unswerving loyalty to the general Government, ask for your calm and candid consideration of the following facts before you give approval to the destruction of silver as money, and to the final establishment in this country of single gold standard values, and thus at one stroke change all debts to gold debts and inaugurate a never-ending rise of gold and a continued corresponding fall in the price of every commodity:

"Congress is called to meet in extra session August 7th. Preceding the call, the classes which struggled for 20 years to overthrow a himetallic money standard, provided by the Constitution, have inaugurated a paoic which they have untruthfully charged to the existing silver law, ignoring the facts that there are $300,000,000 in outstanding legal tender notes, commonly called greenbacks, that are equally available with treasury notes issued in payment for silver, to draw gold from the treasury; that the balance of our foreign trade has turned against us, rendering settlement abroad with American gold a necessity, and the great bankers of Europe are purchasing gold with which to change the money standard of Austria and fill the treasury vaults of other monarchial countries. It is their evident purpose to create a prejudice against what is known as the Silver Purchasing Act, and, under pressnre, secure its unconditional repeal. * * * * *

"Suddenly, like a fire bell in the night, the news was flashed beneath the oceans that free coinage in India had been suspended, and the market price of silver fell within 48 hours fully 20 ceots an ounce. This startling action, forced upon the Indian Government without a moment's warning, was a step held in secret contemplation by the British Government for months, to be taken at a critical and opportune time, when the consternation it must create would stamp out the last phalanx of himetallism's defenders, and must have had as one of its chief aims the intimidation of the Senate to bring it in line with the subservient lower house.

"Immediately the wires were burdened with appeals to the President from banks and clearing-houses and commercial bodies dominated by them for an extra session, and to Senators to repeal the Sherman law, which, it was claimed, was responsible for the disaster. A call was made. * * * * * * *

"Unconditional repeal means striking from the laws the last remnant of legislation that secures coinage for silver. It fixes the United States firmly in the ranks of single-standard nations. It is the consummation of a conspiracy, organized at the close of the Franco-Prussian war, to destroy as money of ultimate redemption half the coined money of the world, leaving the other half to bear alone the vast mountain of credit upon which the world's business is conducted, inviting more frequent panics and rendering them more destructive and enduring. * * *

"The Sherman law is not the work of the silver-producing States. It was forced upon the country against their will. Their constant demand has been that of the agricultural States west and south and the working masses of the whole country. They had not sought to impose upon the country some new financial nostrum, but asked simply for restriction of the coinage laws as they were from the first year of the Federal Constitution until the furtive repeal of 1873. The Sherman law is the trick by which restoration was defeated. It was accepted by oimetallists as a pledge that the old laws should at some future time be restored, and they now demand, not that the Sherman law shall be retained, but that the hostage shall be redeemed hy the re-enactment in its stead of the coinage laws under which the country grew and prospered for more than three-quarters of a century. * * * * *

"They urge the old law with supreme confidence, born of the unassailable truths of history, that it will immediately place every coined American dollar upon par value, both as coin and bullion; restore the bonds of weakened love and confidence, and set in happy motion the wheels of all the country's magnificent industries. Will you listen to us while we speak in words of sober earnestness of the local effects of the unconditional repeal silver will have? The silver-mining States and Territories, embracing 1,000,000 square miles of this continent, with 2,000,000 Americans inhabiting them, depend pecuniarily upon silver mining for prosperity. This industry is the very heart from which nearly every other industry receives support. Agriculture will not thrive without artificial irrigation. The mines of coal, iron, stone and clay, while magnificently worked, with such dear labor and so remote from local markets would be feeble in movement and their operation would he disastrous without the stimulus the mining industry affords. It supports our foundries, operates our machine shops, supplies our railroads with freights, stimulates travel, keeps bright fires in the smelters and sends customers to the shops of our merchants. It has invoked in the valleys and upon the mountain-sides the magnificent cities and thrifty towns and villages. Great manufactories of paper, cotton, leather, iron, steel and clay distribute finished products and support thousands of prosperous and happy families, but because agriculture is so limited in area (confined to narrow strips along our few and scanty streams), our labor so high and handiwork so remote from other than local markets, coal is mined, coke burned, grain grown and fruit gathered, In main for the owners and workers of silver mines and smelters and the proprietors and workmen of the industries and callings dependent upon them. The reduction in the price of silver to about 70 cents shut down

99 per cent of the silver mines in the country and the smelters must soon follow their example.

"There are in Colorado to-day 15,000 idle miners who know not where to turn if work is not resumed. There will soon be added to this idle army of labor 4000 men from the smelters. The stone quarries are nearly all shut down. Railway companies are laying off train crews by the score. The foundries are nearly all out of orders; farmers and fruit-growers will be barely paid for the cost of raising crops; merchants will be countermanding orders and traveling men for Eastern houses will seek almost in vain for customers. This is no exaggeration. The destruction of the silver industry will devastate the country as if swept by a cyclone, reaching from the British possessions to the Mexican border line. This is a sorrowful picture of Colorado, with her mining industry destroyed, but represents the condition of other mining States and Territories with the same calamity upon them. If the silver mines remain closed half the American output of lead must be lost. The greatest bulk of the lead product is taken from silver-bearing ores. It requires one metal, supplemented by others, to remunerate the lead-silver miner. Not less than 55 per cent of the gold product of the country depends upon the maintenance of the silver industry. Placer or creek washing, the earliest and most prolific source of our gold supply, is practically exhausted.

"Those who contend for a gold single standard willfully mislead you as to the cost of producing silver. We say to you, in the most solemn and truthful manner, that reliable statistics prove, including but legitimate items in the account, that the silver of Colorado costs, by the time it is on the market, not less than $1.29 per ounce. Like gold, some silver is produced for much less than the market value, but the average cost of silver is fully the highest price it ever brought in the market. All the mining States and Territories are in the debtor class. Stop and consider, men of the East, how many millions of your money is invested with us. Funds of the estates of widows and orphans are loaned on our lands, and have built our edifices. Colorado has been a favorite field for such investments. Have the people of any State ever proved more punctilious in prompt repayment? The Legislature has enacted laws that are cruel to our people and unrivaled in liberality to creditors, that no man might shirk or escape the repayment of a borrowed dollar. There are held throughout the East hundreds of millions of dollars in railroad stocks and bonds, in municipal securities, in trusts and mortgages, the payment of the greatest body of which depends upon the prosperity of the silver-mining country. We of Colorado pride ourselves upon our commercial and financial integrity. No calamity can induce us to repudiate a dollar of honest debt. All our assets are at the will of our creditors for reimbursement, but if by bad Congressional legislation, if through Congress you shall wipe out the great industry of the section around which all others cluster for vigor and profit, the values of our properties will shrink, our business will be destroyed, our towns and cities will be largely depopulated, and the railroads traversing the western half of the continent will be sent into bankruptcy. * * * * * * *

"Colorado, great in resources, proud of her business record, filled with brave men and resolute hearts, makes this its appeal for preservation to the open-hearted and generous people of the country. We are confident that it will not be in vain. The atrocity of making homeless, through the destruction of the chief industry of 1,000,000 square miles of American territory, 500,000 men, women and children, with all the attendant scourges of enforced and hopeless idleness, can never be the work of an American Congress with your approval. In hope of a speedy delivery from the crushing burden of a financial system begotten of the greed of Great Britain's remorseless money power, and of the prosperity inseparable from the American system which includes free coinage of gold and silver at an American ratio of 16 to 1, we submit to the people of the United States this statement of our cause."

The Cyanide Process in South Africa.

A recent publication furnishes some material which will be of great value at the present time, when all Australia seems to be in doubt as to the wisdom of employing cyanide for the recovery of gold. It seems that during December, 1892, the tons of stone crushed at the Witwatersrand field was 114,000, and the large bulk of tailings which require treatment has led to several important developments. The first of these provides for the delivery without handling of the tailings into leaching tanks, and the erection of extremely large and substantial vats. At the Langlaagte Estate no less than 12,000 tons of tailings are dealt with per month, and the vats employed are constructed of cement, this material only absorbing an infinitesimal quantity of the cyanide solution. The extracting reaches 85 per cent., and the cost per ton averages 4s 6d. Additional plant is being provided to raise the total capacity of the leaching plant to 24,000 tons monthly. It will interest Australian readers to be told the plan on which these cement tanks are laid out and worked. According to Mr. G. W. Shaw the vats and sumps are built into excavations in solid ground, the upper part being level with the ground. A tramline runs over the center of five large vats, each holding 450 tons, and is used for filling them, while a steam crane, running on rails placed on each side of these vats, lifts and empties the tailings when treated into a movable hopper placed over two parallel lines of trucks and fills two trucks at each lift, at a cost of less than 2d per ton, including cost of crane, wear and tear and maintenance. The time taken to empty each vat is 14 hours. The cyanide solution containing the gold is led by gravitation into collecting boxes placed in a shed some 200 feet away, and thence falls into two cement and brick sumps. It is brought up to proper strength by the introduction of stronger solution and then pumped back into vats. The whole system is claimed to be economical and simple. The total cost of the plant, including rolling stock, etc., was roughly £25,000. The fact which impresses one is the great enterprise and ingenuity exercised at the Rand to secure the cheap treatment of the tailings. In this respect the chemists there offer a great contrast to most Australian professional men. Here the whole process is being received with mistrust, although in South Africa its success has been demonstrated a thousand times over. At the Salisbury cyanide plant for instance—a small concern—a tailing's wheel lifts the discharge from the plates to a flume, which carries it to a hydraulic separator, which separates the slimes from the coarse tailings. This, it is stated, renders the subsequent treatment very economical, as easy filtration is obtained when treating the tailings deprived of their slimes, and the valuable tankage space is not taken up by slimes. This mode of handling tailings could well be applied to some of our mines, and it is also proposed further to run the tailings deprived of their slimes direct into the cyanide vats with a view to saving handling. What is, however, of the greatest importance is that Mr. Bettel, of the Robinson mine, has completed a method for the rapid and economical treatment of slimes in a filter press, thus solving a most difficult problem.—Australian Mining Standard.

British Columbia Mines.

The Ores and Mines of Slocan District.

We take the following from the Nelson *Tribune:* The closing of transportation routes for the last three months has been a good thing for the mines in Slocan district. This will appear an absurd statement to the many who believe that a mine-owner who has ore in sight needs only to sack and ship it. But the few who are practical understand that, no matter how large the ore-body, a certain amount of dead work must first be done in a mine before ore can be shipped profitably. The time that has elapsed since the breaking-up of the sleigh roads and trails into Slocan district has not been lost by the owners of several of the best mines in that section. Instead of "gutting" their properties, in order to live up to their contracts with the teamsters, they have been running tunnels and drifts, making raises and sinking winzes; in fact, doing work that will enable them to ship ore continuously hereafter without robbing their mines. In doing this another thing has been proved—something that should give every mine-owner in West Kootenay renewed confidence—that is, that not a single property on which work has been done has the ore-body petered out. To-day there is not a mine in Slocan district, on which work is being done, which has not improved as depth was gained. It is not necessary to cite instances, but the following are given at random: The Washington, the World's Fair, the Bonanza King, the Bluebird, the Slocan Boy, the Freddy Lee, the Slocan Star, the Mountain Chief, the Alpha, and the Lucky Jim.

At the Washington the ore-body is larger than ever before; at the World's Fair and Bonanza King the main tunnel is in 225 feet, with the face in an ore-body fully ten feet in width; the Bluebird never looked better; the Slocan Boy looks almost as well as the Washington, of which it is an extension; the Freddy Lee can now ship ore without robbing the mine; the Slocan Star never shipped a pound of ore, and has hundreds of tons ready for stoping; the Mountain Chief has three tunnels, all in ore, some of it so rich that assayers are afraid their returns will not be believed; the Alpha has over seven feet of ore, and its owners do not know what price to put on the property; the Lucky Jim is a bonanza since last Friday, the day on which a 10-foot ore-body was uncovered by running an open cut. Development work is also being done on half a hundred other claims, such as the Wonderful group, the Read & Robinson group, the Young Bonanza, the Rico, the Idaho, the Canadian group, the Ruby Silver, the Snowstorm, the Whitewater, the Wellington, the Northern Belle, and the Duluth syndicate claims on Sandon creek, and assessment work on many more. It is safe to say that fully 300 men are working for wages within a radius of 12 miles of New Denver, and that an equal number are prospecting or doing their own assessment work.

It is not the fact that the ore-bodies are large and in place that gives the people of that section so much confidence, but their confidence is due to the fact that they know they have ore that can be shipped at a profit, even with the duty and heavy transportation charges against them. Probably in no other mining district in the world producing wet ores is the ore of so uniformly a high grade. As instances: The owners of the World's Fair and Bonanza King have 100 tons of ore sacked on the dump. From each sack a piece of ore was taken, and a sample of the 100 tons thus obtained gave a return of over $200 in value to the ton. The Mountain Chief ore is exceptionally high grade, assays running from 1635 to 2552 ounces in silver and from 63 to 81½ per cent in lead to the ton. The Washington has shipped 560 tons to the Selby Lead Works of San Francisco, from which the returns were over $75,000—more than enough to pay every dollar the owners have expended on the mine.

As the development work in Slocan district is all done through tunnels, depth is not gained as rapidly as when shafts are sunk. On the Washington the greatest depth is probably 300 feet; on the World's Fair and Bonanza King, 160 feet; on the Mountain Chief, 125 feet; on the others from 150 to 250 feet. On the Mountain Chief the upper tunnel is in 65 feet, the middle one 100, and the lower one 70. The face of the middle tunnel is now under the mouth of the upper one, and every foot it is extended will give 75 feet of stoping ground. The ledge is from five to seven feet wide, and the pay streak 18 inches of clean ore. Shipments will be resumed at once, the ore going out by way of Kaslo to the United Smelting and Refining Company at East Helena and Great Falls, Montana. The Mountain Chief is the most favorably situated mine, barring the Lucky Jim, in the district, as it is but a few hundred feet above Carpenter creek and less than two miles in an air line from New Denver. On the World's Fair and Bonanza King the main tunnel is in 225 feet. Two raises were started from the main tunnel, one reaching the surface in 69 feet; the other is up 40 feet, and 100 feet will yet have to be made before the surface is reached. Sixty-five feet from the mouth of the main tunnel a crosscut one was started. It is now in 65 feet and when through to the surface it will be used for a working tunnel. In running the 65 feet, two small veins were cut—one 14 inches the other 18 inches wide—and another and larger vein that crops out on the surface is almost sure to be cut in the next few feet. No stoping has been done. All the ore sacked and on the dump—100 tons of galena and 250 tons of carbonates—came from the tunnels and raises. As stated above, the galena runs over $200 to the ton; and from samples assayed, the carbonates will yield fully $100 to the ton. On Friday a great ore body was uncovered on the Lucky Jim by running an open cut a few rods from the mouth of the tunnel. This claim is so situated that the cost of getting its output to any wagon road or railroad that is built past Bear lake must be but nominal, for it is less than a quarter of a mile from the trail leading from the end of the Kaslo wagon road through Three Forks to New Denver. On the Washington the lower tunnel has not yet reached the ore body, but the main one continues in six feet of good, clean ore. At the Slocan Star the indications all are for a wonderfully big mine; and the fact that the Duluth syndicate has struck ore in an extension on the south side of Sandon creek goes to confirm the expressed opinion of many mining men, that is, that the Slocan Star ledge is one of the large and strong ones in the district. On the Alpha, one of the Grady group, the ore body exposed is simply immense in extent, and the ore the highest grade of any in West Kootenay district.

It must not be inferred from the above statements that the owners of these different properties have big bank accounts; for they have not. Every ton of ore shipped out of the Slocan country has paid fully $100 in the way of mining, transportation, duty, and smelting charges; and, from the present outlook, the cost is not likely to be reduced this summer. No one of the mines is accessible except by trails, varying in length from one to twelve miles, and ore cannot be packed over trails as cheaply as the unthinking imagine. Had the provincial government been a far-seeing one, every dollar appropriated for new government buildings would have been appropriated for wagon roads in our different mining camps, and the result would have been that instead of publishing the proceedings of indignation meetings held throughout the province, our newspapers would be chronicling within the year the output of mines in a hundred different camps in Kootenay, in Yale, in Lillooet, and in Cariboo.

Estimating Cost of Special Machines.

A machine tool manufacturer, whose product is known in every civilized country, said recently that he had about decided that it did not pay to undertake to build a machine embodying new ideas. Concerns having the requisite facilities, says the *Iron Age*, are frequently requested to estimate on some large machine of special design intended for a particular service. The machine is unlike anything in the market and the applicant desires to know in advance what it will cost. Long experience had proved to the satisfaction of the builder referred to that it was impossible to estimate the cost of that particular machine and be just to himself and his customer. There were always difficulties which could not be foreseen and provided for, and which appeared during the entire progress of the work.

Trouble begins in the drafting room. It is very seldom that the drawings presented are so complete and accurate as to admit of their being sent directly to the shop. In the vast majority of cases the prospective builder is expected to provide such drawings as he may need, and in some instances he is required to furnish a complete set. To tell in advance how much labor this may require is out of the question; it is only possible to form a rough estimate and charge accordingly. That this is by no means an insignificant factor of the problem may be judged by the fact that in some cases the bill for drafting amounts to more than ten per cent of the total cost of the machine. Sometimes the builder is only furnished a rough sketch of the principal features of the machine. He is expected to supply all the missing material, and, if necessary, to design such parts as proved to be beyond the ability of the purchaser. For this work he receives no pay.

When the drawings are presented in a fairly complete shape, so as to convey a clear idea of the design, there is comparatively little difficulty in forming an estimate of the cost of the patterns needed. In addition, there is very little danger of loss by reason of inaccuracy in this department. The same cannot be considered as holding good in the foundry, especially if some of the patterns are intricate and difficult to mold. The loss here may be considerable, and even the exercise of the utmost care will not insure perfect castings every time. In this, as in other work, the risk is greater if the pattern is radically different from the ordinary run of work done by the molders. For his own protection the builder is compelled to recognize this and provide for it in his estimate, but he is at a loss to know exactly what to charge for what we may term contingencies.

In the machine shop there is less difficulty, and if the other departments could be calculated with the same degree of confidence the problem would be simpler of solution. But it may be that the machine under consideration will require the use of a tool not in the shop. Should this tool not be needed regularly, the work must be done elsewhere.

Another phase of the question is this: Three manufacturers are requested to present bids for building an expensive machine of new design. They spend considerable time and perhaps some money in making their estimates. We will suppose this expenditure to be the same in each case. One man gets the contract—the others suffer loss. Should the two who fail to get the work be recompensed for their trouble? We are well aware that this point has been freely discussed, but we do not know that any attempt has been made to obtain pay for this work, which is practically thrown away.

Price, $8.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from ormulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Mechanical Progress.

Triple-Expansion Engine Economy.

The triple-expansion engine of to-day, says *Industries and Iron*, is undoubtedly a step in advance from the view of keeping up the steam pressures, but it is very far from being accurately demonstrated to what extent this is an economical advaoce. The demaod for higher pressures of steam, and hence the larger range of expansion, has had the effect of causing manufacturers to seek for an engine which, to their mind, was best suited to the purpose of utilizing the pressures thus obtained; but there is a great difference of opinion even among eogioeers as to the triple-expansion engine being the best for all purposes. It has seemed almost impossible for the compound engine to be worked with high pressures oo account of the great range in temperature in its cylinders during expansion, but if makers are put to it some means might be devised, with little trouble, to get over what does not seem to be an insurmountable difficulty. The steadily increasing use of the spleodid adjunct to steam cylinder efficiency would then come into more general favor, for there can scarcely be a second opinion that the steam jacket, when properly used, effects a large saving, although in the haods of the careless it is only a large consumer of coal, and hence detracts from the engine efficiency.

What are the media usually placed round the walls of the cylinder to prevent this great loss of heat? With the use of such a substance as asbestos or its kindred competitors it would he impossible to so clothe a cylinder as to prevent a loss of heat to the extent of ten degrees only, for although asbestos will, to a certain degree, retain the heat due to the walls of the cylinders, it caonot increase the temperature at a point two or three feet away, and, therefore it must prove a failure. Air, heated to a temperature as high as the funnel gases, will in like manner fail, owing to the difficulty experienced in causing it to properly circulate, and also on accouot of the quick manner in which air gives up its heat, it must prove itself detrimeotal to retaining the heat from the surfaces over which it passes. There is, really, therefore, only one medinm left, and that is steam. Steam can be applied in two ways—firstly, either by sending it through the jacket in a quick circular motion—a spiral would be the best—or, secondly, hy allowiog the jacket to remain full of steam and only draining off the water as it accumulates, and here arises what may be considered the crucial point.

To drain off only the water is at once a difficult and tedious task, aod numerous so-called steam traps are very difficult to manage and keep in working order. They are apt to "stick up" and so prevent the proper working of the valve. The use of a drum with a gauge glass in the front and connected at the top with the jacket and at the bottom with the condenser, although more reliable, is scarcely worth the thought, as it requires as much attention as the main boilers do to keep the water steady, and at the present day, when the numher of hands carried on a vessel are so few, it cannot he wondered that engineers on watch condemn anything which is likely to add to the number of parts under their control. Two questions, therefore, present themselves: Cannot a good automatic steam trap be designed to meet the case, and can nothing be done to help forward the re-introduction of the steam jacket?

With regard to the first question, no doubt it will be urged that there are many efficient steam traps in the market, and there is little doubt as to the truth of this statement, but it is invariably found that even the best are likely to get out of order when used at sea, consequent, no doubt, on the dirt and suspended matter which is usually found in the feed-water and the condensed steam from the jacket. The movement of the valve is also usually so small as to cause "scoring," and thus leakage is produced. To engineers ashore this is of little moment, as when it is found that the trap is not working properly, it would be put out of work to he overhauled when steam was down for the night. With the marine engineer, however, it would mean that the trap would have to be taken apart, possibly under circumstances which would reoder the matter far from easy, and it may be, in cases where there are very few engineers, after the completion of a long watch. Under these circumstances we need not be surprised that steam traps are universally condemned in marine practice, and owing to the want of a thoroughly reliable one the marine engine is handicapped over and above what it should he.

As regards the second question, there is little doubt that the despised steam jacket must again come to the fore, especially as pressures tend to increase. Those who have had to do with the working of triple-expansioo engioes at sea know full well that the economy of the engine depends mainly on the ability to get a good proportion of the full power out of the engioe, for when the power in the triple-expansion engine is reduced there is present with the steam large quantities of water, sufficient to cause it to he felt in the cylinders, aod hence erroneously attributed to priming.

Heating Boilers with Refuse.

An interesting scheme (which, if carried into effect, will be the first attempt on a practical scale to utilize house and town refuse in the heating of boilers for the production of electricity for illuminating purposes) is suggested by the engineers to the St. Pancras Vestry, which was the first local authority in London to establish a central electric light station on its own account. At the present moment the Vestry's station is capable of supplying 10,000 incaodescent lamps simultaneously, correspondiog to 13,300 lamps iostalled, and of which 11,000 have been installed during the 18 months that the station has been in operatioo. The prospects of the demaod for light largely increasing are favorable, and the engineers suggest that a second generating station should be erected, and worked with great ecooomy by the use of refuse destructors. It is proposed that this station should be combined with, and be built on the same site, as works for collecting house aod street refuse, the buroing of such refuse and the utilization of the heat obtained from such burning for the generation of electricity and for other purposes. The principle of the destruction of refuse by destructor cells is now well recognized, and is being adopted by various local authorities in the United Kingdom. The scheme provides for the laviog down of generating plant to supply 4800 lamps iostalled, ample space heing allowed for future extensions. At the commencemeot, three engines of 200 horse power aod three boilers would be installed; the boilers would be heated by the gases from the destructors passing round the outer shell and escaping by the main flue, crossing under the front eod of the boilers to the chimney. The power available from the destructors will not be less than 300 horse power, with the first installment of three boilers, and 500 horse power with a complete set of five boilers. Arrangements are also provided for firing the boilers with coal in the usual manner by hand, or by the use of mechanical stokers, so that steam may be more rapidly raised to meet any sudden demand due to fogs and at times of maximum load. It is belleved, if the scheme is carried into execution, as seems probable, that it would not ooly yield a remunerative return in the supply of light, but that the expenses incidental to the present method of disposing of the refuse would be considerably reduced.—Electricity.

POWER FOR SMALL ENTERPRISES.—The supply of power to small enterprises for special occasioos has long been a missing factor in our humbler industries. Those that are not financially equal to the expenses of an ordinary power plant are by no means so limited as some suppose, while the disadvantages are too keenly felt to require comment. It would seem that the escape lies in the direction of electricity, especially in our cities and larger towns, where electric lighting is permanently established. In this sense the electric motor is destined to be the poor mechanic's friend. Its management and control is simple, its service is in direct and immediate command, it requires no licensed engineer or fuel, and in economy of space occupied has no competitor. In some instances where needed for intermittent use, power can be furnished at one-tenth to one-fifth of the cost of steam. It has found its way into plumbing, metal-spinning and machine shops in New York, and as an economic factor, with the other advantages named, there can he no grave question as to its more general adoption. We predict the rentiog of electric power to yet become a remunerative and general enterprise.—Age of Steel.

THE relative efficiency of the hammer and the hydraulic press is a question which has been hotly discussed by experts. Ahout a year ago some very interesting experiments were made at the Arbel forges at Rive-de-Gier in France, which failed in their immediate object, which was to establish a defioite ratio hetween the weight of a hammer and the power of a press required to do the same work, but which nevertheless shed some light on this subject. The general conclusion reached was that forgings made under the hammer showed a finer grain aod a greater degree of uniformity in texture than those made with the press. It was noted that while hammer forgings showed a better surface, the press forgings had a greater density in the center. These experiments, while their general indications favored the steam hammer, were hardly carried far enough to he conclusive.

Scientific Progress.

Do Doctors Spread Contagion?

The surgeon and the obstetrician utilize the means that experiment and observation have proved necessary to render their work aseptic. In case of the entrance of disease germs, they take prompt means to destroy them, or to neutralize their effects. It behooves us, who practice among children suffering from contagious diseases, to inquire if we are equally careful.

The snrgeon about to open an abdominal cavity removes all possible sources of infection from his patients person and environment, and goes to his work with clean linen and clean hands. Do we do likewise?

Some time ago a promioent operator sent me an invitation to witoess an abdominal section, adding in his note, "provided you have not visited a case of scarlet fever or other contagious disease during the last 24 hours." I could not but thiok, if such precaution is necessary to insure the safety of this patient, what are the risks to the little children that I shall visit after seeing the case of scarlet fever or other contagious disease, and whose systems are fertile soils for the poison to develop it?

The danger of such conveyance is great, as physicians with large family practice know, and many, like myself, have been taught the lesson by sad experience. I can recall several instances in which the children of physicians have fallen victims to scarlet fever and diphtheria, the cause being clearly traced to disease brought home by their fathers.

Let me illustrate this danger by a description of a physician's visit to a case of diphtheria. The doctor enters the house, removes his hat, overcoat and gloves, and is shown into the room containing the patient, and comes ioto direct contact with the atmosphere loaded with the germs of the disease. His hair, woolen clothing, hands, etc., must more or less ahsorb the poisoo, in his stay of about 15 minutes. What does he then do? He replaces his overcoat, carefully buttoning it up, as if to keep as many of the germs as possible warm and well protected. He puts on his hat as he crosses the threshold, jumps into his carriage, covers himself with robes, and drives to his next patient; enters, takes off his hat and coat, and woe to any little ones who live in that house! The doctor has probably that with him which will more likely kill than cure.

What should be done to diminish this danger? Stay no looger in a house containing a contagious disease than is absolutely necessary. Don't remove your hat or unbuttoo your coat in that house. After examining the patient, go down stairs, preferably at an open door or wiodow, and give directions for treatment. The family of the patient will respect you for the care you exercise when you explain the reason. Drive without covering with robes to your next patient, and be sure that patient is not a child. Never allow a messenger from a case of contagious disease to call or wait for you in your office. Instruct him to bring written messages and leave them at your door. If the messenger wishes to speak to you, tell him to wait outside your office and ask the servant to call you to the door.

I have more than once been startled on entering my office to see a man or woman whom I knew had been constantly for days and nights nursing a had case of diphtheria sitting complacently alongside of two or three children, all waiting to see me. On several occasions, mothers have brought children sufferiog from severe attacks of diphtheria to my office and waited to see me.

When you come home from a case of contagious disease, besides washing your hands, face and head with soap and water, hang up your hat and coat in the air, and put on a fresh coat.

I did this some time ago and forgot to bring them in when I went to bed. It rained hard all night; but better lose a hat and coat than a patient.

If you return late at night from a case of contagious disease, besides washing, undress before going into the room where your children are. Keep your own children out of your office, and do not take them in the carriage with you when visiting patients. How do you know but some of your calls may be upon those with contagious diseases?

Our Board of Health instructs us, in cases of contagious diseases, to forbid the children of the household to attend school or other places of publc resort. This is a wise precautioo, and the doctor, when he has been in contact with contagious disease, should, so far as possible, follow the advice given to the children.

We are told that familiarity with crime leads us to endure it. Likewise familiarity with contagious disease is likely to make us at times careless in using the means necessary to prevent its spread. Physicians are but mortals, and, while as a body they are conscientious in the discharge of their duties, candor compels me to confess that they are not at all times as careful as they should be.—Dr. John Graham, in Philadelphia Medical News.

Naphthalene and Benzol in Coal Gas.

In a paper by Professor Buote, read before the 31st meeting of the German Gas Association, on the above subject, he began with the statement that naphthalene is not formed in the gas while in the pipes, but in the retorts, and only at a high temperature. In the process of gas-making, the gas which first comes off is rich in marsh gas and poor in hydrogen, while toward the end hydrogen predominates. If henzol is overheated, there is a slight separation of carbon and hydrogen, and naphthalene is formed. This is a very stable substance, and it is produced whenever organic substances are decomposed by a very high temperature; and this accounts for its unavoidable presence in coal gas. If the temperature be still further raised, we have still more coalescence, and anthracene and chrysene are formed; while beyond these we have absolute charring as in the formation of graphite on the walls of the retort.

One ton of coal gives 3.408 cwts. of gas, or 10,595 cubic feet at a specific gravity of 0.44; aod this gas contains 2.800 pouods of crude benzol, of which 2.100 pounds are pure benzol and the rest toluol and its homologues, as well as some traces of naphthalene. The tar is about 1 cwt., and the liquor about 2.2 cwts., and these together cootain about 0.112 pound of benzol and 0.09 pound of toluol, along with 0.672 pound of naphthalene, 0.157 pound of pheool, and 0.045 pouud of anthracene. The benzol is, therefore, present to the extent of 96 per cent in the gas and 4 io the tar; toluene, 89 in the gas aod 11 in the tar; and naphthalene, traces in the gas and almost all in the tar.

It might have beeo thought that the gas was completely saturated with benzol after the condensation aod purification, and that its surplus had been deposited in the tar. But this is not so. The reason why there is any benzol at all in the tar is that the heavy oils have dissolved some out of the gas. So far from the gas heing saturated with benzol, it would carry 87 grains per cubic foot at 15° C., while there are only from 18 to 22 grains in it. The gas can be cooled even by ice without depositing any benzol.

With naphthalene, on the other hand, the position is eotirely differeot. There is very little naphthalene in gas, but the amount produced in the retort is far greater than that required to saturate the gas, which will only take up about 0.3 grain per foot, at 15° C.; and there is 10 times this quantity of naphthalene produced. The gas is, therefore, saturated with naphthalene, while with benzol it is not so; and if it be condensed to 15° and then sent on, and afterward cooled down beyond that temperature, it must deposit naphthalene.

Naphthalene presents this specially inconvenient peculiarity, that at all temperatures below its fusiog point (80° C.) its vapor condenses immediately into the solid form, and deposits in light plates, which stick to the bounding walls, and can only be removed by special means. The naphthalene will not, therefore, go away of its own accord; that is, it will not flow away as the other products do when they condense; but the crystals may go on accumulatiog if the exposure to cold continues. Prof. Bunte's conclusion is that with gas thoroughly purified and then sufficiently cooled at the works, there is no fear of naphthalene deposits in the pipes.

THE UNITED STATES STANDARD OF LINEAR MEASURE.—The actual standard of length of the United States, adopted by the Treasury Department and the Coast Survey, is the Troughton 82 inch scale, and the *standard yard* is measured between the 27th and 63d inches at the temperature of 59.6° F., although recourse is had to No. 11 and No. 57 whenever great precision is required. The United States standard yard is *identical* with the British imperial yard, notwithstanding statements to the contrary to he found in some text-hooks, works on metrology and kindred subjects.—Edwin P. Clark in the School of Mines Quarterly, New York.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Electricity.

Storage Battery Railroads.

So much has been said about the success of the Milford and Hopedale storage battery railway in Massachusetts that the official reports of Hartford citizens appointed to investigate the system will be read with great interest, says the *Western Electrician*. A local street-car company in the Connecticut capital proposes to ahandon horses and employ electricity as a motive power, and before the desired corporate permission was given a committee of citizens was appointed to carefully examine the practical working of the storage battery line at Milford, with the idea of securing the best possible system for the city before making the final decision. Prof. Robb of Trinity College was secured to accompany the committee in the capacity of an electrical expert.

The citizens have now made their reports, and it is not surprising that a considerable diversity of opinion exists. All the gentlemen were disinterested, and all entered upon the investigation with the hope that they could conscientiously report in favor of the storage battery as a practical, commercial factor in street railway work. Nevertheless, the only one of the party trained in the study of electrical problems felt compelled to report adversely on the system, the majority of the committee recommended the new system in guarded terms, but insisted that the Hartford company should also equip its line for the trolley system to be prepared for a failure of batteries, while only a mlnority of the committee declared unreservedly in favor of the employment of accumulators.

On the whole, the result of the investigation made for the benefit of Hartford must be regarded as unfavorable to the storage battery system despite the rose-colored reports of the achievements at Milford, which have from time to time been published in the daily press. The opinion of Prof. Robb will carry much weight, especially in view of the fact that the management of the Milford and Hopedale company denied him the the privilege of making a careful series of tests of the storage cell employed, for the purpose of determining its efficiency and durability. This refusal on the part of the company will certainly be taken as an admission of weakness by the general public. The professor also doubts whether it is practicable to carry enough energy on a car tn propel it, heavily loaded, up a stiff grade in rainy or winter weather — conditions which, of course, must be anticipated. He also wisely points out the present condition of the litigation over storage battery patents, and warns the public of the danger of interference on this score. Many of the members of the committee seem greatly taken by the smaller initial cost of the storage battery system by reason of the absence of poles and wires. Insufficient attention, however, appears to have been paid to the comparative charges for maintenance and renewals of the two systems, and the fact that the earning power of the trolley roads is greatly increased by the ability to attach trailers to the motor cars, which does not seem to be possible with storage battery propulsion, appears to have been entirely lost sight of. The figures presented in the report are far from convincing us that the storage battery system is the most economical of the two, when relative earnlng power is taken into consideration.

Everybody would hail the introduction of a practical, every-day, rough-and-ready storage battery system for the propulsion of street cars, with joy. How delightful to spin along in rapid-going cars actnated by a hidden source of energy, self-contained, with no smoke or cinders, laboring animals or landscape-disfiguring poles and wires! Rapid transit would then become ideal, and the New York newspaper men would be forced to abandon their "deadly trolley" cry and seek some other hugaboo to alarm the public. It is a pleasing prospect, but we fear that we have advanced but little toward it as the result of the first disinterested public investigation of the line at Milford.

LIGHTING CARS.—At the conclusion of a number of preliminary experiments, the Northern Railway of France has decided to make further experiments on a larger scale in the matter of lighting railway carriages by electricity on the Paris Lille line. Each car is lighted by means of lncandescent lamps of six, eight or ten candle power, run from a secondary battery; but, as a reserve ln case of break-down, the carriages can at need be lighted by oil without interfering with the electric plant. Each battery of accumulators has 16 elements inclosed in pairs in portable receptacles, which are placed in a wooden box suspended from the frames of the carriages and are easily accessible from the footboards. Each cell of the accumulators consists of an ebonite vase, and contains four negative and five positive plates, which measure eight by four inches hy one-fourth inch thick. The weight of the cell is about 28½ pounds, and the total weight of each battery is about 530 pounds, to which should he added that of the wooden case on the carriage into which it fits. The cells have each a capacity of 114 ampere hours when fully charged. The lamps work at a potential of 30 volts, and are fixed with thelr reflectors on the roofs of the carriages. —Chicago Journal of Commerce.

Testing Coal by Electricity.

It is not, perhaps, too great a flight of imagination to assign this title to a method which W. Hempel has recently devised for use in determining the character of coal. Sulphur is a troublesome constituent which the gas companies would rather have absent from than present in the coals; moreover, it seriously impairs the quality of the gas produced. The "monopolists" recognize *now* that they must strain every point in order to produce good gas; this has been forced upon them by competition, hence in this respect, too, electricity has done the public good service. W. Hempel is one of the leading authorities on coal-gas in Germany, and he has recently adopted a method, first devised in more complex form by Berthelot, whereby the sulphur in coals may be estimated, and hence their suitability for gas-making determined before purchase. In doing this he has taken advantage of the cosmnpolitan aid which electricity offers. The coal to be tested is powdered and pressed into a little platinum wire cylinder, to which a long platlnum wire ls attached, and then burned. The combustlon is effected in an ordinary glass bottle, which is fitted with a trebly perforated India-rubber stopper. Through this passes a tube with a glass stopcock, and which widens out into a cylinder; also two glass tubes, to the lower ends of which are fused two long thick platinum wires. One of these wires carries the little platinum cylinder or basket already referred to. A little mercury is poured into the tube so as to establish sure contact with wires which lead the electricity. When the current is passed the platinum basket becomes white hot, the combustion of the coal is effected, and the gaseous products con taining the sulphur compounds are led off through the stopcock and examined chemically. This method is exceedingly neat and gives, it is said, very satisfactory results, which enable the character of the coal to be accurately determined.—London Electrical Review.

Cable and Electric Traction.

The relative advantages of cable and electric traction under different conditions is strikingly illustrated in the lines of the California Street Cable Railway Company and those of the San Francisco and San Mateo Railway Company. In one case we find 11 miles of track on which an average of 45 cars a day are run by cable, at a cost of little more than $1 per car for fuel, while in the other case by electric power the fuel costs $3.20 a day per car for 25 cars on 20 miles of track. In both cases triple compound condensing engines are employed, the average daily horse power for operating the cahle line being 350, that for the electric 800. And yet the conditions are such that it would cost more to operate the electric line by cable than it does by electricity, and the cable line could not possihly be operated at all by electric power. The cable system embraces two lines which cross each other midway from their terminals, at which point the power-house is located, so that It requires only four ropes to operate the lines, neither of which is excessively long, while the grades are very numerous, and range from 14 to 21 per cent. The electric line is 14 miles in one general direction, so that were lt to be operated by cable it would require two power-houses, and the alignment is such that the curves would consume a large amount of power; it would require a double track all the way, and with a headway of only 20 minutes as now on the suburban end, would make the cost per car by cable traction exceedingly high.—Street R. R. Journal.

PULLING UP ROOTS.—One of the most useful agricultural appllances that has been devlsed for the clearing of new land is the root puller, and many years of labor have been saved in this country by its adoption. The record for both efficiency and economy is likely to be broken by a root grubber worked by electricity, which has just been brought out in England. On account of the advantages to be gained from the water power, a manufacturer has established his works on the hanks of the river Darenth, in Kent. When first acquired, the works consisted of a ruinous and delapidated old flour mlll, hut it took only a short time to make them remunerative. The water gives the power for a generating plant, as well as many other machines connected with the factory, which is lit by electric light. A second generator is used for experiments in electrical plowing, threshing, etc. The owner of the factory is an enthusiast in these matters, and thinks electrical agriculture has a great future before it. A third dynamo is used for generating current for supplying the gruhbing apparatus at the top of a hill two miles distant. The current is taken by overhead wires on telegraph poles to the motor on the grubber carriage. At the top of the hill several acres have been already gruhbed. The ground is being cleared for the purpose of constructing one of a series of large forts for the protection of London.

Useful Information.

What Is a Horse Power?

One-horse power is the power needed to raise 33,000 pounds one foot in a minute. This is a plain statement, and the inference to be drawn from this statement, that to raise a larger weight in the same time or to a greater distance will require a proportionately larger amount of power, is also plain to any comprehension; and yet no term used commonly in mechanics conveys so indefinite information as the term "horse power." Why? Because cause and effect are mixed up. A 10-horse power engine may be used with an effect of but one-horse power, while the same engine may be worked up to double lts rating.

How much power am I using in running a certain machine, and how can I estimate it? Circumstances will alter cases. You can estimate it from the coal you are burning under your boilers; you can measure the amount of water you are using to turn your water-wheel, or in the case of simple work like pumping, you can figure out the amount of work done, *i. e.*, the actual number of pounds you have elevated a given number of feet, but the three methods, as well as a number of others which will occur to the mechanic, will differ in results.

In considering such a problem, first make up your mind what it is you wish to know, *i. e*, do you wish to know how much power you are using to do certain work, or do you want to know how much result you have got? Thus if 33,000 pounds raised one foot high is the equivalent of one-horse power, how many horse powers have I used in raising my tank full of water, which is, say, 30 feet above its source and which holds 330,000 pounds of water?

Disregarding friction of the waterflow through the pipes, you have got the result of one-horse power continued for 300 minutes. Now, if you wish to fill this tank once in 24 hours, and can surely run your pumps for ten hours, you will need but a one-horse power engine to do the work, as you have to ohtain but a theoretical result of five hours' work. Still no account was made of friction, and it did exist. If it did not exist, it would be true that a water-wheel attached to the tank would yield a horse-power for the given time, five hours; and this same wheel would actuate the pump and return all the water to the tank again. It ls probable that a well-arranged water-wheel and pump would return over one-half; but a one-horse power engine which could be operated 10 hours each day, if necessary, would be none too large.

In most cases the horse power used could not be so easily or accurately estimated as in this one. Take the case of a large mill with a multiplicity of machines, to which it is proposed to add one. How much power will it call for? In this case one must estimate from the belt which the maker of the machine says is necessary. Now we find that the different authorities give different rules and the result will vary widely according as we use one or another. It does not seem as though they should, but a little consideration will make plain the wherefore. The circumference of the ordinary saws in our sawmills ordinarily run about a mile a minute. No one would expect, if the speed should be reduced one-half, to be able to do one-half as much, and, as a matter of fact, it would require much more than half the power to cut one-half the hoards. It ls easy to account for this by saying that the momentum of the high speed helps, but as this momentum is gotten from the source of power, it is not too clear where anything is gained or lost. Still the obvious fact remains, and thus accounts for the varying results gained by figuring by one authority or another. They made their rules by the observing of widely varying circumstances.

If I was a mill manager and was interested in the subject, I would take some standard authority, and after figuring all my machinery by his rule, add the results and then compare with figures obtained from my source of power. Thus I might find that my woolen mill, according to my standard, was nominally using 100 horse power, while figuring from the amount of water I was using on my water-wheel I was really using 120-horse power. With such a result as this it would be advisable to call in a water-wheel expert and see if my wheel was giving as good results as I ought to get. If the wheel was all right, add 20 per cent to all results galned by using the adopted standard, and justify yourself by assuming that probably the expert whose rules you are using made his rules from data gained from observing a differing class of machinery, which ran at a higher or lower speed.

It would be well, lf possible, to follow the rule of some expert who made his rule from data gained from observing the same kind of machinery you are using, but in default of this the way suggested will give very accurate results. For a rule which is the average of many experts, Haswell gives the following: Multiply the width of the driving belt in inches by the number of feet it runs per minute and divide by 1000, the answer being the horse power.—Fiber and Fabric.

The Care of the Hair.

The best hair-dressers tell us that it is quite an easy matter to wash the hair too often and thereby destroy the vital oils essential to its growth. The use of bay rum or any stimulants, or of borax or alkalis of any kind, is condemned by some of the authorities. One of the best things for washing the hair is the white of an egg, which is especially nourishing on account of the albumen which it contains. It should be rubbed thoroughly through every part of the hair and rinsed out with tepid water. It will require repeated rinsing before the water runs clear, but not until then is the process thoroughly accomplished.

When applying the white of the egg, ruh it on with the tips of the fingers, touching every part of the scalp, and continue this vigorous manipulation of the scalp for several minutes. Where any soap is used, the best quality of white castile is alone allowable. Some hair is so naturally dry and free from oil that a little pure vaseline should be applied after it is washed and dried. Other hair possesses enough natnral oil in itself and does not require any such addition. Where the hair has become dead, or does not grow vigorously, a preparation of rum and quinine or some of the various tonics of quinine sold by trustworthy hair-dressers will be found valuable.

There is an excellent one which has in it a portion of oil of neroli or the essential oil of bitter oranges as a component part. This gives a refreshing fragrance and is possessed of valuable tonic qualities. The hair should be clipped monthly. This assists the growth materially and stimulates it.—New York Tribune.

Care of Boilers When Not in Use.

For the preservation of boilers when not in use an order has been issued to the French Navy, which is thus abstracted in the "Journal of the American Society of Naval Engineers:"

On hoard all ships ln the reserve, as well as on those which are laid up, the boilers will be completely filled with fresh water, and this is to apply to shell boilers as well as to those of the tubulous or pipe type. In the case of large boilers with large tubes there will be added to the water a certain amount of milk of lime, following the instructions furnished by Bellville & Co., for the preservation of the tubes of their hoilers, or a solution of soda may be used instead. In the case of tubulous boilers with small tubes, milk of lime or soda will be added, but the solution will not be so strong as in the case of the larger tuhes, so as to avoid any danger of contracting the effective area by deposit from the solution; the strength of the solution will he just sufficient to neutralize any acidity of the water.

Care must also be taken to preserve the outside of the steel or iron tubes in the case of boilers which are not to be used for long periods. To this end they will be painted with red lead or coal tar as far as it is possible to reach. For those places which are inaccessible, a protective coating will be obtained by burning under the tubes a certain amount of tar or coal tar, whose smoke

will form a coating of soot and thus prevent the air from reaching the surface of the tubes. In addition, the boiler casing will be closed and kept air-tight after placing inside some quicklime. Periodical inspections of boilers thus treated will be made, to assure the complete filling of the tubes with water. Power.

THE influence of the moon on the barometer is dealt with by Mr. Bornstein in a recent article in the *Meteorologische Zeitschrift*. He refers to the question as to whether there exists any relation between the pressure of the atmosphere and the altitude of the moon. This study is hased upon observations made at four different stations in Germany and Austria, and does not take into account the phases of the moon orher distance from the earth, but in 1859. Gold has been to the settlement of the Pacific coast and to the opening of the Rocky mountains what the illusions of life are to us all. They lead us to different bnt greater things. The real wealth of California and of Colorado is in the harvest of their fields, but it required the glittering attractions of gold and silver to bring in the populations which were 10 find independence and wealth in prosaic hushaodry.—Watchman, Boston.

THE NEW AUTOMATIC GAS METERS were exhibited to the shareholders at the annual meeting of the Ipswich, England, Gas Company. These meters will be gratuitously supplied to any house as soon as a sufficient number can be obtained, and, by dropping a penny in the slot, the customer obtains 25 feet of gas, or enough to supply a good light for five hours. In the course of the meeting, the vice-chairman said that nearly 5,000 of these meters are now fixed in Liverpool, and he helieved they would have the effect of inducing artisans and small householders generally to adopt gas as an economical substitute for any other light or heating power yet introduced. Several artisans in Ipswich had had the meters fixed in their houses, and two of them had told him that the gas supplied in this way was cheaper than oil.

THE amount of sleep needed hy cbildren is in inverse proportion to their ages, and in direct proportion to their mental and muscular activity. Thus, the younger the scholar is, and the more actively he exercises mind and body, the more sleep he requires. During the whole period of growth the child needs a longer nigbt's sleep than does the adult. Many parents seem to he entirely unmindful of this fact, and the requirements of some schools which necessitate or encourage more home study equally disregard one of the prime requirements for tbe present and future welfare of the cbild. The bloodlessness, weakness and bysterical excitability that characterizes the young lady of modern life, who is neither well nor ill, are due mainly to her bad habit of takiog too limited a supply of sleep at irregular hours.

A PROMISING INVENTION in telephone circles is the "nickel-in-the-slot" telephone, one of which has been placed in Willis' hotel, at Wilmington, Del. All you are compelled to do is to drop in your nickel, dime, or whatever it may he, and the telephone does the rest. Slots are made for a nickel, dime, a quarter, half-dollar and a dollar. When either of the above denominations is dropped in the slot, the telephone rings at the exchange, and then the operator knows how much money has been dropped in the slot and how long and to what point the person is entitled to talk. The invention is gradually finding a field of usefulness.

ALL rooms containing water closets, or other fixtures grouped with them, should be specially ventilated. It is a good plan to keep a small gas jet burning in the outlet of a special flue, in the ceiling of a hathroom, proper provision being made for the inflow of pure air from the outside at some point near tbe door.—Prof. F. O. Marvin.

Educational.

Belmont School.

BELMONT SCHOOL, most deligbtfully and advantageously located 25 miles south of San Francisco, prepares for any college or school of science. The consolidation of the Hopkios Academy with it brings $56,000 to the $100,000 already invested, and so greatly adds to the resources of a school already well equipped as to place its permanence and its ability to offer the best and the broadest instruction beyond question. Twenty scholarships invite earnest and able young men of slender means. A gymnasium and athletic grounds, unsurpassed by those of any secondary school in the entire country, under the direction of the present physical instructor in Williams College, insure unexcelled physical training. The school invites inspection. References required. For Catalogue address, W. T. Reid, A. M. (Harvard), Head Master, Belmont, California.

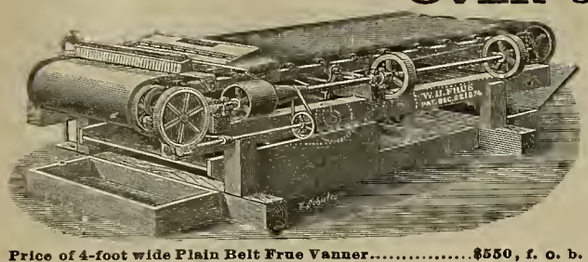
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

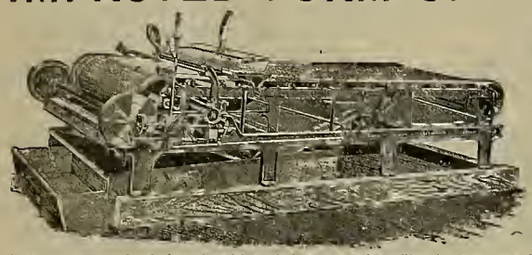
No. 132 Market Street, - - San Francisco, Cal.

IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illustrates the "**TRIUMPH" CONCENTRATORS,** and shows the recent improvements which have been introduced into their construction, by which many advantages are gained over any other form of Vanners, Vanning Machines or Concentrators.

These advantages are obtained by reason of the fact, as will be observed, that the crank-shaft is now placed and fitted at the head of the Concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting rod and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brasses have also been very much improved, making them stronger, simpler and more easy of adjustment. Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all parts of the machine stronger, more accessible and as easy of regulation as is possible.

We furnish the "TRIUMPH" Concentrators with either the plain or "Blasdel" Riffled Belt and shall be pleased to quote prices with the adaptation of either, as may be requested, and shall further be pleased to show one of the improved form, set up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentlemen:—Following the testimonial letter which I addressed to you December 9th, 1890, in relation to the superiority of the "Triumph" Concentrators over either the "Frue" Vanners or "Woodbury" Concentrators for concentrating our Texas ores, I hold now to the opinion then expressed; and with nearly two years and a half further experience in their operation I can confidently assert and am more fully convinced than then, that the "Triumph" Concentrators are better in all respects than any other form for concentrating our Texas and Bully Choop ores, and in evidence of such confidence I refer with pleasure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) stamp mill at the "Cleveland Consolidated Mining Co.'s mines in Bully Choop Mining District in Shasta and Trinity Counties, this State, and I feel assured that the improvements lately introduced into their construction will make them even better than the old form which I have had in operation for so many years past in the different mills under my supervision. I am, very truly,

(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cons. Mining Co's.

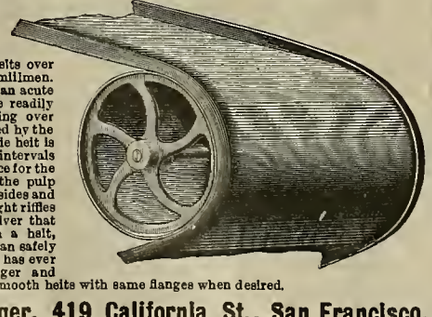
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

SOUTH EUREKA —*Ledger*, July 14: The South Eureka mine, located on property which was partly on the Vandament and partly on the Tanner ranches near Sutter Creek, is one among the few which is being prospected on a sensible and business-like plan. The property was opened up about two years ago, Jackson Dennis of Sutter Creek, Dr. J. Mayon of Oakland, and J. F. Parks of the Kennedy being the chief owners, though at the present time the stock of the company is held by a number of other people. J. L. Mayon is president, J. F. Park superintendent and Andrew Riley foreman. The company supplied itself with the necessary machinery from the defunct Hex mine in Calaveras county at a reasonable figure, putting in a hoisting plant capable of sinking 1000 feet. Their power is transmitted by wire cables from the water-wheels near the road to the top of the hill where the hoist stands, giving them abundant power. The shaft was carried down 500 feet, when crosscuts were run and the ledge struck, showing a very fair percentage of gold. It was then decided to go to the 800-foot level and tap the vein from that point. A short time ago they reached this point, and then concluded to carry the shaft down 200 feet more before crosscutting into the ledge matter, and they are now engaged with this work. The South Eureka are working in the proper manner. They propose to find their mine and do their prospecting before taking out rock and putting up a mill and other expensive machinery. It is a great detriment to the mining industry of the mother lode that so many companies have erected expensive mills and other works before a mine was found.

AMADOR GOLD MINE.—On July 10th a suit was begun in the Superior Court by the Amador Gold Mine, a corporation existing under the laws of the State of California, against the Amador Gold Mine, Limited, a corporation existing under the laws of Great Britain. This action is brought by the American people against the English contingent to secure undisputed possession of the property of the Amador gold mine located near Jackson. The American people sold the property to the English company, placing the deed in escrow, there to remain till the money was paid, but through the machinations of those who manipulated the sale the deed was delivered and no money paid. The American company, of which Martin Jones is president, feeling that there are equities in the case, has instituted this action to secure their rights in the matter. Lindley and Eickoff are the attorneys for the plaintiff in the action.

IN FINANCIAL TROUBLE.—The Clinton Consolidated Mining Co. is again in trouble. This time the firm of B. & M. Isaacs has placed an attachment upon their store for something in the neighborhood of $1000 for goods delivered, and S. W. Bright has placed an attachment on the mine for meats furnished in the sum of $194, and J. J. Thomas of Amador, who formerly conducted a butchery business here, has put an attachment on for nearly $300 owed to him also for meats. A San Francisco firm has also attached for something like $1500. The mine has struck a financial squall very often during its career, but has always managed to pay up and continue work. What the result of the present complications will be it is impossible to predict.

ANDAYE BIG.—C. L. Newton, of Woodbridge, one of the owners in the Mason mine of Jackson recently had some rock from that property assayed. The returns showed that the quartz per ton contained $22.15 in free gold and the sulphurets went about $75.

NOTES.—Chas. Mitchell is arranging for the formation of a company to develop his Calaveras mining property. The Littlefield tunnel on the Albany property is being pushed forward, stringers of quartz being daily encountered. Dr. Bardoe, owner of the Amador Queen, No. 2, is on the ground and has men cleaning out the works preparatory to working the mine. Recently the Kennedy people put in two additional concentrators, and they are so well pleased with their work that they are now grading for four more back of the mill. The Argonaut Mining Company has purchased the Pioneer mine, and the work of preparation for its development is going on as rapidly as the circumstances will permit. The Farrell tunnel is being pushed forward as rapidly as three shifts of men can do the work. It is rumored that the Farrell people contemplate erecting a five-stamp mill soon. The case of Mattley vs. Boxall has been settled out of court, and J. B. Francis, who now holds a bond on the property, has assurances from friends that a company will be organized in a short time to thoroughly prospect the property for quartz.

A GREAT MINE.—*Record*, July 15: During the past seven months the Kennedy gold quartz mine, which is located a trifle over two miles from Sutter Creek, has paid in dividends $350,000—or an average of $50,000 a month. If any of our sister mining counties in California can beat this we would be pleased to hear from them. Amador county has for many years past been famed for its bullion producers, and the record being made by the Kennedy shows that the list is not exhausted. Indeed, it is safe to say enough gold lies undisturbed in the hills of "Little Amador" to-day to brush away the present feeling of distrust in monetary matters that spreads like a pall over the entire country, were it only possible to put it in circulation.

Butte.

GOLD MINING.—Cor. *Call*, July 13: The mining interests in Butte were never more bright and promising than at present. The demand for gold has stimulated all classes of miners to renewed efforts in discovering mines and in pushing developments in those already being worked. A new mill was lately completed at Nimshew for working quartz, and the first two runs have been very successful. Colman & Paxton at Yankee Hill will erect a new quartz mill during the present season, and the rock is said to be exceedingly rich. Col. Frank McLaughlin and a New York company are sinking on the famous Banner mine near Oroville, which at one time was one of the richest ledges in California, and which is believed to contain a large quantity of rich quartz below where work ceased. D. K. Perkins will erect a new quartz mill at the Golden Summit mine, which has an altitude of 6300 feet, and is the highest point in Butte where any mining is done, if not the very highest altitude in the county. At Merrimac Mills the Palo Alto Company is engaged in setting up a large new engine and boiler for running the 20-stamp mill and will put in ten additional stamps as soon as they can be placed in position. The Phœnix quartz mill at Hurleton began running this week after a short close-down on account of lack of water. The company is making fine developments and sinking to a great depth. The lode proves wider and richer as it is descended upon. The Pactolian Company, near the same place, has 12 men at work, but recently found such a large body of rich quartz that the owners will now hasten developments by putting on 40 men. H. P. Stow of the Gold Bank mine at Forbestown owns a mine near Hurleton, and is pushing work upon it to open the mine and develop it before any mill will be erected. A French woman in the same vicinity has discovered a good lode and has with her own hands run a tunnel some 30 feet in depth to open the lode. The rock is rich but the vein not wide. At Wyman's Ravine Wheeler & Sons are sinking upon a gravel mine which they think will prove valuable. Near them Snyder Bros. are also opening a mine. At Wyandotte A. S. Parsons is working a vein of quartz and the rock is looking well. At Bangor there are five gravel mines being operated. The gravel is a hard blue cement and has to be crushed in arrastres before it can be separated from the gold. These arrastres are run by steam power, and two of the mines, that of the Catskill Company and the one known as the Blue and Gold, have taken out many thousands of dollars during the past six months. Some half-dozen other companies are making developments in the vicinity. The recent discovery of a rich pocket of quartz, from which over $1200 was taken in a few days, has led to quite an excitement in this line of mining, as several parties are searching for quartz lodes in the vicinity, while some old ones that were at one time abandoned are now being examined with a view of working them. At Forbestown the most extensive and costly quartz developments are being made. The mines there were worked at one time and then abandoned, as the rock contained sulphurets to such an extent that it could not be profitably worked under the processes then in use.

A few years ago these mines were reopened, and extensive developments have been made during the past two years by W. W. Stow and Alvinza Hayward. The former has a 40-stamp mill, which is considered one of the finest on the coast. The most modern scientific appliances are used for saving the sulphurets, and the rock is paying well. The mine has been so extensively opened that it is claimed there is ore enough in sight to last for ten years. A large force of men is employed, and the rock is paying so well that it is said the mill will again be enlarged, though 20 additional stamps were put in this season. The mill and mine are lighted by electricity, and the machinery is run by water power. H. P. Stow is the manager, and has shown remarkable capacity in bringing the mine into the high state it now occupies. Mr. Hayward has erected a splendid mill and the largest reduction works in the northern part of the State. These works are now ready to begin operations. The lode has been sunk upon to a depth of 500 feet, and the rock constantly increases in richness. The famous Sierra Buttes Company that owns the Plumas Eureka mine in Plumas county, the Sierra Buttes mine in Sierra and the Uncle Sam mine in Shasta has bonded the Reasoner mine at Forbestown and set 12 men at work developing the lode. If the rock proves satisfactory when the ledge is opened to a depth of 500 feet, the mine will be purchased and a large mill erected. The Williams mine is another valuable property near Forbestown, but no ore is as yet being crushed. The Carlisle lode is one of the largest and finest in the State, but it has been in litigation for some years and a suit is now in progress to quiet the title. Forbestown is making rapid development, and 25 new buildings have been erected during the past two weeks.

Inyo.

SOUTHERN INYO. — *Register*, July 13: Jake Faleetine came up Tuesday from southern Inyo and reports nearly all work suspended in the line of silver mining in that section. The Modock and Minnietta mines are closed, except that one or two men are working on lease. Some prospecting for gold is being done in Mountain Spring canyon, about 30 miles south of Darwin, but little else is being done. A few men are still at work in the Defiance at Darwin. The Newtown Company at Cerro Gordo has discharged its force, and Boland has also paid off.

Mono.

MOONDAY.—Bodie *Miner*, July 14: Messrs. Cameron, Kelly and Graham have made a run of about 60 tons of Moonday ore at the Bodie mill, and when the clean-up is made they will no doubt find themselves much better off financially. We learn that no sale of the Ward mine has yet been made. Mr. Ward resumed work at the mine yesterday, and will at once make preparations to mill a quantity of ore which he has on hand.

THE STANDARD MILL.—Bodie *Miner*, July 15: The familiar toot of the Standard mill whistle is no longer heard, and many a miner will miss its sound in the morning and will have to rely upon other means of waking up in time for work. The mill is now run by electricity, and everything is working smoothly and satisfactorily. By the substitution of electricity for steam as motive-power, it is thought the company will make a saving of about $18,000 a year in fuel and lights.

Nevada.

LIVE OAK.—Placer *Republican*, July 12: The Live Oak Consolidated quartz mine, situated near Wolf, about midway between Auburn and Grass Valley, and in which a number of citizens of Placer and Sacramento counties are interested, is giving promise of becoming an excellent property. The ore body is large and runs $32 to the ton in milling tests. An eight-stamp mill has just been erected on the property, and will be started up in a short time. The ledge has been thoroughly prospected and the owners believe that a bonanza is in store for them. Such level-headed Sacramento men as A. Meister, J. Goethe, Thos. Rndech, John Miller and J. A. Moffett are interested in the mine.

GOING TO MEADOW LAKE.—Nevada *Transcript*, July 12: Mr. Maxwell, who arrived here a short time ago to look at our mines, will go to Meadow Lake soon to examine the famous Excelsior mine, which property belongs to Mrs. H. H. Hartley. If satisfied with the prospects, he will arrange to work the mine. The Excelsior is regarded as the richest mine in the district. In years past "Old Man" Hartley took out considerable gold from this ledge. It is claimed that the rebellious ore can be successfully worked by some of the present processes, thus overcoming the difficulty that has hitherto been encountered in the treatment of Meadow Lake ores. Mr. Maxwell will investigate.

THE EAGLE BIRD.—The Eagle Bird mine at Washington is said to be looking better than it has for a long time. On the 600 level the ledge is 14 feet wide and the rock that comes from it pays well. The ledge on the 400 level is looking better, and the outlook at the mine is very bright. We understand a syndicate has been formed for the purpose of buying and working some of the undeveloped mines in Washington district and that they will soon be ready to begin operations. The prospects are good for prosperous times in that section in the near future.

THE MAYFLOWER MINE.—*Transcript*, July 14: For the past 10 or 12 years the owners of the Mayflower quartz mine, which is situated on Canada Hill, have been steadily opening up and developing their property. At different times there has been remarkably rich rock taken from the mine, but the extra rich quartz seemed to be in spots. The ledge would vary in size and the quartz in richness, and although at times the outlook was very blue, yet the plucky owners kept the work going steadily on. They had many obstacles to contend with, but they felt satisfied that there was a good mine there and kept digging away, sometimes finding bright spots that paid them well and cheered them to keep on. Lately the prospects at the Mayflower are better than they have ever been. Very rich rock is being taken out and the indications are that the mine will soon be one of the regular dividend-payers of this district.

Shasta.

A GOLD STRIKE.—Dispatch to *Examiner*, July 11: A discovery which promises to be the richest strike ever made in northern California was made about 30 miles from Sisson, on the north side of Eddy mountain, by William Dale of this city. It transpires that about four years ago some very rich float was found in the neighborhood of the present find, which proved to be very rich in gold, some samples of which assayed as high as $600 to the ton. H. B. Maxwell, a partner of Dale, forwarded some of the ore to an assayer in Oregon, and soon afterward they both left the neighborhood, not knowing how valuable a discovery they had made. The assayer immediately recognized the importance of the find and came on to Sisson to find Dale and Maxwell, with whom he went in partnership for the purpose of prospecting for the main ledge, which was recently found. Matters have been kept quiet and an eight-foot shaft has been sunk, which has laid bare one of the richest strikes of gold-bearing quartz ever found in the State. The ledge has widened from a foot to two feet and a half, and at one place eight inches is 80 per cent pure gold and which has to be cut out with a chisel. The lode can be traced for a mile in a southerly direction and lies in the center of the gold belt. A large delegation of citizens from Sisson and Igernia left Saturday for the scene of the new strike. The hills are full of prospectors and every inch of ground in the neighborhood is located. The owners were poor men, but have extracted in the neighborhood of $10,000 in gold from the quartz taken out. A dispatch dated July 19th, relating to this same strike, is as follows: The recent gold discovery promises to be one of the richest struck in this section of the country and has caused great excitement. It seems that the discovery was made accidentally about five years ago by Harvey Maxwell while riding through the hills. Some of the ore was sent to an assayer in Portland, after which the mine lay idle for one year. The assayer evidently understood the value of the find, for he sent a man down to hunt it up. The agent was unable to discover it, and he then searched for Maxwell, but could get no trace of him. Failing in these efforts, he informed Dale of what he was hunting for. Dale kept the matter quiet, but began searching for the lost mine and discovered the lead last winter after considerable prospecting, during which he traced the float for a distance of two miles. This summer a shaft was sunk over the ledge, which is widening out gradually with a pitch of about 30 degrees. The ore is very rich, consisting of sulphurets and free gold. The latest assay gives returns of $620 to the ton. There is a quantity of ore out now, but it has not been worked yet. It is the intention of the owners to put up a mill as soon as possible. Those interested in the mine are Dale, P. Keirnan and Keirnan's two sons, and they do not desire to take any others. Dale is locating several parties on claims in the vicinity and the extensions. Prospectors are coming in from every direction. Several placer claims which have been unworked for years are developing rich. The mines are located on the north side of Mount Eddy, 15 miles from Sisson and about two miles from Walbridge's mill.

Sierra.

SIERRA CITY.—*Mt. Messenger*, July 15: Mining interests are on the improve hereabouts, and prospects are rather bright for a prosperous future for this noted mining camp. Ten men are working at the Mountain quartz ledge, where considerable gold is being extracted. Geo. Pinney, one of the leading interested parties in this mining property, is expected to return here the coming summer. Fourteen men are employed by the Sierra Buttes Quartz Mining Co. Ten stamps are crushing ore at No. 7 mill. A number of men are busy at the Colombo quartz mine and mill. Eight men are working at the Chips quartz mine. Jos. Perry and Wm. Jenkins are hauling quartz from the Independence ledge down to Sierra Buttes No. 9 mill, where 20 stamps are crushing ore. A contract to run 600 feet of tunnel to tap the channel ahead of the present workings, will soon be let by the Gibraltar Mining Co., whose main tunnel is in 900 feet. The capital stock will be increased from 2600 to 30,000 shares. F. Trimpin is acting as secretary in place of Geo. B. Albee, now in San Francisco. At the annual meeting, held in Sierra City, the following-named officers were elected by acclamation for the ensuing year: M. E. Loeffler, president; E. Schoch, treasurer; F. Trimpin, secretary; John Sorracco, Adam Kieffer, E. Schoch, M. E. Loeffler and F. Trimpin, directors. Prospects are very flattering for a good-paying drift mine. About $30,000 has been expended thus far in developments. Jos. Carney returned Tuesday from the county seat. He is mining near Gold Lake, and his claims yield well.

Tuolumne.

ENCOURAGING. — Union *Democrat*, July 15: The Garfield Virginia mine still looks encouraging; the main tunnel is now over 100 feet in length on the course of the vein, and it is estimated that 75 feet more must be run before tapping the pay shoot, which, when properly opened, will prove to be a first-class milling proposition. This mine is situated on the banks of the main Tuolumne river, and an abundance of water for power can be obtained the year round at a small expense.

NEVADA.

Washoe District.

A REDUCTION OF EXPENSES. — *Daily Report*, July 19: As the *Report* has several times informed its readers in its stock articles, a general reduction in the cost of mining on the Comstock lode is soon to be brought about. There will be a very material scaling down in the salaries of all officials, from the highest to the lowest, and also in the cost of transportation, supplies of all kinds, the milling of ores, and, lastly, the wages of the miners. Those who are in charge of the movement say that unless the reductions contemplated are made the Comstock mines must soon close, for with silver quoted at such a heavy discount, and with most of the mines unproductive and searching for new bodies of ore, it will be impossible to collect assessments upon stocks which have receded in the average to prices which equal the amount of the assessments asked for, and in some cases exceed it. There are in the Comstock lode millions of tons of low-grade ores, which at reduced expenses can be made available, and can be worked at a profit. Much of this low-grade ore assays high in gold, so that the heavy discount in silver does not much affect it, provided that expenses can be reduced to a point where it can be profitably mined. Such ores abound in vast quantities in the Consolidated California and Virginia, Savage, Hale & Norcross, Chollar, Potosi, Yellow Jacket, Consolidated Imperial, Crown Point, Belcher, Overman and Justice mines, and are to be had in lesser amounts in many of the other mines. The reduction in general expenses now contemplated will amount in the aggregate to between $50,000 and $75,000 per month along the Comstock. Even with silver below its present quoted value the leading productive mines cannot only live, but be made to yield a profit with expenses so reduced. This, as already stated, is largely owing to the high percentage of gold in Comstock ores, amounting in some cases to 75 per cent. The agreement which the salaried officials of the Comstock in this city have signed will be sent to Virginia City tonight. The other reductions are expected to follow. Some of them have already been arranged. Regarding the Miners' Union, a well-known Comstock superintendent, who arrived here yesterday, said to a *D. R.* reporter this morning: "The boys have talked this matter over for a long time and thoroughly understand it. I believe the union, realizing the situation and seeing how all the other interests are giving way, will voluntarily submit to a reduction in miners' wages, which are now $4 per day, the same as they were in the palmiest days of the Comstock. There are now only

325 miners at work on the Comstock, and those who have left it find it hard to get employment at $2 and $2.50 per day. In the whole State of Nevada only 650 miners are now emuloyed and only 500 of those are drawing pay. If expenses are reduced. 1000 men will be put to work in the Comstock mines at $3 per day each, thns making good profits for several of the companies and iucreasing the chancee for striking new bodies of ore.

Osceola District.

GAAVEL MINING.—Sslt Lake *Journal*, July 10: The Osceola Gravel Mining Co. is working a large force of men in the mine, and also on its finnes, ditches and reservoirs. Next year it will be able to utilize its water twice by picking up the water after it has run through the mouitors and ruuning it into a reservoir and then conveying it by fiume and pipe monitore that will be put in place this year one mile below. Qnartz mining in this camp is coming to the front. The more development that is done, the more the mines improve aud show more of the yellow metal. A. J. Millick is working a force of men on the Cnmberland and Stamhoul mines. Mr. Johnson is working the Gold Quartz mine, owned by the Calnmet Co., and it is showiug up fine. Boou Tilford is workiug a force of men on his dry wash mine. Messrs. Hi" & Hndson made qnite an important silver and lead strike a few days ago, the assays ruuing 115 ounces in eilver. They have struck ore since that will go at least 60 per cent lead, and I thiuk much higher in silver than the dry ore. This find is in lime and close to the qnartzite contact, and is one of the best formations known for silver and lead ores.

Reese River District.

GLOOMY OUTLOOK.—Reese River *Reveille*, July 15: The situation in Austin and surrounding country is anything but favorable. When the bottom dropped out of silver a few days ago the Austin Mining Company closed down, and that put probably 200 men, directly and indirectly, out of employment. Since that time the streets have shown a gloomy state of affaire. On Saturday General Manager Farusworth arrived in town from Utah. When he left Utah he had resolved to resume operations on his arrival here, for silver was then 75, but when he got here it was 71 and his plans were all upset. The rumor now is that the fewest men possible to keep the property intact would be put on at $2 and $2.50 per day. We have no idea what the men think of this plau, except we think that it will be close figuring for a miner with a family to live in Anstin on from $55 to $70 per month; and we also think it will he difficult, if not impossible, for the company to make the mines pay at those wages, at the present price of silver.

Silver Peak District.

BAING WORKAU. — Inyo *Register*, July 13: Nicholas Stroesser, of this old Esmeralda camp, furnishes the following information: The Silver Peak group of mines, owned by John Blair of New York, is being worked hy men under Sam Wasson. The hreaking of a cam in the mill shut that down temporarily, but it was expected to start again this week, 10 stamps of the 30 in the mill being in regular use. About 200 tons of ore are now out, and mining will be resumed as soon as this is run throngh. Some 20 men are kept husy hy these operations. The group comprises 20 different mines, which are worked systematically bnt with the constant object of taking out only paying ore. The deepest work heretofore done in the group is not more tban 100 feet under grouud, and at present nothing is heing done lower than 35 feet down. Wood is abundant and water sufficient for the steam power used. The ore is gold, running about $25; $18 rock will meet expenses. The ore is packed two miles and hauled eight more to the mill. The nearest railroad point is Candelaria, 60 miles away. Johu Chiatovich is making a big thing out of the tailings which have heen accumulating at Silver Peak for 20 years past, using the cyanide leaching process on them. A little is being done at Lida and Tule Canyon, the latter heing chiefly placer work. Auy actiou favorable to silver would boom that section; as it now is, the only properties being worked are those yielding enough gold to pay of itself.

Silver King District.

THE FURNACA.—Pioche *Record*, July 13: Jack Wheatley was in town this week from Silver King dietrict. The furnace iu which he and his brothers are interested ie not completed, and the condition of the eilver market is such that it is doubtful if auything more will be done toward the erection of the worke this season.

Taylor District.

A MILL-RUN.—White Pine *News*, July 15: The Monitor mill was started up last Sunday on ore from the Taylor mines. The run will last about three weeks, and will probably end the company'e operation at Taylor for some time, if not altogether.

Tuscarora District.

DIVIMAND.—Tuscarora *Times-Review*, Jnly 15: The Dexter Mining Co. of thie district, which have just completed a successful run at the De Frees mill, yesterday declared a dividend (No. 4) of 25 cents a share. The Dexter has earned the right to be claesed as a gold mine, the ore carrying hut a small percentage of the white metal. The Dexter, with two or three other promising gold prospecte in the lower part of town, are the mainstay of the camp at preseut.

NAVAJO.—The stopes above the 150-foot level are looking about the same; those above the 350 are not looking ae well.

BALLE ISLE.—The eouth intermediate No. 2 ahove the 250-foot level has heen extended 5 feet; veiu small, but good grade. Stopes are looking as usual.

White Horse District.

FREE GOLN.—Reno *Journal*, July 15: Lonis Cohn, Will Biggs and B. Campbell have located a miue in White Horse district which promises to be valuable. Pieces of quartz from the croppings show free gold, and, when pounded up and washed by the old pan process, gives good resnlts. The White Horse mines carry very little silver, bnt samples of the ores brought to town are rich in gold.

ARIZONA.

WHITA HILLS.—Kingman *Miner*, July 15: The White Hills Company continnes to send in ore from their mines. Robert Gray and L. Kimerly are working on a claim near Stockton Hill and are getting some good ore. Logan's team got in from the Gold Bng mine Wednesday morning after hauling ont a lot of machinery for nse on the mine. The Clack Bros. have returned to work on the Prosperity mine, in Todd Basin. They will pile up their ore and await the raise in the price of silver. Ed Williams and Ed Mervine have qnit work on their miues in Aubrey district, the continued low price of silver having utterly disheartened them. Charles Sherman and John Barry were in town this week outfitting for a prolonged prospecting trip to Minnesota mining district. They expect to strike some good gold ledges. W. R. Donnell, H. M. Barry and Jack Kenny took a trip over the southeru part of the county this week. They say that they failed to find a single man at work in the mines of that region. It is said that a gold mill will soon be erected in Rnstler Camp, on the banks of the Colorado river, to work the rich ores of that camp. The prospect for a brilliant fntnre for that camp is good. Stinson & Collins have a spleudid showing of high-grade copper-gold ore in sight in the Blackfoot mine, near Stockton Hill. The ore is generally shipped to Newark, New Jersey, for reduction. Peter Caffrey is still working away on the Alpha mine and is takiug out good rock. This is one of the best properties in the district, and when silver takes an upward turn it will be worked profitably. Mix, Jackson & Cleve are working on an extension of the I. X. L. mine in Wallapai mountaius. They have a fine showing in silver, and it is to be hoped the white metal will go to standard rates to allow them to continue the good work. The hoist on the Rural mine at Mineral Park is in rnnning order, and the water is being pumped out as fast as possible. As soon as the shaft is cleared work will be commeuced on the lower levels, and sinking will also be pushed as rapidly as possible. B. W. Brown, of the Music Monntain Mining Company, has returned to Hackberry from Sau Francisco. He has four men at work developing the water supply at Music Mountain, and, as soon ae a sufficient supply ie obtained, he will start up the mill and mine. An effort is being made to have the Wallapai Iodian reservation, near the Grand Canyon of the Colorado, thrown open. The reservation is of no earthly use to the Indians, and the sooner it is opened up the better it will be for prospectors, as the mountaius in tbat country are filled with mineral. R. G. Patterson has purchased the whim used on the Crescent mine, and has put it up on the main shaft of the Prince Albert mine, at White Hills. He will coutinue to siuk the shaft to a depth of over 200 feet with the whim, and will then erect hoisting works to further prosecute exploitation.

MINING SALE.—Prescott *Courier*, July 13: The only transfer of mining property of any note in the Uoited States within the last 30 days took place last Saturday, when Chicago capitalists purchased a group of gold mines, 17 miles from Prescott, the purchase price being $100,000, the purchasere stipulating to have a complete 20-stamp mill in operation on the properties withiu four mouths. The properties purchased are the Yankee Girl and Silverton mines, owned by Meyer & Slack, and the American Flag and Invincible mines, owned by Messrs. Butler, Bliss & Kelly. The purchasers will take charge of the properties ten daye from date of purchase. The 20-stamp mill is to he erected on Big Bug creek, not far from the site of the Williscraft mill. These properties have heen among the most steady gold-producers and ore-shippers in this section, and euch a sale at this particular period of mining depression shows well for the gold belt aronud Prescott, as well as for tue good work of the men who brought about the sale. The *Courier* underetands that Wm. Vanderbilt and H. N. Palmer hrought about the sale, which has already added considerably to the amouut of money circulating in Precsott.

ACTIVA MINING.—Mesa *Free Press*, July 13: Active work is now being prosecuted on the Mammoth mine in Snperetition district. Thirteen men were put to work on Thursday taking out ore and others will be put on as rapidly as possible. The camp will he supplied with water from a shaft in which there is 15 feet of water. The pump aud machiuery are on the ground and will be put in at once. A portion of the 20-stamp mill is on the cars at Tempe and will be transported to the miue at once. Ore hy the carload is being shipped to Denver for reduction. The prospects of the district grow brighter day by day.

BRITISH COLUMBIA.

EAST KOOTENAY MINING NEWS.—Nelson *Tribune*, July 12: The concentrator of the Thunder Hill mine, on the shore of Upper Columhia lake, in East Kootenay, is in operation, and the first shipment of cencentrates was expected at Golden thie week. The East Kootenay Exploration Company now has its hydraulic plant in operation on Wild Horse oreek, and will run day and night until the end of the season. The grounds are illumiuated at night hy fonr arc lights of 1000-candle power each, the power being furniehed hy a Pelton wheel. The company employs 20 white men and no Chinese. The boud on the North Star miue, on St. Mary'e river, will expire soon, and the parties holding it are shoving work on the mine with the view of taking up the bond. Dau Maun, the railroad contractor of Winnipsg, is one of the parties interested. The McMnrdo basin is almoet free from snow, and the trail leading to it from Carbonate landing ou the Columbia river, 15 miles ahove Golden, is reported in good coudition.

SILVAA MINES NOT WANTAU.—W. A. Jowett, who went to England last winter to make a deal on mining property in the Lardo country, retnrned to Nelson on Monday, coming in from Bonner's Ferry on the State of Idaho. Mr. Jowett left England on Jnne 10th. He says it is uselese to attempt placing silver mines in England at present, not because of a scarcity of money, bnt because of the belief prevailing over there that silver has no stable value. While he did not meet any of the Silver King people, he heard of them. It is understood that the property is stocked, although the stock is not offered for sale publicly; it is being placed among personal friends of Mr. Ramsay. In England, money is locked up awaiting investment iu gilt-edge American securities at an opportune time, that is, when the price of the securities is dowu to bed rock.

DAKOTA.

HEAVY PLACEA MINING.—Deadwood *Pioneer*, Jnly 15: Further inqniry into the rumor of preparations for a system of extensive placer mining on Castle creek, referred to iu these columns Saturday morning, seem to verify the report as correct. A gentleman who was in from Mystic yesterday informs us that such a company as we referred to has really heen organized, with a working capital of $125,000. The company, he states, is made np of English capitalists and was organized by Donald Dennis. The operations will be begun near Mystic, and much of the machiuery is now ou the ground. The plan of operations, our informant states, is to build a large flume along the side of the stream, then build dams as the work progresses up the stream, and, by means of powerful steam pumps, pump all the water of the stream into the finme, thus affording a clear channel for the steam shovel to operate. It's a pretty big undertaking, and if it can be made to work there seems no reason why it should not prove profitable.

BALU MOUNTAIN GOSSIP.—Reports from the Bald Mountain country indicate a quite general livening up of matters among the prospectors, and more work is being done than at any previons time this season. The outlook is generally good, and in some instauces men who have been pegging away faithfnlly for a long time seem to be meeting with the encouragement they have so long been looking for.

THE HOASESHOE —Results in no mining property in the Black Hills are being watched with more general interest at present than in the Horseshoe group. This is natural from the extent of the property, embraciug some 400 acres, and the large sum epent in prospecting and developing it, the shaft being over 350 feet deep, with, at the present writing, 350 feet of drifting on that level. The drifts run east and west, the one to the east being in about 200 feet, and that to the west 150 feet. There hss been no material change in the property during the past week, by which is meant that no large body of ore has been struck. In all, five distiuct ore chutes have heen cut in the two drifts, bnt none of them have been followed any material distance. Thomas H. White, to whose energy is mainly dne the extensive work on this property, has been sanguine from the first that it holds an immense body of ore, and the resnlts thus far have in no measure weakened his faith. There are couditions in all miuing properties which owners do not always care to make public, and, while Mr. White can scarcely be asked to give a detailed description of the workings in his ground, he has said efficient to the writer to warraut the conclusion that he is well satisfied with the outlook, and those who have beeu hoping to eee the Horeeehoe develop into an important mine will in all human probability uot he disappointed.

NEW MEXICO.

DEVALOPMENT WORK.—Silver City *Enterprise*, Jnly 14: The Maud S. mill started up Wednesday. The Colonial mill at Mogollon resumed operations Wednesday. The Viola mine at Pyramid is working a force of 15 men, and ie preparing for the silver boom which is eure to come in the near future. Dave Darling has a lot of rich eilver ore on hand which he extracted from his Red Cloud mine at Black Hawk. He proposes having it worked at home if possible. The Mogollon mines continue to operate despite the fact that silver ie nnder a cloud. As one-third of the hullion product is in gold, thie fact may help that section out and euable it to tide over the period of depression. Work on the Confidence mill grade at Whitewater is about completed and operations on the wagon road will be resumed immediately. About 1½ miles of grading will be required to reach the mine, but as a good portion of it is hlasting ground, it will require some time to complete it. A rich gold strike is reported from Copper creek, in the Mogollons. W. J. Burns is the lucky man this time, and the original owners of the property on which the find was made have ample time to rnminate. It appears that the old owners always chose a soft spot, not on the ledge, where their annual assesement work was done. Had they made the mistake of sinkiug on the vein, and hy eo doiog developing that property, they wonld now be resting in ease and comparative affinence. The vein ie four feet wide, is well defined, and aseays show 18 ounces in gold and 3 ounces in silver.

OREGON.

GOLN FIALNS.—J. M. Hagerty in *Oregonian*, July 15: "After carefolly examining the various mining properties in southern Oregon, I have come to the conclusion that mining is only in its infancy in that sectiou of the State. In formation and climate it is an ideal mining couutry, and the cheapness of labor and provisions and the railroad facilities make it possible to operate mines with a comparatively emall outlay of capital. But it has been held back, and still is, to a great extent, by reason of a hostile feeling on the part of the old-timers, properly called 'mossbacks,' against quartz-mining. There was no qnartz-mining carried on in early days, and they do not believe in it. Then, too. there has been a great deal of mineral land fraudulently taken np under the timber and stone act, and they do not want it exposed. The country from Roseburg to Ashland was not originally settled by mining men, but by 'camp followers,' who, delighted with the climate, soil and the possibility of making a good living with little labor, squatted in the valleys and raised cattle and fruit sufficient for their own use, and were satisfied. Then the Oregon & California Railroad was built, bringing in new blood and new conditions; bnt the country was still agricultural. Since 1850, mining has been carried on on a small scale, except in one or two instaoces, nntil about three years ago, when a few prospectors from California aroused some interest in quartz-mining. But it has not been until within the past year that this new movement has received any real encouragement. Tbe development of the Ashland mine proved tbe fact that there were good-paying ledges in that section, and gave encouragement to a large number of prospectors. The majority of the ledges found, however, and espscially the larger ones, are either barren on top or so low grade as to be unprofitable to work. The owners of the Ashland mine are entitled to a great deal of credit, as well as the profit they are making, for the determined manner in which they continued the development of their property under what seemed the most discouraging outlook. The country between Jacksonville and Gold Hill is very rich in pockets. It is from that section that so many reports of rich strikes originate. There is no doubt that mauy miners have found pockets from which they have taken out from $500 to $5000 in a single day; but that does not mean that they have discovered a mine, for that single day's work, in all probability, has sufficed to entirely clean out the pocket.

UTAH.

GLOOMY OUTLOOK AT PARK CITY.—*Record*, July 15: The outlook for the miuing ioterests in Park City is rapidly assuming as gloomy an aspect as that reported from many other States and Territories, and it is hard to say just what the result is going to be. The situation may be summed up about as follows: The indications are that the Ontario and Daly properties will be kept working, though perhaps at reduced wages. A couference between Supt. Chambers and a committee from the miners will be held to-morrow or Monday and the question settled. At the present time, both mines and mills are working full force at the old wages and will continne so until after the conference between Mr. Chambers and tbe committee. The Crescent is closed down tight, and, owing to the fact that the smelters will uot purchase ore, and that money cannot be borrowed even ou gilt-edged security, tbe company is unable to pay its men off and is consequeutly feeding them at the miue boarding-honse until matters take a more favorable turn and the company is enabled to market the large qnantity of first-class ore and coucentrates that it has out and ready for shipment. The Crescent, under reasonable conditions, can pay its way, while recent developmeuts on the 400 level give great promise of placing the mine in a positiou to restore the confideuce of its many stockholders; but the present unexpected and disastrous drop in the white metal has practically throwu the mine on its beam ends and stopped all developments. The Alliance tunnel is uow ready to go over to the Crescent Company, but, owing to the present outlook, nothing will be done in the way of exteneion. If the Government destroys silver, there will he no occasion to extend the tunnel and tap the Crescent veiu at depth, and the company proposes to wait for developmeuts. The mine will not be opeued up again nntil there ie a change for the better. The Anchor has aleo closed down, the force that was put to work last week stoping first-class ore having eince been laid off. The mine is now silent, and will not agaiu resume until there is a change for the hetter and a permanent price, at leaet for silver, is established. The officere of that property claim that it is now, with fair prices for hoth eilver and lead, in a coudition to pay expenses and lay by a surplus for dividende, and it is much regretted that the present state of affairs should place a damper on developments. No attempt will be made to reeume until silver ie established on a permanent basis. Many improvements were contemplated hy the company, hnt have all been abandoned. The Silver King property is perhaps the hest equipped of any mine in the camp to extract ore at a profit under present conditions, yet the management claims it is an impoesibility, and the King is numbered among the eilent majority. Many exteneive improvements, among which was an enlargement of the present shatt to three compartments, were in contemplation, but has heen abandoned for the present. The Silver King is a great mine, but cannot work at a profit with silver at its present fearfnl discount, hence the mine will remain closed until hetter prices are obtainable. Many other properties are also closed down, owing to the eame cauee, and among them may he mentioned the Daly West, Mayflower, Apex, McHenry, three jigging plants and a whole raft of small prospects, employing from two to twenty meu, all helping to swell the number of idle men. Nearly all the promising prospects in course of development in this district have been closed down, the men claiming that it is folly for them to epend either time or money in pursuit of something that may never he of any value. The only one that remains active is the Cnmherland group, owned and operated by John Bogan and others.

Market Reports.

The Markets.

SAN FRANCISCO, July 20, 1893.

During the past 60 years the highest prices for silver bullion in London was in 1859, viz., 62¼d per ounce standard; and the lowest official quotation was 30½d, on June 30, 1893. The Sherman law requires Government purchases from time to time of silver bullion "to the amount of 4,500,000 ounces, or so much thereof as may be offered, in each month, at the market price thereof, not exceeding $1 for 371.25 grains of pure silver," etc. It is not obligatory, therefore, on the part of the Government, as commonly supposed, to purchase 4,500,000 ounces in each month, unless that quantity be offered at "the market price." London determines the price, and the Government rejects all bids not in conformity with the same.

The compulsory purchase in each month of 4,500,000 ounces would mean an absorption of 54,000,000 ounces annually, says the *Examiner*. Only since 1889 has the annual production of silver in this country exceeded that amount. The year in which the Sherman law was passed, 1890, the production rose to 54,516,300 ounces and to 58,330,000 ounces in 1891. In 1892 there was a small falling off. From 1793 down to 1873, the year in which the coinage of the old silver dollar was suspended, only 8,045,838 of these pieces were emitted. The coinage of 412½ grain dollars was resumed March 1, 1878, and down to March 1st of the present year 418,931,675 had been coined. During the first year after the silver dollar had been restored to currency, more than three times as many were coined as during the 80 years in which the old dollars had their run. The latter, owing to their being intrinsically more valuable than the gold dollar, were either exported out of the country or melted down.

The Metals.

Tin has shown greater strength during the week. Copper and lead have shown no important changes.

Mining Share Market.

The mining stock business just now is even worse than most other kinds. Prices are about as low as any one could wish. There is a desire on the part of the managers of the mines to put them on a better footing, and, if this had been carried into effect a long time ago, affairs would not now be so bad. The presidents, secretaries, superintendents and other head officials of the companies have voluntarily agreed to submit to reduction in their salaries, and the railroad, the mills, the supply companies and the miners will be asked to make a reduction in proportion. If this is done, there will be a revival on the Comstock such as it has not had for years, for a class of ore which cannot now be extracted, and which runs high in gold, can be profitably worked, thus giving employment to more men, and making assessments few. The greatest difficulty will be experienced when it comes to cutting down the men who do the real work at the mines. The underground men earn all they get. At the same time, rather than give up work altogether, they may have to accept smaller wages.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

The following brief list by telegraph, for July 18th, will appear more complete on receipt of mail advices:

California—Elton B Shaw, Los Gatos, evaporating pan; Geo. r. Volght, Lower Lake, swinging gate; Matilda S. Broun, Berkeley, detachable umbrella cover; Augustus Knudson, San Francisco, steam engine; William P. Courtney, Oakland, grip opener; Lee D. Craig, San Francisco, removable sidewalk for cars; George Simpson, Santa Barbara, dental articulator; Joseph W. Holmes and F. C. Gilmore, Los Angeles, root block; Bernard Toulouse and J. Delorioux, San Francisco, mosaic and tile press; James S. Brownell, San Francisco, bolt for ore concentrators; William F. Bowers, San Francisco, guide support for hose reels.

Oregon—John F. Needham, Mount Tabor, steam boiler furnace; Thomas B. McDermott, Portland, car coupling.

Washington—Charles J. Best and W. A. Hall, Seattle, two patents for apparatus for treating garbage or like wastage; Olans B. Jacobs, Fremont, car axle bearing; William H. Crain, Penawawa, spring gun.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAS-GENERATOR. — James Nolan, Oakland. No. 500,936. Dated July 4, 1893. The object of this invention is to provide a simple and effective gas-generating apparatus, and particularly one which, by reason of its reversibility is capable of continuous operation.

LAND-LEVELER.—Wm. Falconer, Selma, Fresno Co. No. 500,874. Dated July 4, 1893. This earth-scraper for leveling land consists in a scraper-carrying frame constructed and adapted to be readily and quickly applied to the running gear of any farm or other country wagon, said frame having novel mechanism for lifting and depressing the scraper. The object of the invention is to provide a land-leveler which can be readily, easily and quickly applied to the running gear of any ordinary wagon by simply removing the bed, uncoupling the reach and setting the scraper-frame on the wheeled axles; also to provide a land-leveler having a peculiarly mounted scraper with simple and convenient means for raising it from and for depressing it into the ground.

AIR MOTOR.—John P. Foulks, Verdi, Nev. No. 500,877. Dated July 4, 1893. The object of this invention is to provide for the unlimited application of the force of the wind to drive a series of double wheels, and apply the power to a continuous shaft, so that the power may be increased by adding any number of wheels and connecting them with it. In carrying this out the inventor uses a series of horizontally journaled double wheels, situated one above another in one or more towers, and which are revolnble upon a central hollow axis for the purpose of presenting the wheels with their faces to the wind or throwing them out, and a central shaft extending through these hollow shafts receives motion from the wind-wheels through suitable gearing, the motion of this shaft being again transmitted to a horizontal shaft, which may receive the power of several sets of these wheels.

CABLE-RELEASING DEVICE AND CROSSING.—A. Jeffreys, S. F. No. 500,903. Dated July 4, 1893. The invention relates to a novel device for releasing the grips of cars from the cable at an instant before another line of cable which crosses the first one is reached, and a means for automatically carrying the grip over the crossing cable to prevent contact therewith. In the construction of cable roads it is often necessary to carry one road transversely across another. In such cases one of the ropes must pass beneath the other one, and it will be manifest that the grips of all cars which are driven by this lowermost cable must be released just before the uppermost rope or cable is reached, in order to prevent the grip from being forced against the other rope and injury done. This invention is designed to provide a device for automatically releasing the grips without the necessity of any attention from the gripman, and the lifting of the grip when so released and transferring it over the other cable.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is thoroughly illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. This a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, cash, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

MINING AND SCIENTIFIC PRESS.

The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts Illustrated or described. A Standard-Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

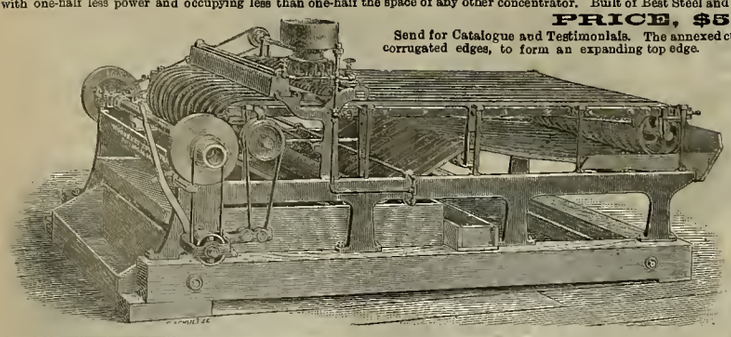
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, $575, f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.



THE SAN JACINTO ESTATE—Office of the General Manager. CAJALCO, Oct. 30, 1891.

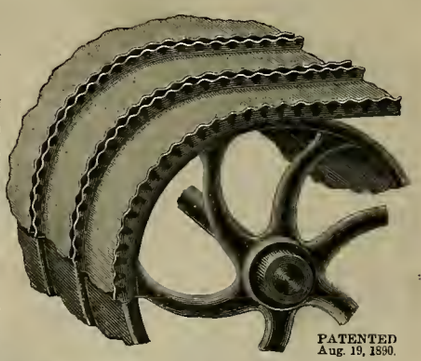
GEO. E. WOODBURY, ESQ.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines at work here

[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O address, South Riverside, San Bernardino County.

CAJALCO, February 17, 1892.

GEO. E. WOODBURY: Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully S. HARRIS.



PATENTED Aug. 19, 1890.

GEO. E. WOODBURY, Man'f'r, 213 to 219 First St., San Francisco.

FRANCIS SMITH & CO.,

MANUFACTURERS OF

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes

NO. 180 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill supplied.

A High-Speed Electric Locomotive.

The first electric locomotive of any considerable size in the United States, and the first practically operative high-speed electric locomotive in the world adapted to the steam railroad, has recently been completed at the Lynn works of the General Electric Company, and will shortly be exhibited at the World's Fair. Its completion marks a distinct advance in electrical development.

It is a 30-ton locomotive, designed for a normal speed of 30 miles an hour, primarily intended for operation on elevated railways, and for passenger and light freight traffic on less important steam roads. It is of compact construction, solidly and substantially built, and runs on four 44-inch wheels. Its dimensions are: 16 feet 6 inches long, 11 feet 6 inches high, 8 feet 4 inches broad, having its draw-bars 2 feet 6 inches from top of rail—the Manhattan elevated railroad standard height. The draw-bar pull is calculated at 12,000 pounds.

GENERAL ELECTRIC COMPANY'S HIGH-SPEED ELECTRIC LOCOMOTIVE HAULING TRAIN.

The propelling power is furnished by two electric motors of especial design and construction, each axle being provided with one motor. The motors are gearless, and are supported on spiral springs resting on the side frames of the locomotive truck. This method of suspension leaves the wheels free to adjust themselves to the irregularities of the road-bed, and consequently the wear to both tracks and motors is diminished.

The motor fields consist of massive iron castings, to which the hollow field spools are bolted. The armatures are of the iron-clad type, having each separate winding embedded in a mica-lined slot cut into the curved surface of the laminated iron armature body. The axles of the locomotive pass through the hollow shafts on which the armatures are mounted. These shafts rest in bearings of the motor frame, and are connected to the axles by universal couplings, which allow of freedom of motion in all directions. The commutators are of massive construction, and there are four sets of brushes to each commutator.

The motors are controlled by means of a series parallel controller set up in the interior of the cab. This device embodies all the latest improvements made in this type of apparatus by the General Electric Company. Under test it is found that the series parallel controller allows of a more gradual and easier starting of the electric motor, and the speed can be more delicately and instantaneously controlled than in the case of the steam locomotive.

The truck, suspended from the journal boxes, is constructed of heavy I beams, and forms the foundation for the locomotive cab, of sheet iron, of symmetrical design, and so curved off as to diminish the atmospheric resistance as far as possible. The interior is finished in hard wood. Two sliding doors are placed at each side of the cab, and the windows are so arranged as to permit of an unobstructed view in all directions. There is ample space in the cab for the motorman's movements, and it affords him considerably better protection than that usually vouchsafed the steam locomotive engineer. The air for the brake is supplied by a special electrical air compressor, which also operates the whistles. This air pump has an oscillating cylinder of 6 inches diameter with a 6-inch stroke, supplying 6000 cubic inches of air per minute at 70 pounds pressure. The normal speed of the armature shaft is 675 revolutions, and of the crank shaft of the pump 110 revolutions. The dimensions of the air compressor are, length 41 inches, width 16½ inches, height 25 inches. The pump motor is controlled by a special rheostat. This, by an intermediary device, is automatically regulated by the air pressure.

This locomotive has been designed for a normal speed exceeding 30 miles per hour. The use of these locomotives over very long distances is at present limited only by the cost of long lines of electric feeders, and until the problem offered by this condition is solved, restriction of its employment must necessarily exist. But for places comparatively near each other and where traffic is dense—the more dense the better—the electric locomotive is peculiarly adapted, for here all the advantages of electric propulsion are available, unhampered by the extreme expense involved in long feeder lines.

The evolution of the use of the electric locomotive will probably follow along the lines dictated by expediency and favoring conditions. At first they will probably be used in elevated railroad service, and in New York, Brooklyn and Chicago alone their advent will be hailed with a feeling of deep gratitude. They will then probably be adopted as feeders to the trunk lines, both for freight and passenger traffic, and to operate short suburban lines, where a rapid, efficient service is requisite. Their peculiar fitness for switching purposes will advance their use another step, and then, slowly as the different problems presented are overcome, they will invade the province of the trunk-line steam locomotive.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 79.

Comment.

At a meeting the other day of the Executive Committee of the State Anti-Debris Association, Manager Phipps submitted his report, in which he said:

"The work of the watchmen reveals the fact that there is some hydraulic mining on the North Ynha river in Sierra county, in violation of law, operated by prominent members of the Miners' Association. In order to ascertain the ownership of these mines, the manager, W. T. Phipps, accompanied by his wife, went to the Recorder's office at Downieville on the 11th inst., and on requesting to be shown the connty records, and without introducing himself, was by the Recorder, Mr. Moore, refused the privilege of either examining or being assisted in examining the records. The fact that the Recorder several times called his name convinced Mr. Phipps that his business was suspected, and that the Recorder's object, as he virtnally admitted, was to prevent the desired information heing obtained."

It does not seem to us nece:sary for Mr. Phipps or any other anti-debris man to misrepresent facts simply to make a point against the Miners' Association. He first says the law is being violated by prominent memhers of the Miners' Association, and then says he was unahle to ascertain the ownership of these same mines, because the Recorder refused to let him see the records. If he tried to find out from the Recorder, and could not find out, the names of the owners of these mines, how could he know they were "prominent members of the Miners' Association?" The two stories in the eame report do not fit well together. We do not uphold any miner who hreaks the law or any Recorder who refuses permission to any citizen to examine public records; hut hecause some men may be mining contrary to law, it does not follow that they are prominent members of the Miners' Association. That association has officially and privately condemned those miners who persist in illegal mining, a fact which Mr. Phipps very well knows. If people who happen to be members of the association violate the laws, they do it against the remonstrance of that association and not hy its sanction, permission or aid, and are worse enemies to the miners' cause than the professional anti-dehris agitators themselves. But in this instance there is no proof to hack up Mr. Phipps' statement that these men in Sierra county are even members of the Miners' Association, much less prominent ones. He himself confesses he was unable to ascertain the ownership of the mines, and in so doing confesses to an unwarranted misrepresentation hy making the other statement.

In some of the silver-mining districts the men are serenely accepting a reduction of wages rather than to he thrown out of employment altogether. In other places they refuse to do this and quit. At Leadville, Colo., as noticed in our Mining Summary, the Miners' Union refused to accept $2,50 per day temporarily and some of the hig mines quit working. On the Comstock, Nevada, a reduction of 25 per cent is expected. At Park City, Utah, a reduced scale of wages has heen accepted and work will go on. While so many thousand men are out of employment in the silver camps it would seem policy on the part of the miners to accept a temporary reduction rather than be out of work for a long time. Under present conditions, unless silver mines can reduce expenses to the lowest possihle point, they cannot be operated.

Within the last 30 days nearly $1,600,000 in fine gold from the mines of this State has been deposited in the U. S. branch mint in this city. California gold mines are now producing considerably over one million a month, with promise of a decided increase dnring the rest of the year. The gold product of the State last year was $12,500,000, but since the cessation of silver mining elsewhere an impetus has been given to gold mining here which will, soon begin to bear fruit. California has hy far the largest and most productive gold-mining region in the United States. It has suffered to some extent for lack of capital for development of prospects and small claims, but it is expected that this will now he remedied. Good "running" gold mines are scarce and in demand. They are hard to find for purchase, as those who own them hold on to them. The smaller claims and prospects are what will have to he taken hold of by people in search of gold properties. There is some risk in this sort of investment, of course, since no man can tell what a prospect will amount to. Only development will prove what such properties are, and this takes money.

The spectacle of the enterprising and rich city of Denver, Colorado, opening soup houses where two or three thousand people a day are fed is a remarkable one. Only a few months ago that city was held up as the model of Western towns in its activity, push and large husiness. How much of the present depression is due to the actual closing down of Colorado mines and smelters, and how much due to the "scare" brought about by predictions of disaster in case of failure of free coinage, no man can say. Denver itself has no mines in its limits or boundaries, though a center for surrounding camps more or less distant. Its smelters and railroad facilities have made it a mining center, and it is naturally affected by the closing down of the mines. Those out of employment gravitate to the city, which is therefore now filled with idle men. It is a difficult problem to know how to care for these people, and it is just now rendered still more difficult by the failure of hanks and general commercial depression, by which those who would otherwise assist are unable to do so. Working people who can leave there are doing so, but many cannot from lack of means. The city is seeing harder times than could ever have been anticipated.

The rich strike in the famous old Virtue gold mine in Oregon will be a disagreeahle surprise to the Salt Lake men who only a few weeks ago forfeited $5000 for the privilege of giving up a bond they had on the property. Mr. Grayson, the owner, has spent a great deal of money on the mine, and has been trying to sell it for a long time. It is prohable that he is now glad he did not make the sale, as very rich ore has been found in the bottom of the shaft, and there are indications of an old-time output. In a gold mine of this kind there are many possibilities, and while the working has been unprofitahle for some years, the expenditures are now apt to he returned with good interest.

The appointment of ex-Governor George C. Perkins as U. S. Senator, to fill the unexpired term of the late Leland Stanford, is pleasing to the mining community of this State, as Senator Perkins has heen a miner himself, has lived among them, and will be in sympathy with anything which will aid and foster the mining industry of California. This State will now have a Senator who has a practical understanding of mining matters.

Col. Geo. H. Mendell, Lieut. Col. W. H. Benyuard and Mayor W. H. Heuer, composing the California Debris Commission appointed under the provisions of the Caminetti law, returned on Monday from a short trip to the hydraulic mining regions of Placer, Nevada and Yuba counties. The object of the trip was to see what opportunities there are for the construction of impounding works. The members of the Commission also wanted to converse with the hydraulic miners and find out what difficulties prevented their applying for licenses to mine. It was the original intention to extend the trip to Plumas county, hnt this was given up and they may go there later on. The Commissioners met a numher of miners and were shown the sites of several proposed dams. They also examined a nnmher of dehris dams already built and were shown several places where there are successful impounding works. The visit of the Commissioners to the mining regions will inspire confidence among the miners and lead to their presenting their petitions for license to mine. Several of the large companies are now preparing to do this.

South African Gold Mining.

The Witwatersrand district, South Africa, continues to show a monthly increase of gold production, and, as more mills are about to he erected—some of them very large ones—the produciion is apt to show a still further increase. The gold retnrns from the camp for the month of May were as follows:

	Ozs.	Dwts.	Value.
From Mill	85,750	14	£310,305
" Concentrates	5,536	16	21,787
" Tailings	21,278	9	64,655
" Alluvial	171	10	520
" Other Sources	4,174	6	14,610
Totals	116,911	15	£411,877

The value of the mill gold is about £3 10s. per ounce, and the cyanide gold £3 per ounce.

This district uses the cyanide process more extensively than any other one in the world. In fact, until this process was introduced, the region did not attract such attention as it does now, nor was its product anywhere near as extensive. Much of the gold now being produced comes from old tailings which had accumulated as the result of former work. These tailings are all being worked by the cyanide process.

The African Gold Recovery Co., Limited, which controls the operation of this process in the camp, keeps a record of the gold produced hy the use of the cyanide. For the month of May, out of the 116,911 ounces of gold produced, 24,004 ounces came from plante operated with this system. This shows an increase from April of nearly 4000 ounces, due to the use of the cyanide process. The record is as follows:

AFRICAN GOLD RECOVERY CO., LIMITED.
May Production.

	Ozs.	Dwts.
Caledonia Works	67	7
Crown Reef G. M. Co., Ld.	1,922	0
New Rntfonteni Co., Ld.	985	19
Nigel G. M. Co., Ld., (Concentrates)	508	10
" " " (Tailings)	1,403	5
Meyer & Charlton G. M. Co., Ld.	422	1
Salisbury G. M. Co., Ld.	315	0
Robinson G. M. Co., Ld.	1,038	18
Ferreira G. M. Co., Ld.	215	4
Black Reef Syndicate	210	1
Langlaagte Estate & G. M. Co., Ld., (Tailings)	2,328	0
" " " (Concentrates)	420	0
New Primrose G. M. Co., Ld.	2,433	18
Orion Syndicate	1,104	9
Chemis Syndicate	510	14
Village Main Reef Co., Ld.	125	4
Randfontenl Estate Gold Mines, Ld.	605	18
Treasury Tailings Syndicate	419	8
La Fortuna Syndicate (Stanhope Tailings)	458	14
Durban Roodepoort G. M. Co., Ld.	2,509	0
Jubilee Gold Co., Ld.	358	14
Walker Long (Evelyn Tailings)	215	5
Rand Central Ore Reduction Co., Ld.	1,334	7
Henry Nourse G. M. Co., Ld.	525	13
City and Suburban G. M. Co., Ld.	400	7
New Heriot G. M. Co., Ld.	1,051	19
Tribute G. M. Co., Ld.	812	4
Stanhope G. M. Co., Ld.	245	9
Ravenscraig Syndicate	314	10
Totals	24,004	4

With such an experience as this to cite, it is useless for people in other gold-producing regions to say "there is nothing in the cyanide process." There may be nothing in it if not worked properly, but when systematically operated on a large scale, as in South Africa, the results show it to he a most valuable metallurgical process.

Gold Properties on Stock Boards.

At a meeting of the executive committee of the San Francisco Stock Exchange on Wednesday, a resolution was adopted suspending for 30 days the rule requiring the payment of $500 for the privilege of listing gold mines on the Exchange. They will only be called upon to pay the $100 annual dues. It was also resolved to have a circular printed giving all information upon this subject and to send a copy to every gold-mining company and gold-mine owner upon the Pacific Coast. As we recently stated in an article on the subject of mining stocks, there are no gold mines listed on the Stock Boards except a few of the Bodies. The transactions are almost entirely in silver mining stocks. There is little or no business in them in these days, and the brokers have heen having even harder times than the rest of the community. This new plan is intended to bring in a new line of stocks to he dealt in. Gold mines are in demand just now and perhaps would make good lines of speculation. The Pacific Stock Exchange a year ago offered extra indncements for gold properties to he listed, bnt very few have taken advantage of the offer. It remains to he seen how that of the San Francisco Board will result. There has always heen less chance for speculation in gold mines than in silver. Notwithstanding our many mining-stock excitements, the owners of gold properties have held aloof and have not listed their mines. Whether they will do so now is a question. The stocks of more or less gold-mining companies change hands at private sale, but usually in "blocks." They are not quoted on the markets, and only those directly interested know much of their value. Gold-mining here is generally carried on as a legitimate business operation, and the speculative feature was years ago eliminated. It may he just at this time, and under the peculiar circumstances existing, gold-mining companies will list their stocks and permit them to he speculated in. We do not anticipate,

however, any great rush to accept the offer of the Stock Exchange, on the pert of these companies. Most of the gold mines ere conducted as private business operations, and the ways of Pine street have not generally been of much benefit to such mines as heve been dealt in, whetever has been the result to the "operators" and managers.

Auriferous Gravel Channels.

In his article on the "Ancient River Beds of the Forest Hill Divide," Mr. Ross E. Browne gives the courses and gredes of various patches of channel exposed in mining, but seys that the information in rather meeger. As to the origin of the quartz gravel, be says: The enormous accumulation of quertz gravel in the white channel of the Mountain Gate and Hidden Treasure mines is a matter of some interest. A lerge number of the smoothly washed bowlders are from three to six feet in diameter, and weigh from one to ten tons eech. One of the lergest encountered had a smoothly washed surfece and was between ten and twelve feet in diameter, weighing over fifty tons. It does not eppeer likely thet the heavier of these moved very far after reaching the rough bottom of the river bed, and the surfaces were probably polished by the sherp quertz sand in the swift current. Still the great mass of the meterial was doubtless derived from a source far above these sections.

In extracting the gravel and exposing the channel bottom there have been fonnd a number of large quartz ledges. One of these measured thirty-four feet in width. Still the amount of quartz thus seen in the bedrock does not appear as sufficient to account for the filling of the channel. One is led to assume that the size of the quartz ledges, or their number, farther up stream and perhaps nearer to the original surface, was greater than in the bedrock now exposed in the channel bottom.

Bench Gravel.—Numerous benches on the rims of the larger channels have been worked with profit. Owing, however, to the uncertainty regarding the extent of such benches when buried under the volcanic cap, there has been very little prospecting for them in the principal drift mines.

High up on the west rim of the piesent El Dorado canyon ere a number of benches which have been hydraulicked with profit. The Batchelder, Franklin, Drummond, and El Dorado Hill deposits are doubtless more recent than the ancient channels under the volcanic cap. The gravel of the Gas Hill and Big Gun pits is practically the same as that of the Mountain Gate and Hidden Treasure white channel—there is good reason for thinking that these are remaining patches of the same channel deposit.

In this connection attention is called to the "Review and General Discussion" of Mr. W. A. Goodyear, pp. 488 to 526 of Whitney's "Auriferous Gravels." Mr. Goodyear's foresight in outlining the courses of certain channels, at that time (1871) but imperfectly developed, is noteworthy. He indicated approximately the course of the Mountain Gate white channel several years before the discovery of the Hidden Treasure, and pointed out the probability of the bend in the Paragon channel many years before the Mayflower discovery was made.

Depth of Gravel.—The depth of bedrock gravel wholly under the volcanic cap is, as a rule, from thirty to one hundred and seventy-five feet in the channels of the first period, and from a few inches to twelve or fifteen feet in the channels of the second period.

Width of Channels.—The character of the bedrock seems to have had an important influence on the width of the channel, the course and the psy. The old river was frequently narrowed down and turned by contact with belts of the harder metamorphic rocks. The accompanying plan of the Red Point mine is a good illustration of the effect of the hardness of the bedrock upon the width of the channel and the amount of gravel deposited. The black surface represents the amount of gravel extracted, and practically the entire extent of gravel in the channel hottom. Where the channel crossed the hard reef, it was narrow and contained no gravel, the volcanic cement resting immediately on the bedrock. (See page 65.)

The Gold.—In the Blue Point the greater part of the gold is of medium size or fine and flet or scaly. The gold from the blue channel of the Mountain Gate mine and from the Paragon and Mayflower channel is about the same as that from the Red Point. That from the white channel of the Mountain Gate and Hidden Treasure and from the Weske is somewhat coarser. Nuggets weighing one to two ounces are not uncommon; they seldom weigh as much as 10 or 15 ounces. The distribution of the gold in the gravel is not always the same, though, as a rule, the bottom layer of gravel is the richeet.

The fact is frequently commented upon that the quartz ledges in this district, though numerous, are usually too poor to pay the expense of working. This does not necesearily justify the conclusion that they were too poor to furnish the gold in the chennels. Some of the ledges have ehown gold enough to induce the investment of capital, and have at times paid a profit. It would not appear as over-sanguine to expect $2 or $3 per ton in a bottom layer of concentrates, representing a very smell frection of the mass of quartz broken and grounil slniced.

Finely lamineted slates with quartz seams form good riffles in the channel bottom for the lodgment of the gold. The gold nuggets and scales frequently become embedded in the softer slates to such an extent that it pays to remove the bedrock to a depth of several inches, or even a foot.

The effect of the swiftness of the current upon the pey is important. An underloaded current, *i. e.*, a current charged with less detritus than it is well able to carry, is ept to cut its bed and prevent the accumulation of gravel. A greetly overloaded current will deposit too rapidly to admit of the concentration of the gold dust. It is apperent, therefore, that a suitable relation between the velocity of the current and the amount of material carried is an importent fector in forming a streak of pey gravel. If such a relation exists, and is undisturbed for a considerable period of time, and the material passing over the riffled bed cerried sufficient gold, a rich body of pay gravel may be formed.

An increase of grade, or nerrowing of the channel, will cause an increase of velocity, and the same stream may be nnderloaded in a narrow, steep section, and overloaded in a broad, flat eection. Furthermore, a stream may be underloaded in the center of the channel and overloaded on the rims; or it may be underloaded on the outer rim of a curve and overloaded on the inner rim.

Other conditions being the same, when the average grade of the channel is very great, one should expect to find the pay in the broad, flat sections, on the rims, and high up on the inner rim of the bend; when the average grade is very small, rich gravel will be more likely to occur in the sections where the current is relatively swift.

In the Forest Hill district, where the average grades range from 60 to 80 feet to the mile, the general experience in working the bottom leads seems to be about as follows:

In the larger channels of the first period, the best pay pay is found on the brow of the steeper pitches on the down-stream course and on the inner rims of a bend. The pay generally favors one rim for long stretches. Near and at the foot of steep pitches and in very narrow sections there occur potholes and the deposit is barren, consisting of round bowlders and sand. In the channels of the second period there is a scarcity of gravel in the narrower sections, hence the broad, flat sections are preferred, even though the gravel may not be so rich.

The upper pay leads, such as the upper lead of the Paragon, probably represent long periods of comparative equilibrium between cutting and filling, while the poor strata are more likely to represent periods of rapid filling. A lack of stability in the beds of the upper strata militates against the frequent occurrence of rich pay leads in them.

Fig. 13 presents the average cross-section of the Mayflower channel, the plan and longitudinel section, or profile, of the bodies of pay gravel extracted (in hlack), and the plain or rim contours ten feet above the channel bottom. There are further given, in small figures, the total amount of gold extracted from the various sections and the average yield in dollars per ton of gravel (ranging from $3 to $5) at intervals of 100 feet. The average grade of the Mayflower channel is 12 feet in 1000.

THE successor to Geo. W. Starr, who resigned the superintency of the original Empire Mining Oo. of Grass Valley to go to South Africa, is Mr. Robert Walker, who has been assistant superintendent and book-keeper of the Empire mine for the pest five years and a half. He thoroughly understands the workings of the mine, is a good maneger, and will give satisfaction to the company. Chas. Stocks, the foreman selected, is one of the best-known mining men in Grass Valley district. He is familiar with the underground workings of the mine, and will continue to make the Empire yield handsomely.

D. N. OOFFIN has resigned from the superintendency of the W. Y. O. D. mine of Grass Valley to give all his time to the development of the Green Mountain mine, in which he is a large stockholder. W. H. Shockley has besn appointed his successor by the W. Y. O. D. people. For 12½ years Mr. Shockley was superintendent of the Mount Diablo mine at Oandelaria, Nev., which is now closed down owing to the decline in silver.

THE Excelsior mine at Smartsville is getting ready to build new reservoirs, etc., to prepare for hydraulicking. They will shortly present a petition to the California Debris Commission for a licenee to mine.

Coast Indnstrial Notes.

THE railroad company is rapidly collecting the timbers for the great bridge that is to be built between Secramento and Washington.

NEW rich placer mines have been discovered on one of the tributery streams on the Yukon river, a few hundred miles below Forty-mile Creek.

THE Pacific Underground Electric Railway Company was incorporated Tuesday. Directors—J. J. Scrivener, F. S. Ohedbourne, John F. Burgin, A. Oraig end D. B. Richerds. Capital stock $100,000.

ARTICLES OF INCORPORATION have been filed on behalf of the Shasta Canal and Irrigation Company; capital $100,000. Directors—Oharles Rickoff, A. A. Hebbard, William Crum, B. A. Cutter and S. G. Pettis.

THE Sierra Grevel Mining Company was incorporeted Monday. Directors—C. H. Whitten, W. H. Beetty Jr., Joel Mason, Jemes E. Berry and Albert Hoogs. Capitel stock $125,000, of which $5100 has been subscribed.

THE Plecerville Water Works Compeny has incorporated with a fully subscribed capital stock of $120,000. The directors for the first yeer are: Eliza Baum, Rudolph Beum, Alexander Baum, John Peat and Gustav Dresel.

NAVAL CONSTRUCTOR TAYLOR, at Mare Islend Navy Yard, has completed plans and specifications for a new tugboat for the nevy yard. The plens and specificetions will be forwarded to the Navy Department at Washington for approval.

THE record of the Columbia river salmon fisheries up to date has never shown such a disastrous year as the present, and the fishermen are unanimous in declaring that the trap contrivances are responsible for the shortege. Up to last Saturday the total catch for the whole river hes been 185,610 cases, not half of last year's pack.

THE Western Manufacturing Company, 114 Mission street, has shipped to the North Star mill a monster steam road-wagon for hauling lumber. It is similar to the one made by this firm for Richardson brothers, of Truckee, which has been in use for three years, hauling 50,000 feet of lumber to the load and saving $1.50 per thousend.

THE closing down of the silver mines, smelters, redncetion works, coal mines, railways and factories has put the laboring classes of Oolorado in a deplorable condition. It is estimated that 10,000 men are idle in Denver and 20,000 in outside towns. Soup-houses are being established for hungry people, and other means taken to help the needy.

THE San Antonio Water Company has decided to issue bonds for $350,000 for the improvement of the irrigation system of Ontario and to purchase additional water. The vote stood: For bonds, 4606 shares; against, 97 shares. The purpose is to increase the water supply to an inch to five acres. Several propositions have been made to the directors of the company to take the bonds for water.

THE Superior Court has dissolved the injunction forbidding the Bear Valley Irrigation Company from extending the canal across the land claimed by Alice Marlette. Both sides had men with shotguns on the ground for some weeks to guard their interests. The new canal extends from the Santa Ana river to Alessandro, 20 miles, costing $250,000. The decision is a victory for the company and very important to the region about Redlands, Sen Bernardino connty.

J. W. KIMBLE, one of the proprietors of the great tinplate manufacturing plant of W. & G. Taylor Co., Philadelphia, was in this city this week. He said: "We have used at times considerable of your San Bernardino tin, but we found that it, as well as other American tin, cost us three cents a pound more than imported. We couldn't stand that very well, so most of the block tin now used comes from abroad, some from Australia. All our machinery, however, and everything else we use, directly or indirectly, is of American manufacture."

AT Ohino last year, which was the third year since the beet-sugar business was entered upon, there was produced more sugar than on the largest plantation in the South. The product consisted of 8,000,000 pounds. There are now about 6000 acres of beets growing there, and four years ago the land now devoted to beets consisted of part of an open ranch, for which there was no special use. Three years ego, too, when the factory began operations, there was very few people there. Now there are about 1500. This shows how rapidly a beet factory will gather workers around it.

A LONG-PENDING DEAL between the Jamul and Mount Tecarte Water Companies, San Diego county, was concluded last week. The Mount Tecarte Company gives the Jamul irrigation district water in exchange for reservoir sites. This means the almost immediate construction of one of the greatest irrigation systems in the State. The two reservoirs have a capacity of 25,000,000,000 gallons. Over one hundred thousand acres are to be irrigated. Mr. Pope of San Francisco, one of the interested parties, says the work will begin inside of 90 days, and, as preliminary, a line of railroad will be built to Dulzura, 40 miles east.

ARTICLES OF INCORPORATION of the Southern California Development Oompany were filed with the County Clerk of San Bernardino county last week. The directors are A. P. Willoughby of New York, B. O. Johnson, R. E. Archer and C. E. Fish of Redlands, and B. W. Brown of Moreno. The principal place of business will be at San Bernardino. The capital stock is $15,000,000. The objects of the corporation are to acquire water and water rights, develop and sell power for manufacturing purposes and carry on an agricultural and manufacturing business.

THE sealing vessels from San Francisco, Victoria and other Pacific ports have had a lucky season thus far. From traders on the Aleutian islands and along the coast on the way up, Commander Ludlow and his assistants learned that nearly 80,000 skins had already been secured by the hundred-odd sailing craft engaged in this work during the present year. The skippers, however, claim

to have taken nearly 60,000 of these in Japanese waters, while another 6000 recently consigned to British Columbia, it is alleged, were captured on the Russian coast, and leaving 12,000 for the Alaskan coast and Behring sea, it is largest catch at this early period reported for several years. How many of these skins were taken in Behring aea can only be estimated. The 6000 skins delivered in British Columbia sold at $14 per skin, an unusually high price.

THE financial stringency throughout the country is affecting the manufacturing industries of Napa. Owiog to the lack of demand for its product the Manufacturers' Woolen Mill has heen compelled to reduce its force, and as soon as the present stock of raw material is worked up, which will he about the 1st of next month, the mill will shut down entirely until the times improve, thus throwing out of employment about 50 persons. At the Sawyer Tanning Company's works the force in the finishing department is heing reduced. Other departments of the tannery are not affected, and there will he no reduction of the working force, except in the department named. McBain's tannery is still running with the usual force, hut it is intended to shut down as soon as the present stock on hand is worked off, which will he in about two weeks. There are rumors that the Corlett planing mill will he temporarily closed and that the Main tannery may shut down until hetter times come. If so, 400 persons, many of them heads of families, will he thrown out of employment.

FOR the construction of a jetty at the entrance of San Diego hay, hids have heen put in at the office of the Government engineers in this city. The bids include trestle per lineal foot, mattress in place per cuhic yard, stone per 2240 pouods, and office huilding. The hids suhmitted for the aggregate of these items are as follows: S. R. Smith, $31.82; W. Jacohson, $36 81; Healy & Tibbitts, $41.70; H. G. Easton, $43.61; J. G. Quinlan, $43.91; A A. Polhemus, $49.10; D. Landen, $51.72; J. P. Phillips, $58.50. The length of the jetty has not been decided upon, as the appropriation on hand only amounts to $85,000, and about $10,000 of this sum will he consumed in defraying the expenses of the Government's representatives who will he in charge of the work. In width, however, the jetty will measure 32 feet over all, and a double-track, standard-gauge railroad will be constructed on the trestle work. The crest of the jetty will he at the level of the mid-tide, with sides sloping in such manner as hest to resist the action of the waves. On the line of the jetty the low water depths vary from 1 to 11 feet, the average being from 3 to 5 feet. The maximum depth of over 15 feet is found in certain places. The jetty will revet the shore line at the extremity of Coronado North island, and, when finished, will act as a breakwater to the eutrance to the hay where steamers have at present to take such a devious course in order to avoid shoals. The rock to he used in the work cannot be procured from any point nearer than the Sweetwater quarry, which is 24 miles distant, or from Waterman's quarry on the Cuyamaca road, nearly 26 miles distant. The hrush, too, will be hrought as great a distance, while most of the lumher will he carried down from San Francisco. Work will commence within 30 days from the date of the contract heing awarded, and must, under the terms of the contract, he completed within nine months.

Trip of University Students to the Mines.

TO THE EDITOR :—I wish to publicly express through you my thanks to some of the mining men of Amador and Calaveras counties for the many courtesies extended to my students and myself in a trip which has just heen concluded through these counties. The Amador County Miners' Association kindly volunteered to meet all the expenses of the party while in their county. This hospitahle treatment was very much appreciated, although the hoys preferred to pay their own way. We are under very great ohligations for kind offices to almost every one we met, hut I must mention in particular Mr. A. B. Call of the Gover, Mr. Hale of the Keystone, Mr. Myer of the Bunker Hill, Senator Voorhies and Mr. Downs of Sutter Creek, Mr. J. F. Parks of the Kennedy, Mr. Detert of the Zeila, Col. Alvinza Hayward and Mr. Charles Lane and his son of the Utica, and Mr. Frates of Ione City. To all of these and many others I am much indehted for what has proved a very interesting and profitahle trip to hoth students and myself.

Your readers will he interested to know that Col. Hayward is going to give the "cyanide process" a trial on a workiog scale on some of the extremely fioe sulphurets that result from the "hlanket plant." These are so fine that it is difficult to roast them without mechanical loss. Vacuum filtration after treatment in an agitator will he used. The results will be watched with great interest.

I agree with you as to the necessity of calling attention to the value of gold-mining to California. I was reading an old copy of J. Ross Browne's Resources West of the Rocky Mountains for 1868, when I came across the following, p. 65: "*Utica.*—The Utica, 600 feet long, is owned in San Francisco. There was a nine-stamp mill which did not pay, and has been moved away. The deepest workiogs are 60 feet from the surface."

This was the condition of affairs when Charlie Lane and Col. Hayward took hold of it. Every one knows the result. Is it not a pity that there are not more capitalists who are willing to risk a little in developing the resources of the State?. Very sincerely yours,

Berkeley, July 22, 1893. SAMUEL B. CHRISTY.

San Bernardino County Camps.

TO THE EDITOR :—At Vanderbilt the sale of the Gnld Bronze mine to J. B. Haggin has heen effected and possession given. J. L. Flood visited his St. George property this week. President Lyle is now huying pumping machinery with which to drain the mine and permit sinking. The Hongkong mine, the property of A. A. Banning, is showing some fine ore. J. L. Rohinson, one of the owners of the Richmond, left for Chicago Monday. W. H. Smith is making a shipment from the Murray. John Kreiner brought in some rich ore from Soda lake. Its value is about equally divided between silver and gold. Several prospecting parties have gone to a district five miles south of Crescent, found hy Metcalfe and Dooley. It promises well, large veins hearing gold in a free state showing prominently. A fine gold strike was recently made oo the north side of Campbell mountain. The Nevada Southern railroad is laying track and will be within two miles of Vanderbilt by August 10th.

In the Crescent district, W. A. Phelps is stoping a carload of $200 gold ore for shipment. A contract has been let to sink the Spaulding silver mine 50 feet deeper. The three-foot ore hody now showing averages 150 ounces. Work will start this week on the properties recently bought by Los Angeles parties and under the management of Al Stevens. Harvey Forester has made a free gold discovery on the north side of the mountains that excels anything yet found in the district. A concentrator will be needed very shortly, and water is being developed for that purpose. A peculiarity of this district is the rich silver float found in several places, while the ledges which furnished it have never been discovered. Not much attention is being paid to silver properties, the miners devoting their time to seeking the gold ledges which show over so extended a section. M.

Vanderhilt, July 22, 1893.

Pocket Mining.

NUMBER IV.

Free or Decomposed Pockets.

TO THE EDITOR :—The ore found in free or decomposed pockets is of a magnetic nature, or, in other words, each separate particle of the gold has a slight affinity for the other. In order to prove this, it is only necessary to take the flour gold from one of these pockets and corner it dowu in a pan until it forms a string of an inch or so in length in the crease of the pan; then take considerahle more water into the pan and by a sudden jerk movement try to scatter the flour gold hy the action of the water carrying it over the hottom of the pan. No matter how fine your gold may be, you will find, try whatever way you may, that you cannot completely distribute and separate the particles of gold. You can always see it with the naked eye, and, if you will take a small magnifying glass and examine the bottom of the pan, you will find that the particles of gold lie in hunches or clusters and not completely scattered, each particle laying separate hy itself.

The flour gold from a milling vein, or, in other words, from a vein or ledge that carries an equal amount of gold all along, when treated in this manoer will completely separate, and it will he found hy examining the hottom of the pan closely with the glass that each particle will he seen lying hy itself and not gathered in clusters or hunches the same as the pocket gold. This proves that the particles of this class of pocket gold have an affinity or attraction for each other which causes them to hunch together. All of the minerals found in the pocket in a metallic or solid form have the same attraction or affinity which the gold has, and all of them play an active part in concentrating the gold and forming the pocket.

There may he several other minerals found in this class of pockets, hut a pocket without *lime*, *iron*, *copper*, *lead* and *sulphur* has not yet heen found. They are always present in free or decomposed pockets. They may not always occur in the same form, hut they are generally in either a chloride or metallic state. These five minerals are the key to the pocket and are what cause the pocket to form. Of course gold is included and makes the sixth mineral. Should *any one* of these minerals be lacking, besides the gold, in a ledge and the ledge or seam that comes in contact with the ledge proper, there will he no pocket found, or at least there never has been a pocket found without this comhlnation of minerals. Several other minerals may he found in pockets hesides those five above named, hut they do not play an important part in forming the pocket. Wherever this comhination of these five minerals is found in a ledge, and there is any gold, there is generally a pocket on the ledge, although, either from some curious action of nature or from the peculiar action of some other foreign mineral upon this comhination of five, it sometimes occurs that no pocket forms even when those five necessary minerals are present, hut this seldom happens.

Those free or decomposed pockets invariably occur near the surface, for this reason: The necessary minerals required to form the pocket, if not already contained In the ledge, must he carried there or drawn to that point hy those in the ledge, and as most minerals are deposited by solution near or on the surface, consequently they concentrate and "pocket" near the surface.

It is nearly always safe to count on finding a pocket on a ledge near the surface where those five minerals exist at ooe point, no matter in what form they may occur so long as they are there. The size of the pocket can very often be determined by the size of the ledge proper. A large ledge nearly always gives a large pocket, while small ledges and seams do not appear to have the body to support a large deposit of those minerals, consequently the pockets are small. The rim, ledge or seam which comes in contact with the ledge proper, at the point where the pocket occurs, is as essential to forming the pocket as the combination of the fire minerals; and in every pocket yet found, of this class, this contacting seam or ledge has always heen found. It appears to be the feeder through which the minerals are carried to the pockets, although sometimes the pocket occurs on this feeder instead of the ledge. Those cases occur oftener where the ledge is harren quartz than where the ledge is more mineralized. The first step that the prospector should take, who intends to follow this hranch of mining, is to make a study of those five minerals, so that he can readily detect them in any form; and when he has acquired that knowledge he then has the main key tn finding this class of pocket. I have known men whn were so expert at detecting, with their eyes, those minerals and the different indications of a pocket, that, after a close examination of the ground, they would walk directly to the spot and mark the place on top of the ground where the pocket was, and upon digging down, the pockets were found directly underneath the spot they had marked.

ALEX QUARTZ.

Hydraulic Mining.

We clip the following from the Bakersfield *Californian*. It is worth reading, for it shows how a hright editor was converted to the cause of hydraulic mining:

The Colusa *Sun* does not like what the *Californian* said ahout the resumption of hydraulic mining, and sneers at our sources of information, suggesting that our statements were founded on hearsay.

Not so. The editor of the *Californian*, so long as his sole source of information was the press, was as ardent an opponent of hydraulic mining as is the editor of the *Sun*. But there came an opportunity for him to visit the hydraulic mining region, some three or four years ago, and he improved it. He spent months traveling through the mining counties. He saw the principal mines, talked with miners, merchants and farmers—yes, farmers, the very farmers who are supposed to have lost so heavily through the operations of the mines. He visited, too, the valleys nf the Feather, Yuba and Sacramento rivers, where so much damage is said to have been done, and, after all this, he read the reports of the government engineers, appointed to examine into all the details of the question.

When he had done this, he returned to San Francisco a thoroughly converted man, so far as regards his previously formed ideas on hydraulic mining.

The farmers, the merchants—every class of people from nne end of the mining region to the other—were found of one accord in their accounts of the loss caused by the suspension of mining, and in their hopes that it might he resumed. Yea, also, many farmers in the valley were found whn complained that their hest market had heen destroyed hy the destruction of the mining industry.

Further than this, fine farms, alfalfa fields, orchards and vineyards were pointed out, which were growlng upon no other than a foundation of slickens, in places where the dehris had heen impounded, and lands once washed out in mining had heen replaced with detritus from other mines higher up.

What the *Californian* said as to the amount of capital invested in hydraulic mines and rendered of no value through Judge Sawyer's decision, was not founded on "San Francisco newspaper statements" any more than were the figures of the annual production of gold, or the total damage caused hy the hydraulic mines. Those figures are all taken, as the *Sun* well knows but will not acknowledge, from unimpeachable and unprejudiced sources. They are supported hy too much authentic evidence to he denied upon the mere dictum of any San Francisco or even Colusa newspaper.

What we have said, we maintain—that the resumption of hydraulic mining means renewed prosperity for all the towns of the foothill belt, now suffering from dry rot, and not for them alone, hut for the cities and farmers of the valleys, whence was once drawn the hulk of the vast amount of supplies consumed annually in the mines.

London Rules Silver Prices.

The N. Y. *Post's* Washington correspondent says: So much criticism has been passed upon the policy of the Treasury in determining the price which it would pay for silver hullion, and so many questions have been raised as to whether the London market or the New York market should he used as a basis, that it was suggested to-day to Mr. Preston, Acting Director of the Miot, the wisdom of explaining clearly to the public the theory upon which the Treasury was proceeding.

"I claim," said Preston, "that in accordance with the law the price of silver in the London market must necessarily he taken into account. It is the price of silver there that regulates the price of silver the world over. The London rate has regulated it all through this century and regulates it now. The London rates controlled the commercial value of silver even when the mints of the Latin Union were open to the unrestricted coinage of silver at a ratio of 15½ to 1.

"The French colnage ratio had no effect after the closing of the mints of the Latin Union to the unrestricted coinage of silver. Ask the bankers of Paris, Melbourne, Calcutta or Hongkong the price of silver, and before answering he will consult the latest London quotations. The English market being so largely supplied hy the United States, we should naturally expect to find silver cheaper in the United States than in London, and when we do not so fiod it we cannot help inquiring the cause. It is because the Treasury is hound to follow the law. If those charged with making the purchases of silver for the Treasury did not endeavor to ascertain whether the price offered agreed with the market price, and if in that endeavor they did not compare the prices offered with the price in London, the world's silver market, they would be derelict in their duty.

"American holders of silver bullion are well aware of the importance of London silver quotations. I find this passage in the London *Economist* of July 8th: 'It would appear now as if American producers were interested in keeping up the London price of silver, as that practically governs the price at which the United States Treasury must huy its quota of 4 500,000 ounces per month. They have heen manipulating this market, which, as it holds no large stock of metal, is comparatively easily influenced.' Now, if the London market is not to be considered in this matter, as some critics of the Treasury claim, why should any one on our side of the water have felt interested in influencing it?"

The Hillock and Mound Formations of Southern California.

Daniel Cleveland, of San Diego, Cal., writes as follows to *Science:*

Some time ago, in an article upon the nest of the trap-door spider, which appeared in *Science*, I mentioned the low mounds in which these nests in many districts are so often located, as being in themselves an interesting formation. I now propose to offer an explanation of the origin of the formation.

Let me begin by saying that these mounds are not confined to this vicinity, for they extend throughout this State and elsewhere on this coast and in Texas; but they are more numerous and better defined here than elsewhere; they are, in fact, a characteristic of certain large areas in our territory. For this reason, among others, I believe this to be the best field for observing and investigating this remarkable formation.

Lying just back of the commercial portion of the city of San Diego there is a great mesa or table-land, which stretches away for a distance of from eight to ten miles to the valleys at the base of the Coast Range. It possesses a rich brown soil, holding in many places considerable aggregations of loose stones which have drifted down from the neighboring mountains and been ground into pebbles. Here for miles the surface is gently undulating, with low mounds lying as close together and as numerous, considering their size, as the ground will permit. These mounds are from one to three feet in height above their bases, and are from ten to thirty feet in diameter, separated by greatly varying areas which in their depressions in many places contain accumulations of cobble stones. An unscientific person seeing these plains for the first time might imagine that they had once been densely populated by large burrowing animals which had left these hillocks to mark their subterranean dwellings.

Several theories have been advanced to account for this formation. The most probable hypothesis is suggested by the nature of the soil and the peculiar vegetation of these plains. The soil itself is dry and hard for the six or eight months constituting the rainless season. During the time of heavy rains it is soft and mellow. During the time of drought it becomes almost as hard as stone.

Each mound, it is evident enough, marks the former home of a shrub or, as was almost always the case, of a cluster of shrubbery, to whose agency the mound in a large degree owed its existence. Three shrubs—*Rhus laurina*, Nutt.; *Simmondsia California*, Nutt.; and *Isomeris arborea*, Nutt.—are conspicuous among the large vegetation of these plains, and have been very important factors in the formation of these mounds. Of these plants *Rhus laurina* is the largest and much more abundant than the other two. It is an interesting fact that these three shrubs are confined to this section of California, mostly to this county, and that they were all first collected at San Diego about 1840, and were named by the eccentric naturalist Thomas Nuttall. He established the genera *Simmondsia* and *Isomeris*. The habits of these plants peculiarly fit them for their office of mound builders. They grow in small compact groups. Many stems rise from the roots, which are large and spreading. The foliage of *Rhus* and *Simmondsia* especially is dense and falls close to the ground.

Dust blown by the steady trade winds of the dry season is arrested by the shrub and accumulates with the fallen leaves at its base, making a steady accretion of material. In this way a mound gradually rises about the plant, in time covering the lower branches and in the case of the smaller shrubs — *Simmondsia* and *Isomeris* — nearly or quite enveloping the whole plant. This process of mound building can still be seen in isolated hillocks. An examination of the older mounds confirms this theory. In the older portion of the mound the earth is compact and indurated, while the surface soil is light loam mixed with decayed and decaying leaves. The mound is protected from washing by the rains at the summit by the overhanging branches and foliage, and at the base by a compact mass of roots. Outside of the foliage and roots the process of erosion goes on steadily, though slowly, during the rainy season, when this soil is peculiarly susceptible to the action of water, and the hollows between the mounds are then formed.

When in the course of time the plant dies from natural decay, from being smothered by the drift that environs it or from the fires that sometimes sweep over these plains, the mounds, being deprived of protection, are attacked by wind and rain and gradually worn down. The mounds are thus made shallower and broader at the base, until from this steady subsidence they sink down and flatten out almost to the general level of the plain.

The presence of living shrubs upon the most perfect mounds and of masses of roots well preserved or in process of decay in mounds in subsidence, where no large growing vegetation has been seen for many years, and in the oldest and flattest mounds the disappearance of all traces of shrubs and roots, confirm our theory of mound formation and subsidence.

What the shrubs I have named—*Rhus*, *Simmondsia* and *Isomeris*—have effected in co-operation with the wind and rain in the formation of mounds in this section, has been accomplished elsewhere by other shrubs and trees. It is a familiar fact that upon the great prairies of Texas mats of timber are generally found upon the summit of hillocks, very much larger, of course, than the mounds of southern California, as those trees are larger than our shrubs.

HAULING LOGS IN THE REDWOOD REGION OF THE UPPER COAST OF CALIFORNIA.

Value of the Varying Grades of Coal.

Recently a test of two days duration was made at the Richard Borden Mills at Fall River, Mass., to find out if a saving could be effected by changing the kind of coal used under their boilers. A standard grade of coal was used, but the test showed very clearly that all good coals are not equally economical. In this particular case it was found that, pound for pound, one coal would evaporate ten per cent more water than the other. That means one coal gave ten per cent more power, or, to show it more clearly as being a matter of dollars and cents, ten tons of the one coal did the same amount of work as eleven tons of the other. The comment of *Power* is that there is an important point for every manufacturer using steam power, and when two standard grades of coal show as large a difference as this, what would a test show were a poor grade of coal compared with a good coal. The result given above is almost startling when a little figuring is done. Merely assuming that the poorer grade cost $3.00 per ton, the better coal would be cheaper by five cents a ton if offered at $3.25. If one salesman could have offered these two coals to his trade, saying that one coal would cost $3.00 a ton and the other $3.25 a ton, would not 99 out of 100 have taken the coal costing $3.00 a ton? The man buying the coal would have figured on saving just 25 cents a ton on all the coal he would use, while as a matter of fact his coal bills for a year would amount to more than had he taken the coal costing $3.25 a ton. Without carrying this any further, is it not very evident that this matter of saving in the cost of power is worth looking into? There are many different qualities of coal. Every one wants the best, but it is safe to say that all are not getting it. There are cases without number where it would be money in pocket to figure out the coal bills for a period of three to six months, and make a change in the source of coal supply and see how the coal bills for an equal period would compare with the original. The actual amounts spent in such periods are often so large that even a small percentage represents a considerable saving.

In the Redwoods.

Such scenes as that upon this page can now be seen at various points in the great lumbering counties of our upper coast region. It represents the movement of a train of logs from the slopes upon which they grew, either to the sawmills below or to the railways which run to the mills from various points accessible over a working grade. After the trees have been felled and cut into proper lengths, the logs are hauled by oxen to the landings on sides of the railway tracks where they are placed upon cars for transportation to the mills. In some localities where there are no railroads the skids run direct to the mills, but this is impracticable for long distances. At most of the places on the northern coast the mills are at the mouths of the rivers and the logging is carried on some miles back from the coast. The skid roads are then used to haul the logs to the trains. These skid roads are made of small logs or limbs placed a foot or two apart. Along the center of the top a rounding groove is soon worn on which the log lies. This grooved part of the skid is usually greased with some cheap lubricant so that the log will slide easily.

Of course these skid roads are down hill, the trees being cut on the ridges and sides of the canyons and dragged over the skids to the railroad at a low point. All the way from three to a dozen or more logs are hauled in a string, being connected by chains. These skid roads may be seen extending in all directions in the timber which is being worked up. On the steep hillsides they are not used as the logs move too freely and can be hauled down more easily on the bare ground. In some places it is not necessary to use lubricants and in others men go ahead with buckets and dippers wetting the skids. In the picture the train has evidently been stopped at the base of a steep grade for the convenience of the photographer.

THE MAGNETIC POLE.—No one knows, and therefore no one can explain, the precise reason why a magnetized needle does point to that mysterious spot on the coast of Bothia Felix; and, strange as it may seem, there was in 1831 no visible trace of anything by which that spot could be recognized, not even so much as a small hillock in the immediate neighborhood, and the only means of proving that the magnetic hill had been reached was by the total inactivity of the compass at that spot, coupled with the almost vertical position of the dipping needle, says a writer in the *Cornhill Magazine*. On this most interesting point the very words of Sir James Ross himself shall be given: "The amount of dip as indicated by my dipping needle was 89° 59′, being thus within one minute of the vertical; while the proximity at least of this pole, if not its actual existence where we stood, was further confirmed by the action, or rather by the total inaction, of the several horizontal needles then in my possession. These were suspended in the most delicate manner possible, but there was not one which showed the slightest effort to move from the position in which it was placed, a fact which even the most moderately informed of readers must now know to be one which proves the center of attraction lies at a very small horizontal distance, if at any

Preventing Gold Robberies from Mills.

A "retired gold miner" writes to the London *Mining Journal* giving the result of Australian experience on the detection and prevention of one of the evils of the gold-mining industry. The letter will be of interest to gold miners in other regions and is herewith reproduced:

From the accounts to hand it is evident this evil of robbery from gold-mills has attained serious dimensions, and I consider it incumbent on the part of practical men of experience in mill management to volunteer any information they may possess that can be of service to help to checkmate the villainy, not only in common honesty to the shareholders that are being plundered, but in the interest of society generally; hence my letter. If you think the record of my experience may be of some service, I request you will afford it space in your valuable journal.

No one that has not experienced the evil of gold-thieving from reduction mills can have any idea of the pernicious element it is, and the difficulty, once that it has got "well hold," of rooting it out. It permeates every class of society in the district connected with the industry, and managers, amalgamators, assayers, accountants, aye, even bank officials, are "all on the job" to "get a bit" while there is an opportunity. To exterminate the hateful monster requires on the part of the mine proprietors combined stern and drastic measures undertaken under the personal supervision of one or more of their directors, and in many instances necessitating the removal of the whole of the official staff. The disinclination of the Transvaal Volksraad to assist in exterminating the evil by legislation increases the difficulty; in fact, it is equivalent to putting a premium on dishonesty and affording protection to the thieves and receivers of the stolen gold.

In Australia no bank or mint will purchase retorted or bar gold, unless it is satisfactorily declared from whence it was obtained, and in event of a purchase being declined notice is given to the police, with the result that the party will be closely watched. This has given rise to a common saying among millmen that there is only one thing more difficult to do than to steal gold from a mill, and that is to convert it into coin after it is stolen. But it is not so in the Transvaal, consequently mine proprietors must protect their own property, and after 23 years practical experience in mining and milling I contend that it is an impossibility for amalgam (in any quantity) to be stolen from a properly-conducted mill, except through either the negligence, incompetence or collusion of the mine and mill officials. I could enumerate a number of instances of amalgam thieving that have come under my observation, and in all cases resulting from one of the above causes, therefore the remedy is in reorganizing the staff so as to eliminate from it all germs that might possibly produce them.

In 1877 a friend and myself were asked to buy a one-fourth share in a private mine in Australia. There were 40 head stamps, plenty of free-milling quartz to keep them going steadily, yielding from 10 to 12 dwts. per ton, and had paid 20 per cent for the past three or four years to the shareholders, who were perfectly satisfied and contented. My partner and I, both practical gold miners and millmen, went down and examined the mine in such a manner that, to use a homely phrase, we "turned it inside out," and there was not a spot of it we did not prospect with the mortar and pan, a mode of procedure that we could not fail to observe was much resented by the mine manager, and we came to the conclusion there was something wrong somewhere, and after waiting to see the battery cleaned up with a return of 9 dwts. 17 grains per ton for the fortnight's running, which the mill manager observed was the poorest they had had for a long time, we remarked that we did not think it good enough, and there was no mistaking the expression of relief in the countenances of those two men when we made the latter remark and bade them good-bye. The poorest prospect we had got at all was equal to nearly 8 dwts. to the ton, and we had any amount that ranged between 15 and 25 dwts. per ton. We concluded that at the least it ought to mill 16 to 17 dwts. per ton, and it was in consequence of this that we so exhaustively prospected it, and finally came to the conclusion that either the mill mortars were not tight and amalgam was escaping into the foundations or there was systematic thieving going on, and we inclined to the latter. By adroit negotiation we succeeded in buying within a month five-eighths of the whole property, and then we again visited it. The general manager, we were convinced, was as honest as the day, but he had no practical knowledge of milling, and neither had he of prospecting with the pan and mortar. The latter can only be acquired by years of experience, and I would consider a man incompetent to be a mill manager who could not by pan-prospecting with certainty estimate to within 2 or 3 dwts. to the ton what ore would yield through the mill, ranging say from one-half ounce to one and a half ounces per ton.

We first of all dispensed with the services of the general manager, and then issued the following instructions to the mine and mill managers, I remaining at the mine to see them carried out until I substituted a practical local man as agent, who afterwards carried on the work most efficiently:

(*a*) Both of those officials to keep separate books and accounts; in other words, to be distinct departments.

(*b*) The ore formerly was all thrown together and put through the mill; I subdivided it into four classes, A, B, C and D, representing deep levels north and upper levels north, deep levels south and upper levels south, and allotted to each class in heads of stamps at the mill.

(*c*) The mine manager to try three prospects, forenoon and afternoon of each day, from the dumps of each of the four classes, and record in a book to be kept for that purpose the estimated mill yield of each one.

(*d*) The mill manager was required to do the same at the mill and keep his record.

(*e*) There were four underground bosses in each shift, 12 in all, I had a hook fixed at the top of the shaft in which I required each of these men, at the expiry of every shift, to record any change in the faces of the quartz and particularly in regard to quality.

(*f*) Having divided the ore into four classes I instructed the amalgamators, of which there are two in each shift, six in all, that I required the amalgam from each to be kept separate with the object of ascertaining what each part of the mine produced.

(*g*) I procured padlocks for the covering boards of the mercury tables and gave the keys to the amalgamators with instructions that they were not to hand them over to any one except the exchange shift without my written authority, and instructed them that they should clean down the plates every three hours, and after cleaning down the amalgam buckets to be placed in the cleaning-room, which I instructed to be kept locked and the key in charge of a watchman night and day.

(*h*) The whole of the amalgam taken from the plates during each 24 hours to be cleaned and squeezed by the two amalgamators on duty every forenoon at 9 o'clock in the presence of the mill manager, who should weigh each lot, and enter it in a book to be kept for the purpose, and the entry to be signed by the mill manager and both amalgamators as witnesses.

(*i*) Every alternate Friday the mortars to be cleaned out; the work to be commenced punctually at 8 A. M. by the six amalgamators in the presence of the mill manager, assisted by the three amalgam cleaning-room watchmen and the four battery feeders on duty, prohibiting any of them from leaving until the cleaning-up was finished, and the amalgam cleaned, squeezed and weighed, and the amount entered by the mill manager in the record book and attested by the amalgamators.

I think the intelligent reader (particularly those with a knowledge of the business) will see the drift of the above regulations, viz., for there to be any peculation the whole of the battery staff—14 in all—would have to participate in it, and the number was too many to keep a secret. Formerly the amalgam cleaning-room was sacred to the mill manager, and on announcing to that official the new instructions, he at once tendered his resignation in a tone of offended dignity, immediately followed by that of the mine manager. It is a significant fact that shortly afterwards these two officials purchased a large mill and other property at a cost of over £10,000, and that the mine yielded for the following three years during which I was connected with it, an average of over 17 dwts. to the ton, as against formerly 10 to 12 dwts.

The reader must draw his own conclusions. I used to make it a practice to visit the mine daily and prospect the ore, and having the mine and mill managers' daily prospecting as a guide as well as my own, every man at the mill knew it was impossible for them to thieve without my detecting it; moreover, I made it a rule to discharge any of the mill employes that I discovered were interested in any small private claims.

The crux of the whole thing is having the practical miner at the head of affairs, and it is impossible for him to thieve if the work is carried out in the manner I have described.

Working Aluminium

Aluminium can be easily melted in ordinary fire-clay crucibles, without becoming brittle or taking up silicon, provided that no flux is used, and that the temperature does not exceed its melting point. The cohesion of the aluminium particles amongst themselves is much greater than their adhesion to the material of the crucible. Any addition of flux will bring about a contact, and then the absorption of silicon commences at once.

Aluminium may also be melted without harm in iron crucibles, if the necessary care be taken with regard to the temperature. At a dark red heat no alloying of aluminium with iron takes place, and even if taking place, the alloy containing iron has such a high melting-point that it sticks to the sides of the crucible. In this way some aluminium may pass over to the crucible, but no iron can be taken up by the metal.

Notwithstanding this, the greatest care is recommended in using fire-clay or iron crucibles, especially with unskilled laborers, because the least carelessness or error in judging the right temperature may turn the best material into a second-class metal, unfit to be used for certain purposes.

It is, therefore, under all circumstances, advisable to line the crucible with charcoal, or a mixture of any indifferent oxide mixed with tar. Such crucibles, in all sizes, may be got from the Neuhausen Company. If properly covered when in use they will keep several months and may be used without any extra precaution being necessary.

If the melting be carried out in a closed hearth furnace, we are advised that care must be taken that no pieces of coke fall into the crucible at the time fresh fuel is supplied.

Large quantities of aluminium are, we are informed, says a writer in *Invention*, melted in reverberatory furnaces, and in these cases also the hearths should be lined with indifferent oxides, and for the fuel, wood or gas should be used. The cleanest way is obviously to melt it by electricity, but this is only practicable in those works which can efficiently dispose of an electric current.

The heat of fusion should reach a dark red only. Notwithstanding its low melting-point, aluminium requires much time and heat for this process, in consequence of its high specific and latent heat of fusion previously referred to.

If objects cast in sand are required to have the color of silver, they should not, we are told, be cast at an intense red heat, otherwise they will turn out a very poor color.

Whilst other slowly-softening metals, like copper or malleable iron, are very pasty in the molten state, the contrary is the case with aluminium. It is a valuable property of the metal that it does not need, like other metals, to be heated far above its melting-point to become fluid. As long as the temperature, when casting, does not exceed a dark red, there is no fear of the aluminium combining with the sand of the mold.

As regards the molds, the heavy shrinkage of aluminium must be taken into consideration. Thick parts should be connected with large heads to give a broad cut-off surface.

There is no fear, we are assured, of pure aluminium, when being cast, taking up any impurities in the way of oxide scum, as is the case with aluminium bronze.

Castings in chills need a higher temperature than those made in sand, and the molds should always be previously well warmed.

Before casting, we are instructed that the mass should be well stirred with a charcoal stick, skimmed with a carbon plate, and finally well blown off.

The loss in remelting compact pieces appears to be no heavier, but rather less, than with other metals. It varies, we are told, from 2.6 per cent, according to the size of the pieces. Turnings and shavings lose on an average 10.15 per cent, and fine dust up to 60 per cent. It is said that the most advantageous way to remelt small quantities of waste aluminium is to make them first up into the form of bricks, to pump the air out of them, and to suck in light oils which leave but little ash.

Refuse from castings and ashes are ground in a crushing mill; small quantities pulverized in a mortar, and then sifted. The metallic parts are pressed flat during the milling operation, and will remain in the sieve whilst the earthen parts pass through in the form of powder.

The forging of aluminium will be successful if the metal is always kept near the annealing temperature, which shall never exceed 450 degrees C. Articles which should be very hard must be forged cold. With reference to this, the forging, rolling and pressing in the cold state will, we learn, be accepted as the best manner in general, as the fact must not be lost sight of that aluminium forged or rolled hot has very little strength, and is very soft, the same as cast aluminium; whilst cold worked it will reach the strength of phospbor bronze, besides possessing a certain hardness and elasticity.

It will also be understood that before forging all defects originating from the casting will have to be cut or planed off, otherwise cracks during the forging will occur. Aluminium containing silicon and iron cannot, we are told, be forged.

Metal of similar quality to that above mentioned can be rolled very easily, like gold or silver. Tin, although very soft, we are informed, can in no way compete with aluminium in this respect. The fact that leaf-silver has been totally driven out of the market, and replaced by leaf-aluminium, we are reminded, speaks for its great malleability more effectually than any words could do.

To put the metal into a form suitable for the operation of rolling, it is first cast in molds into large blocks, cleaned from any impurities, and divided with a cutting machine. Any rings or marks arising from the cutting must be taken off by filing, planing, or grinding. The blocks prepared in this manner are put into a muffle furnace, and brought to a temperature similar to that for forging. On the blooming and middle roll the metal should always be rolled hot; afterwards it can be rolled cold. Any sheets which may have become hard and springy during the operation, need only a slight annealing for the last turn if required to be soft.

Changes in the General Game Law.

Attorney Deering of the Fish and Game Commissioners, in answer to a question relative to the changes which have been made in the general game law of California by the supervisors of the interior counties, gave the following list of alterations in the open seasons, which will prove decidedly interesting to sportsmen in general:

Under the general law of the State the killing of game and the catching of fish are allowed only during the following seasons, viz.: Deer from September 1 to October 15; quail from September 1 to March 1; doves from August 1 to March 1; ducks from September 1 to March 1; trout, from April 1 to Nov. 1.

The above open seasons have, however, been changed in some of the counties by local ordinances, and in such counties the local law prevails. The counties which have up to the present made changes in the general law are as follows:

Deer—August 15 to October 1, Colusa; July 1 to December 15, Humboldt; July 15 to September 1, Los Angeles; July 15 to August 15, Marin; September 15 to December 1, Nevada; July 15 to September 1, San Mateo; July 15 to November 1, Shasta; September 1 to November 15, Siskiyou; July 22 to September 4, Sonoma; July 15 to October 15, Tehama; July 15 to September 15, Ventura; August 15 to October 1, Glenn.

Although the supervisors of the above counties made the foregoing changes in the general deer law, yet, owing to the lateness in advertising, the seasons will not open in Marin county until July 24, in San Mateo county until July 25, in Shasta county until August 1, and in Los Angeles county until July 29.

Quail—September 10 to March 1, Humboldt; October 1 to February 1, Marin; August 1 to March 1, Napa; October 1 to March 1, Nevada; September 15 to March 1, Placer; September 15 to March 1, San Mateo; September 1 to February 1, Siskiyou; October 1 to March 1, Yuba; October 1 to March 15, El Dorado.

Doves—July 1 to March 1, Colusa; June 15 to March 1, Contra Costa; June 1 to January 1, Humboldt; August 1 to January 1, Marin; July 1 to March 1, Monterey; July 1 to March 1, Nevada; July 1 to January 1, Placer; July 25 to December 1, San Mateo; June 25 to January 1, Shasta; July 15 to January 1, Sutter; July 1 to January 1, Tehama; July 1 to March 1, Yuba.

Duck—Attorney Deering said that very few changes have been made in the State laws by the county boards and they are as follows: Monterey, from August 1 to March 1; San Diego, September 1 to May 15; Yuba, September 15 to March 15.

In Ventura county the shooting of quail, doves and wild ducks for market is prohibited at all seasons.

In Yuba the hunting and trapping of pheasants is prohibited, and in Glenn county the killing of Mongolian pheasants and fishing for black bass is prohibited.

It was stated that the Supervisors of Mendocino county had ordained at a recent meeting that it will be unlawful to shoot deer in Mendocino county until July, 1895. This report has not yet been verified, however.

Brannt's Varnishes, Lacquers,

Printing Inks and Sealing-Waxes.

JUST READY.

Varnishes, Lacquers, Printing Inks and Sealing-Waxes: Their Raw Materials and their Manufacture. To which is added the Art of Varnishing and Lacquering, including the Preparation of Puttles and of Stains for Wood, Ivory, Bone, Horn, and Leather. By Wm. T. Brannt, Editor of "The The Techno-Chemical Receipt Book" Illustrated by 39 engravings.

In one volume, 12mo, 338 pages, price $3.00, by mail, free of postage to any address in the world.

ABSTRACT OF CONTENTS. — I. Introduction. II. Raw Materials. III. Oxidizing Agents (Driers). for Converting Oils into Siccative or Soiled Oils. IV. Dissolving, Roasting and Distilling of Resins. V. Preparation of Siccative or Soiled Oil. VI. Preparation of Oil or Fat Varnishes. VII. Preparation of Volatile or Spirit Varnishes and Lacquers. VIII. Miscellaneous Varnishes and Lacquers. IX. Manufacture of Printing Ink. X. Fabrication of Sealing-Wax, Appendix. The Art of Varnishing and Lacquering. Index.

Price $3.00, by mail, free of postage, to any address in the world

Mechanical Progress.

Firebox Steel.

The subject of the quality and inspection of steel for fireboxes was discussed at the recent convention of the American Master Mechanics' Association. The following brief paper was presented by Mr. William McIntosh, Division Master Mechanic of the Chicago & Northwestern R. R., at a recent meeting of the Northwest Railway Club:

The expense of renewing firebox sheets is so great that railway companies can afford to pay much more for this steel than they are now paying if by so doing they can procure material that will give longer service. The value of the steel sheets used in repairing and constructing fireboxes represents but a small part of the cost of such repairs and renewals. I estimate not more than 10 per cent. On the one hand, we have the cost of material and on the other we have the labor that is required in this work, the expense of tearing down machinery that otherwise would not have to be disturbed, and the loss of service of the engine, which, for the time required to put in a new firebox, would average not less than six weeks or 45 days and amount to $360, on a conservative estimate of $8 per day as the value of such service. This item alone aggregates several times the value of the steel needed for the new box. It is therefore obvious that if it were possible to procure a better quality of steel, even at double the price we are now paying, which would render one-half longer service, it would be wisdom to get it. This does not admit of discussion.

The questions now arise: Where are we going to obtain this good steel? Is it in the market? Can it be manufactured? My knowledge of the manufacture is limited, and I will not undertake to do more than say that I think such a quality of steel can be procured at the figures now quoted or even at a less cost. The quality of firebox steel has either deteriorated during the past ten years or the conditions of service have so radically changed that it is destroyed much quicker. I draw these conclusions from observations during that period, and as an illustration I will say that I have taken out fireboxes within the past few years that had been in service from eight to ten years, and I have recently removed firehoxes that have been in service but four years. I have also renewed sheets that were in service but one year. The firebox that gave ten year's service was crucible steel, and the sheets that lasted but one year were from the open-hearth furnace. Whether the latter process allows the raw material of an inferior quality to be introduced I am not prepared to say positively, but I think it does. That only the best of material is used in the former process goes without question. Whether the open-hearth process can produce a better quality of steel by taking the same quality of metal to commence with that the crucible method uses, is a question that steel-makers can best determine. The subject is one well worth investigating, as there is a wide margin of economy outlined in this proposition. Complaints are general throughout the western country about the unsatisfactory service obtained from firebox sheets, and it is my opinion that if some enterprising manufacturer produces a superior quality of steel he will find plenty of purchasers for it.

The Economy of Special Tools.

The modern processes of manufacture have been reduced in many cases by sheer financial necessity to such systematic arrangement as to make possible the production of a multitude of articles far within their cost by the older methods. The milling machine, the turret lathe and the screw machine are daily turning out by hundreds what the lathe and planer can only make by tens. And yet the relative economy of these new tools is to the greatest degree dependent upon the number of pieces to be made. It is the wise man who knows when, and when not, to prepare special tools, jigs and templates, so that, notwithstanding their increased first cost, his completed article may be more cheaply made. Likewise, the minute division of labor, that makes of every workman a specialist and an expert, is warranted only by multiplicity of similar pieces and operations. In the manufacture of watches, for instance, this is carried out to a degree that would have opened wide the eyes of a manufacturer 25 years ago. At the World's Fair, in the exhibit of the American Watch Company, is displayed a specially designed continuous lathe, so ingenious in its construction and so accurately timed in its movements, that the piece fed in at one end is clamped in a chuck operated upon by a single tool, released at just the instant when an automatic finger has grasped it, is swung around to another chuck, dropped by the finger as soon as caught by the chuck, operated upon by another special tool, and then sent along on its journey to successive tools in the same general machine. This masterpiece of machine design doubtless effects a saving in the cost of the finished pieces that pays a handsome interest upon its first cost, and yet what economy could there be in the use of a similar, but stronger, machine in the ordinary machine shop. Surely the end must justify the means, and one of the first principles in the introduction of such a machine must be to determine its interest account per piece made, and add this to the actual cost of the piece, in deciding upon the economy of its use. A machine for ordinary manufacture that cannot be almost continuously employed must show marked economy in its operations to prove a financial success. Nevertheless, when the articles made are great in numbers, the skill acquired by the workman who performs only a single operation, and the perfection of result with reduction of time attained by the special tool, render the entire process systematic, decrease the cost and improve the quality of the completed piece.—Iron Age.

A Slag Steam Generator.

Several attempts have been made in this country to contrive some practical method of utilizing the waste heat contained in the furnace slag for the production of steam for motive power purposes. An Australian paper states that the problem has been solved by two gentlemen who have an apparatus at work on a slag dump in the Broken Hill district. The machine consists of a steel shell in the form of a strong egg-ended receiver, having flattened faces on the top and bottom. Through these flat portions a number of Galloway tubes, arranged in two rows, and which are tapered from five inches at the top to ten inches at the bottom, are passed, and secured to the shell by flanges. The lower or larger end of each tube is closed by means of a cast-iron door, which is manipulated by means of a convenient lever. The upper end of each tube is provided with a funnel for convenience in pouring the slag into the tubes, and a pair of iron rails pass across the upper face of the boiler and all the funnels, and thus serve as a track for the slag pots. At each end of the boiler a bin is provided, into which is dumped the skin of the slag, which always sets on the cast-iron pots from which it is poured, and this red-hot material lying against the ends of the boiler plates serves to conserve the heat at the same time, and impart additional heat to the water.

The *modus operandi* is as follows: The boiler being filled with water to the required level, the slag is poured into the tubes at one time, just as it comes from the furnaces. As soon as the tubes—which are 24 in number in the machine now at work—are full, the first tube filled is emptied by merely releasing the lever which controls the door, and a conical cast of cool slag drops into the truck below, which is provided for its reception. The operation is continued with the various tubes, and as soon as the truck is loaded it is conveyed to the edge of the dump by means of a horse or some other convenient power and tipped over. As the tubes are emptied they are refilled with molten slag, and in this manner the work is conducted continuously. At the conclusion of a 72-hour test the boiler was emptied, and the tubes and all portions of it were carefully examined, it being a moot point in the opinion of some as to whether the slag would have deteriorating action on the tubes. The most minute examination failed to detect the slightest action of any description, so the boiler was filled and subjected to a hydraulic test of 180 pounds to the square inch, an ordeal which it withstood perfectly.

POWER FROM NIAGARA FALLS.—Announcement has been made within the past few days that quite a number of manufacturing enterprises scattered through Pennsylvania and New York will move their plants in order to secure power from the Niagara Falls Power Company. This great enterprise of utilizing the water power at Niagara falls and transmitting it electrically to points some miles distant has been pushed almost to completion. Few, if any, undertakings of the kind have ever been more carefully begun or more vigorously carried forward. The company has taken a great number of contracts to furnish power for different plants beginning September 1st. While various sections of the country will suffer the loss of plants projected or already in operation, as many such will be removed to points near the falls, the country as a whole will be proud of the enterprise.

Scientific Progress.

The Antarctic Whaling Expedition.

As many of our readers are doubtless aware, a whaling expedition comprising four ships—the Balæna, the Diana, the Active and the Polar Star—left Dundee in September last to try their fortunes among the whales and seals of the Antarctic ocean. Their destination was the region visited by Ross in his third Antarctic voyage in the years 1842–43; and the prime object of search the southern right whale (*Balæna australis*). Seeing how rarely the Antarctic regions are visited, and how imperfect is still our knowledge of their geography and natural history, it was arranged that the medical and some of the other officers of the expedition should endeavor to make observations and collect specimens so far as the exigencies of their other duties permitted.

The expedition has now returned safe and sound, and one of its members has contributed a preliminary account of its doings to the *Times*, from which we take the following summary:

It appears, indeed, that while much important information has been acquired as to the meteorology of the Antarctic, and some additions made to geographical science, the general scientific results are not so satisfactory as was hoped would have been the case; this being mainly due to the time of all persons on board being fully occupied in capturing and flensing seals, during the period when the vessels were in the most interesting regions. During a short stay in the Falklands, the officers learned that the Antarctic fox is becoming well-nigh extinct; while Darwin's prophecy that the wild horses and cattle would eventually be replaced by the more remunerative sheep is being rapidly fulfilled. Moreover, through incessant pursuit, the fur-seal, although still found, is comparatively rare.

The first iceberg was sighted in Lat. 59° 18′, and the same day (December 16th) Cape petrels and other members of the same order were met with in shoals, while the seas were found to be absolutely swarming with various species of finner whales. Soon after, the first seal was descried and promptly dispatched; the species is not identified, although it is stated to be one of those first discovered by Ross. On the 22d, flocks of sheathbills were met with, while, on the next day, the presence of the lovely white petrel and the olive color of the water indicated the proximity of the pack ice.

Although no right whales were sighted, a large number of seals, of various kinds, were taken, and by the middle of February the vessel in which the *Times'* correspondent sailed had secured its full quota. Three different kinds of seals were taken, which are described as the "large seal," the "white Antarctic seal" and the leopard seal. The species of the last is, of course, certain, while the second would appear to be the crab-eating *Lobodon carcinophaga*, and the first is probably Widdel's seal (*Leptonychotes weddeli*). Besides these, it is stated that the party came across a fourth kind of seal, described as of large size, with a small head, small flippers, thick blubber, and a rather woolly pellage.

Formation of Coal.

Nature is still making coal, though, unfortunately, not at a rate anything like fast enough to make up for the consumption of this product. The processes may be watched from beginning to end. For this purpose one must first go to a peat bed, which is simply an accumulation of the remains of plants that grew and decayed on the spot where they are now found. When the upper layer of this material is removed one finds peat with 52 to 66 per cent of carbon, and the deeper one goes the better in quality it gets. It may be cut out in blocks with sharp spades, the water may be pressed from the blocks, and they may be stacked up, covered and dried and used for fuel. There is a certain kind of moss, called "sphagnum," which in large part makes up the peat-producing vegetation. Its roots die annually, but from the living top new roots are set out each year. The workmen who dig peat understand that if this surface is destroyed the growth of the bed must stop; so commonly they remove the sod carefully, replacing it after they have taken out a stratum of peat. There is little doubt that if these beds of peat could lie undisturbed and covered over through many ages they would take on all the characteristics of mineral coal. The substance of coal has been so compressed that the forms of the plants composing it cannot usually be seen. But when a piece of it is made so thin that it will transmit light, and is then subjected to a powerful microscope, its vegetable structure may readily be distinguished. Immediately under every separate seam of coal there is a stratum of what is known as fire-clay. This stratum is always present, and contains in great abundance the fossil impressions of roots and stems and twigs, showing that it was once the soil from which vegetation grew luxuriantly. It is common, also, to find fossil tree stems lying mashed flat between the layers of black slate which form the roofs of coal mines, as well as impressions of the leaves, nuts and seeds which fell from these trees while they were living. In some beds of cannel coal whole trees have been found with roots, branches, leaves and seeds complete, and all converted into the same quality of coal as that by which they were surrounded. Geologists are of the opinion that bituminous and anthracite coals were formed during the same period and under like conditions. Originally they were all bituminous, but during the violent contortions and upheavals of the earth's crust at the close of the carboniferous age the bituminous coals involved in that disturbance were changed by heat and pressure and the consequent expulsion of volatile matter from bituminous to anthracite. Cannel coal is a variety of bituminous which burns with great freedom, the flame of it affording considerable light. It was called "candle coal" by the English people who first used it, as it often served as a substitute for candles. The name became corrupted to "cannel" and has so remained. It is more compact than ordinary bituminous coal and it can be wrought in a lathe and polished.—Black Diamond.

Scientific Education Invaluable.

Information concerning the positions that graduates of scientific schools obtain is readily gained by consulting the lists of graduates usually given, with their occupations, in catalogues of the best institutions. To generalize, a scientific school of good reputation feels, in granting a diploma to a student of marked ability, that it places to his credit a fund equivalent to not less than $10,000. This statement will doubtless be readily understood, if the instance he assumed of two young men of equal ability, one of whom graduates with honor from a scientific school at the age of 22 years, while the other engages in business with no assistance except his own energy and intelligence, which is true in a large majority of instances. Within four years after graduation the young man from the scientific school will receive an annual compensation of at least $1500.

The young man in business will meet with more than the average of success if at the end of four years he receives $3 per day for services, unless he is located in New York or Chicago. Independently, then, of the great satisfaction which any educated person derives from his attainments and the greater enjoyment of the best interests of life, which can only be appreciated by a cultivated mind, the young man who adopts a profession within three years after graduation receives an annual income of six per cent on $10,000 the difference between the annual salary and that of the young man in business. At the end of ten years those who studied faithfully while at the scientific school are receiving from $4000 to $8000 or $10,000 a year from their salaries alone, while men of equal original abilities are doing well if they can earn over $3000 without imperiling capital of their own.

THE *Electrical Review* of London notes that "the dome of the main lobby in the new building of the German Imperial Diet is being equipped with what is claimed to be the largest corona existing." The diameter of this corona is stated to be 26 feet, and it is being fitted with 12 arc and 250 incandescent lamps. The supposition that it is the largest corona in existence, however, is an error, for any one of the five great electric-light coronas in the manufactures building at the World's Fair is much larger. There are five of these coronas, and they light a space about 1300 feet long and 368 feet wide, inclosed by great steel trusses which extend to a height of 202 feet above the floor. The coronas are suspended by wire ropes at a distance of 140 feet from the floor. The larger is in the center and has a diameter of 75 feet, supporting 102 arc lamps; the others are each 60 feet in diameter, carrying 78 lamps. The lights, which hang in two concentric circles, number 414 in all.

ALUMINIUM IN MINES.—According to the *Moniteur Industriel*, the engineers of the principal coal mines of the Nord, in France, are studying the application of aluminium to the manufacture of cages, cables, etc.

NOTICE!

Bids are Asked until September 15, 1893,

For Constructing the

ESCONDIDO IRRIGATION SYSTEM

Estimated cost, $200,000. Write for particulars.

A. J. WERDEN.....Secretary.
Escondido, Cal.

EB. WILLIAMS,

ATTORNEY - AT - LAW,

NOGALES, ARIZONA.

Will give attention to the collection of claims and settlement of business in any part of Mexico.

Electricity.

Heating by Electricity.

In a long article in the *Manufacturer*, Mr. Campbell Scott says:

Such a quantity of electricity is necessary in operating electric railway systems that the loss of a small portion of it is hut a minor item to electric railway managers, and from the start they showed an eagerness to adopt any method possessing so many conveniences as electricity for heating their cars and making them comfortahle and attractive to their passengers. At the present time at least one-fourth of the electric railways of this country have their cars heated hy electricity, and from what I can learn a very satisfactory result is accomplished at hut a very slight cost.

The method employed is very simple, which is as follows: Underneath the seat of the cars, in three or four locations therein, one of these electric heaters is placed and a small portion of the electric current used in operating the motors of the cars is diverted through the heaters. The general method employed in this new form of heating device for heating cars is as follows: The frame of the heater is generally about eight or ten inches high, ahout six inches thick and about three feet long. A special "plaster" ls made, looking something like porcelain, when hard, in which very fine, especially prepared wires are embedded from one end to the other in zigzag fashion. The entire surface of the plaster is in this way embedded with the resistance wire, with the two ends of the wire protruding at one end, while in some cases several plates of plaster with these wires embedded therein are employed, after which the plaster substance is applied to the exposed surface of the wire, thoroughly encasing them therein. After this has heen done, the whole suhstance ls cooked until it resembles the hardest porcelain, with enamel finish. The exterior metal case, with legs underneath, is placed around this, and with sundry finishing touches we have an electric stove or heater. It must be understood first, before I describe the method by which the heat is produced through the abovementioned medium, that electricity always flows in what is technically known as a "circuit," *i. e.*, the electric current, after being developed from a generating source, must return to the same source. In other words, electricity will not flow or operate unless this circuit is maintained, for as soon as the circuit is hroken the flow ceases. Any metal will conduct electricity to a greater or less extent, but some metals possess the capacity of conveying a given amount of electric current with a far less loss than others. When we attempt to convey electricity through a bad conductor, we seem to "cramp" the electric current, and it seems that a great friction takes place thereln, which causes heat. In other words, when an electrical conductor retards the passage of the current the conductor is heated and the greater the resistance offered by the conductor to the passage of the current, the greater is the intensity of the heat prnduced. Copper is considered one of the best conductors and offers but little resistance to the flow of the electric current, while such metals as platinum, German silver, etc., are termed poor conductors, and on this account offer great resistance to the current's passage, and consequently, in them, the current produces heat. In electric heaters above described, very poor results would be obtained if the wires employed therein were composed of copper, which offers a very low resistance to the passage of the current, while the best results are obtained from the use of fine, especially prepared wire, which offers a very high resistance to the current's passage and consequently causes the production of heat. This special resistance wire being embedded in the plaster is practically protected from the outside air, and a very high heat is produced, which is conveyed to the enamel, the intensity of heat being governed by the quantity of this resistance wire employed, also by the quantity of current which flows through it. For several years a number of inventors have been at work endeavoring to so perfect this system of heating that it will be available for many of the commercial and domestic uses where small heated surfaces are necessary.

Hydraulics Versus Electricity.

As the electric crane recently completed at Southampton is the first of its kind erected in this country, its performance will be watched by many with conslderable interest. Hydraulic cranes have for some time retained the supremacy for all shipping work, and have proved themselves very efficient and reliable, having also the advantage of great simplicity. The principal disadvantages, however, of hydraulic cranes are the heavy loss of "head" in the main due to friction, the liability to freezing ln cold weather, and the fact that the power used is nearly the same for light loads as for heavy ones. A comparison, however, as to the relative cost of working each system is hardly possihle at the present time, hut we believe that the commercial efficiency of good electromotors is quite equal to that of hydraulic motors, if not superior, at equal loads, whilst the gain ln operating light lifts must be considerably in favor of electricity. Considerable economy is effected in first cost of mains and in the loss of head or voltage due to long distance transmission; also for work of a very intermittent character, and when there is an electricity supply company within reasonahle distance there is this great advantage, that the cost of the generatlng station is not laid directly on the consumer, and the lahor, expenditure and capital cost is thereby much reduced. We helieve there is a considerable field for the new-comers, and should the working cost compare favorably after due trial, hydraulic crane makers will have to look to their laurels. The Southampton Harbor Board are to be congratulated on the liheral and go-ahead policy they are adopting. We are of opinion that the time is not far distant when electrically-operated cranes for many purposes, in which other powers have hitherto heen used, will be the rule rather than the exception.—Industries and Iron (London).

The Electric Fans.

"What a world of comfort electric fans foretell." Non-owners of electric fans, can you imagine what this little device can do for you, what a privilege it is to sit durlng the hottest kind of a "sizzard" with the windows closed down tight to shut out the heat, in the delightful breeze caused by an electric fan? Think of the delicious enjoyment, almnst touched, we might think, wlth a little feeling of superiority over the sweltering multitude as they pant on in thelr respective paths of duty. You smile audibly to yourself as you watch some particularly perspiring individual, generally of the kind who might say wlth Hamlet, "Oh, would that this too solid flesh would melt!" He madly rushes to catch a street-car when another follows at a distance of a few feet.

Then you moralize a little and hegin to believe that you are really better off than somebody else. Dog days do make people so pessimistic. Every one knows you can't help it. General Humidity is blamed, and rightly, too. But you, dear reader, if you are the fortunate possessor of an electric fan, may rise above the surging multitude and look down upon them in your snperior wlsdom, for you become wiser when you own one. This has become an established fact. Charles Lamb in all his glory could not do justice to the electric fan.

Think what an alleviator of suffering it may be. Oh, yes, it has its pathetlc side also. Let us go hack, for a little while, to a period 30 years ago. There were no electrlc fans in those days. Let us select a particular incident, a most pathetic one.

On the top floor of a house, not too well supplied with the luxuries of life, tossing on a bed of pain, lies a little sufferer. Beads of perspiration are seen upon her forehead. It is the middle of summer. The heat is intense. Patiently at the side of the bed sits the mother, and not for an instant does she relax the regular motion of her arm as she fans the child. Now she changes the palmetto leaf to the other hand; the lahored breathings of the one in pain are heard, and the waving and rustling of the fan is the only sound which seems to penetrate the thick, heat-laden air. The observer wonders when she will tire. Never, unless exhaustion overtakes her, for she is a mother, and it is her offspring for whom she is laboring. It is, indeed, labor of the most tiring kind.

What a difference there would be were the fan-motor to take her place. Think of the grateful breeze cooling the fevered brow of its merry hum. One can almost lmagine oneself at the most fashionable summer resort with a ten-dollar-a-day sea breeze whistling merrily through his waving locks. Oh! it is glorlous. Buy a fan. Shut your eyes and see for yourself.—Electrical Review.

TURPIN, the inventor of melinite, has submitted to the French War Office an electric gun alleged to be capable of discharging 25,000 projectlles in five minutes, and to have a range of several miles. The apparatus is comparatively light in weight, so that it can be drawn by two horses and worked by four men. The projectiles are small shells charged with a secret chemical preparation, spreading death for 60 yards around. The English Government is said to he negotiating for the purchase of the invention, though skeptical of its value.

Useful Information.

Sweets Are Healthful.

If the English philosopher, Herhert Spencer, desired to make himself solid with the rising generation he could hardly have done it more surely than by commending sugar and candy as healthful foods, especially for the young. Children have always a strong liking for candy, and they almost always dislike fat. Older people, who have learned to eat fat meats, do not have the relish for sweets that children have. Mr. Spencer thinks that the instinctive liking for candy and sweets satisfies a need of the system. Large amounts of carhon are needed to maintain animal heat. Old people get this in starchy food. Children live largely on milk. This, except for the fat it contains, is not heat-producing. So if you want to keep children healthy give them small amounts of candy or sugar daily. The uncolored candies are least likely to be injurious.

Injury, of course, is possihle from overfeeding with candy as with everything else, but if given in small amounts every day sugar and candy are aids to digestion and will promote the general health. The notion that sugar and candy are unhealthful dates from the time when everything that was healthful was deemed evil. It is a relic of asceticism, and possibly reinforced by the consideration that sweets were unnaturally dear, and it is a thrifty thought to vote them unsafe to eat.

Since sugar has become much cheaper, its use in all forms has largely increased. If children are given sweets while young they will be less likely to have lung diseases and be ohliged to take cod liver oil when they they grow older. The cod liver oil is nearly pure carbon. That is why it fattens. But so too is sugar, and the carhon in that is in much pleasanter form to take.

It is important to unlearn our unfounded prejudices. That against sugar has been one of the most persistent. It does not do older people harm to do without sugar. They get carhon in other forms of food. But with children the pleasant taste of sweets increases the flow of saliva and helps digestion of everything that is eaten. The fact is well known by farmers in localities where sugar is made, that all who engage in its manufacture grow fat and sleek during the busiest season and when they are working the hardest. It is quite possible that this fact has had some relation to Herbert Spencer's theory on the subject. Mr. Spencer is one of the modern school of philosophers who find facts first and construct theories to harmonize with them. That is much better than the reversal of this process. The old cry that sugar was unhealthful has been unchallenged too long, especially as no facts were ever adduced in support.

Great Fairs of the World.

The first great International Exposition was held at London in 1851. It lasted 144 days. The buildings and grounds covered 21 acres; there were 17,000 exhihitors and 6,039,195 visitors, 41,933 daily. The receipts were $2,530,000 and the expenses $1,460,000.

In 1855 the second World's Fair was held at Paris. It continued 200 days, and covered 24½ acres. There were 21,779 exhibitors and 5,162,330 visitors, 25,811 a day. The cost is conjecturally stated at $1,700,000; the receipts were $1,280,000.

The third exposition was held in London in 1862. It continued 171 days, and covered 23½ acres of ground. There were 28,653 exhihitors and 6,211,103 visitors, a daily average of 36,325. It cost $2,300,000, and the receipts were $2,040,000.

The fourth was in Paris in 1867. It covered 37 acres aod continued 217 days. The exhibitors numbered 50,236, and the visitors 10,200,000, 47,470 daily. The cost was $4,000,000, the receipts were $2,100,000.

The fifth great World's Fair was in Vienna in 1873. The buildings covered 40 acres, and were occupied by 42,000 exhibitors. There were 7,254,687 admissions during 186 days, an average of 39,003 per day. The cost was $11,000,000; the receipts were $1,030,000.

The Philadelphia Exposition of 1876 was the sixth great display. The buildings covered 60 acres; there were 60,000 exhihitors, and 9,910,996 admissions, a daily average of 62,323. The cost is stated at $8,500,000; the receipts are said to have been $3,800,000.

The seventh International Fair was in Paris in 1878. The buildings covered 60 acres, and the exhihitors numbered 32,000. There were 13,000,000 admissions during 194 days, a daily average of 67,010. The official report makes no mention of cost or expenses, though it is believed the enterprise did not pay.

The eighth fair was at Paris in 1889. The huildings covered 75 acres, and were occupied hy 60,000 exhibitors. The exposition remained open 183 days, and was attended hy the astouoding numher of 32,354,111, a daily average of 181,170. The cost was $11,000,000; the receipts were $8,380,000.

Protean Uses of Petroleum.

Petroleum enters into a greater number of commercial products than any raw material, not excepting the cocoanut palm, which, as the Chinese say, has a good use for every day in the month. Petroleum can do better than that. The uses of crude petroleum hy actual count can he set down at 180; that would be a use for every day for six months. This astonishing result is due simply to the nature and chemical composition of the oll. Petroleum is protean.

Few people have any correct idea how petroleum enters into the manufacture of articles used to satisfy man's daily needs and comforts. How many people in Eastern cities that eat Western dressed beef know that petroleum was used in the cold-storage machine whlch preserved the meat? How many ladies ruhbing their faces or their hands with vaseline or "cold cream" have ever given a thought to the various processes through which petroleum must pass ere it is sold by the corner druggist?

How many travelers on the railway think that both the machinery of the locomotive and the delicate works of their watches are kept in running order by petroleum? How many boys and girls would chew gum if they knew they were chewing petroleum? How many invalids have an idea that their medlcine contains petroleum, or that the liniment or ointment which cures their pains and aches is petroleum? How many housekeepers, who burn petroleum in gasolne stoves, think there is petroleum in the "salad oil" with which they do their cooking? How many people know that the wool clothing on their backs has beeo scoured with petroleum? And so the list of curious questions which suggest their own answers might be multiplied almost indefinitely. The value of the petroleum extracted from the rocks of Pennsylvania during the past 35 years is equal to the amount of the national deht when it attained the highest point.—Tin and Stone.

A PERSON in good health with fair play easily resists cold. But when the health flags a little, and liberties are taken with the stomach or the nervous system, chill is easily taken, and according to the weak spot of the individual assumes the form of a cold or pneumonia, or it may be jaundice. Of all cases of "cold" probahly fatigue is one of the most efficient. A jaded man coming home at night from a long day's work, a growing youth losing two hours' sleep over evening parties two or three times a week, or a young lady "doing the season," and overfed children with a short allowance of sleep, are common lnstances of the victims of the cold. Luxury is favorable to chill-taking; very hot rooms, soft chairs, feather heds, create a sensitiveness that leads to catarrh. It is not, after all, the cold that is so much to be feared as the antecedent condition that gives the attack a chance to do harm. Some of the worst colds happen to those who do not leave their house or even thelr bed, and those who are most invulnerable are often those who are exposed to change of temperature, and who hy good sleep, cold bathing, and regular habits preserve the tone of their nervous system and circulation.

ONE of the rarest coins of the United States mintage was recently sold in Boston for $1200. It was a silver dollar of 1804. There are many stories about this issue of United States coin. It is said that there are not more than eight known to he in existence. According to the record of the United States mint, 19 570 sllver dollars were coined in 1804. One of the stories about the use of this mintage is that they were sent to Africa to pay off American sailors who were eogaged in a war on the Mediterranean with Tripoll at that time. It is said that the natives took a very great fancy to these coins and that sailors parted with them for souvenirs. It was stated that later the chiefs of tribes valned these dollars so highly as ornaments and tokens that they took great trouble to get possession of them and that, partly through rohhery and trickery, they succeeded in getting possession of all the dollars issued that year. The dollar of 1804 has a flying eagle with 13 stars upon

the reverse, while the face bears the date and the head of the goddess of liberty with floating hair.

I THINK the superb health of my family is to a great extent due to the habit we have of almost living in sunshine. Every bright day all of the shutters are open, and the entire house gets the benefit of sunlight. It drives away dampness, mold, microbes and blue-devils, and puts us all in good humor and health. I cannot imagine good sanitary conditions and darkness. Even my cellar is as light as I can possibly make it, and whatever fruit and delicacies need to be shut away from light I put in close cupboards or covered boxes. I have sheets of canvas that can be thrown over them before they are put away, and always take pains to so arrange my stores that nothing can be injured by an abundance of light. People who live in badly lighted apartments have little color and less health. I for one do not intend to spend my life in an atmosphere of gloom.—New York Ledger.

IT has been said that any good leather may be made waterproof by the following preparation: In half a pint of linseed oil scrape one ounce of beeswax, and add half an ounce of powdered rosin and one ounce of oil of turpentine. Melt all these ingredients very slowly on the fire, taking care that they do not ignite. A coarse earthen vessel is a good thing to melt them in. Saturate a pair of shoes with this mixture while it is warm, applying it with an old paint-brush. The shoes should be of new leather, and have never been wet, and, after they have been thus saturated, they should be hung at the back of the stove or in some equally warm place for at least ten days. At the end of this time they will not only be waterproof, but soft and pliable. The leather should be calf-skin or some strong leather for serviceable wear rather than fine kid.

TO remove oil stains from the pages of a book without destroying the printing, gently warm the stained part with a hot flatiron (so as to take out as much of the oil as possible) on blotting paper; then dip a brush in rectified spirits of turpentine and draw it gently over the sides of the paper, which must be kept warm during the whole process. Repeat the operation as many times as the thickness of the paper may require. When the oil is entirely removed, to restore the paper to its usual whiteness, dip another brush in highly rectified spirits of wine and draw it in like manner over the stained place, particularly around the edges. By adopting this plan, the spots will entirely vanish, and the paper resume its ordinary whiteness.

THE largest kite ever made in the United States is that produced in Durham, Greene county. The frame consists of two main sticks, 28 feet long, weighing each 100 pounds, and two cross-sticks 21 feet long and weighing 75 pounds each. All the sticks were 2x6 inches in dimensions. Over the framework was stretched a great sheet of white duck, 25x18 feet, which weighed 55 pounds. The tail of the kite alone weighed 50 pounds and contained 155 yards of muslin. Twenty-five hundred feet of one-half inch rope served as kite-strings. The plaything cost $100, and when it is mounted into the air it exerts a lifting power of 500 pounds. Six men once permitted it to ascend 1000 feet.—Albany (N. Y.) Express.

A WAY of determining weight of sheet iron without putting it on to the scales is thus described by the *Ironmonger*: It has been found by experience that a square foot of iron plate one-eighth of an inch thick weighed almost exactly five pounds, and this forms a basis for a very simple and easy rule. As a square foot of iron one-third of an inch thick weighs five pounds, a square foot of one-fourth-inch iron will weigh ten pounds, and we can say that the area of any sheet iron (or plate iron) in square feet multiplied by the thickness in one-eighths and multiplied by five, will give the weight of the piece.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is hcrally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

The Explorers' and Assayers Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C° BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Deuuistou's Silver Pleted Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.
BY C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5 Inserted in Dewey's patent binder, 50 cents additional per volume.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

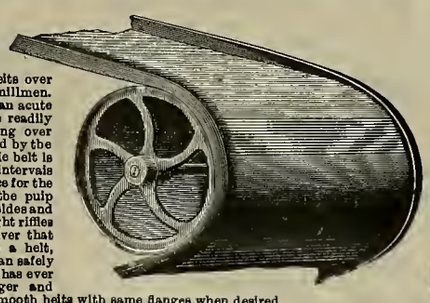
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

RICH ROCK FROM THE IAMA.—*Ledger*, July 21: S. H. Fredricks and Wesley Nichols, who have sunk a shaft 56 feet deep on the ridge between Pioneer creek and the Amador wagon-road, have drifted 80 feet along a ledge of $100-rock, taking out 16 tons and leaving exposed 100 tons more. Wednesday morning, D. Gutmann and George B. Heazleton came down from the Irma, after having spent several days at the property. During their stay a valuable discovery of quartz was made at the 100-foot level, where an orebody was encountered and many tons of rock exposed, which the mining men at the National hotel Tuesday night pronounced the finest they had seen for years. The rock assays about $250 per ton in free-milling gold. The Mattley ranch, which some months ago was bonded to J. B. Francis, will soon be the scene of active mining operations. A company is being formed for the purpose of prospecting the property, and within a month work will be commenced. Gutmann and Heazleton, the promoters are organizing a company with the understanding that a shaft will be sunk 1000 feet without cutting a station or running a level. They are discussing the proposition of putting in an electric hoist. Enough of the stock of the proposed company has already been spoken for to make possible the amount of prospecting contemplated. As it is intended to run all winter, it is necessary that work be commenced immediately, in order that a supply of material can be placed on the ground before the rainy weather sets in.

FORTIFIED AND GARRISONED.—*Ledger*, July 21: The visit of Attorney Eickoff to Jackson last week changed the condition of affairs at the Amador gold mine very materially. Under his instructions each building on the property was nailed up, all the fences and gates made secure, and notices posted warning people to keep off the premises. As a further protection six armed men were stationed over the premises with instructions to allow no trespassers to enter upon the property. These precautions were taken for the purpose of preventing the Amador Gold Mine, Limited (the English contingent), from securing possession of the property and thereby complicating matters. The English corporation has transferred its interests to a new company known as the Jackson Gold Fields, which, it is understood, will redeem the property before the 30th of this month, at which time the statutory right to redeem expires. The property was sold by the sheriff upon execution about six months ago, and was bid in by J. P. Darling, who represented the Amador Gold Mine, or the American contingent. There can be no question in regard to the Amador Gold Fields being determined to redeem the property, for the company's attorney, W. J. McGee, has been picking up some of the judgments that stand against the concern at fifty cents on the dollar. These judgments are in addition to those included in the execution upon which the property was sold.

El Dorado.

WORKING A BAR.—El Dorado *Republican*, July 22: A force of men was set to work this week on Diving Bell Bar in the Cosumnes river below Huse's bridge by the local company which was organized several months ago to work the ground, as reported at the time. They are getting lumber on the ground at present to construct 1000 feet of flume four feet wide to carry the river water at its low stage past the bar. The water will be diverted into the flume by a wing dam at the upper end. As soon as the ground is freed from this surface water, a hydraulic elevator will be operated from a ditch that will give about 100 feet fall. D. C. Wickham will manage the undertaking for the company in which he is also interested as a partner. Diving Bell Bar has a great reputation among the old residents of that part of the county as being very rich, but has been a difficult place to work on account of the water and difficult drainage.

GOLD MINING PROSPECTS.—Will Wilkinson has been pushing a tunnel on the old New York lead for some time and has secured some good prospects. The vein passes through his father's place and also through Paterson's and Dr. Baum's farther south, all being within the town limits. Wilkinson had 14 tons of ore milled on the Big Tunnel property last week, and it returned him $20 per ton. He has a tunnel in about 60 feet and has uncovered a four-foot ledge and some smaller veins. J. W. Dench owns the north extension on which some work has been done, a shaft being down 50 feet and a tunnel in 100 feet. Twenty tons of ore milled from this part of the vein gave $7.50 per ton. Kohn & Smith own ground on the same belt still farther north and have a tunnel about 100 feet long run into it. A sample of ore from their ledge yielded $7.50 per ton. Some of the capitalists who are looking for gold-bearing ledges ought to take a look at these properties.

Kern.

GOLER CAMP.—Los Angeles *Express*, July 22: Goler Camp is about 40 miles north of the horax road. It is situated in a little canyon with plenty of water. The climate is delightful on account of the elevation and dryness of the air. One needs a pair of blankets at night. A cool breeze is blowing nearly all the time, so that the hills of the Mojave desert are not the bugaboo we have always supposed. There can be no better climate for those suffering from pulmonary complaints. The trip from Mojave is not pleasant until the hills are reached. Water may be had at the Six Mile House; again at Kane's Springs, 20 miles farther; again at Mesquite Springs, three miles farther, and at the Borax pump, four miles toward Goler. Leaving the borax road at Mesquite Springs and taking the canyon brings one to the Colorado Camp and Big Nugget Gulch, where the $250 nugget was found June 27th last. From three to five men are working the Big Nugget Claim and have two dry washers. The owners think they have something good and are not on the sell. Harvey Hanson, the veteran prospector, is looking for the lead from which the big nugget came. Charles Fahey, of San Bernardino, has interests here and is now out looking at claims of Mr. Ayers, with a view to purchasing. The Benson boys are doing well, as are also Reid & Co. Many others are making from first-class wages up. Quite a number of miners and prospectors have come in within the last two weeks. The Bergeron & Barlingame Company will soon have its men at work developing its lodes.

Mono.

A SUCCESS.—Bridgeport *Chronicle-Union*, July 18: The Standard Con. electric works are a grand success, the mill of the company at Bodie now being run by the power, which is transmitted from the company's power-house on Green creek, a distance of 12 miles. The Electric Company is to make a 30 days' successful run before the Standard Con. can be asked to accept them under their contract. The time will expire in the early part of next month. We congratulate Superintendent Leggett on the success of his enterprise.

Nevada.

A DIVIDEND.—Grass Valley *Union*, July 21: Dividend No. 14, of 10 cents per share, has been declared by the W. Y. O. D. Mining Company, and is now payable at the bank of Messrs. Weissbein Bros. & Co. Up to date the mine has paid an aggregate amount of $1.20 per share. For the past few months extensive improvements have been in progress at the mine, involving a heavy outlay, yet it is able to declare a dividend this month. When the improvements shall have been completed, the indications are such that larger dividends will follow.

OSBORNE HILL MINE.—Grass Valley *Telegraph*, July 22: After the lapse of over 25 years, the Osborne Hill has resumed work. Mr. L. P. Goldstone has, for months, been getting a company together for the purpose of operating the famous old mine, and he has succeeded. Steam was started up about a week ago and everything is going on in a business like manner. A fine building has been erected over the hoisting works and the machinery is running just about as good as machinery can run. The shaft has been cleaned and newly timbered down to the depth of 250 feet and it is a substantial piece of work. Below this depth there is some water, but the pumps have no trouble whatever in handling the water. At the depth of 250 feet there is a large drift running south. The miners have cleaned out this drift for a short distance and found a ledge not entirely well defined as the quartz is a little mixed at present. The best miners say that it is bound to soon develop into a fine ledge. The drift is badly caved, but it is the intention to follow it up for some distance at least. In the meantime the shaft will be cleaned and timbered to the bottom, where sinking it further will be commenced. Many of our old timers remember how high excitement used to run about Osborne Hill when some of the splendid ore would be taken out, and they now all rejoice that after so many years have gone by that the old mine has entered again upon an active career. Mr. Goldstone has done some substantial work on top and underground, and the mere locality in which the mine is located should almost insure its success.

Placer.

MORNING STAR DIVIDEND.—Colfax *Sentinel*, July 22: The Morning Star mine of Iowa Hill has declared another dividend of $2 per share, aggregating $4800. This makes dividend No. 31 and many more are expected from the famous producer. The stockholders are mostly composed of Grass Valleyans and Colfaxans, and surely they have a "good thing" in the Morning Star. The mine is looking fine at present.

Sierra.

HOISTING WORKS.—*Mt. Messenger*, July 25: Hoisting works are being erected at the Rising Sun quartz mine, near Alleghany, and Supt. L. H. Newton expects to have them completed by the first of next month at the latest. We learn that a couple of fine ledges have been struck at the Mount Moriah mine, lately purchased by a Minnesota company of M. A. Lawler and Dan Glavin. Mr. McIntosh, the manager, has several men developing this property.

Siskiyou.

GULN DUET.—Yreka *Journal*, July 22: Cunha & Co., after a two months' run in their mining claim at Hawkineville, about two miles north of Yreka, formerly the old Tom Greenwood claim, cleaned up some 15 pounds of gold dust. They had free water all the time, this season having been favorable for a good supply in washing the pay gravel. Other claims in the vicinity on Rocky Gulch and Canal Gulch have also paid well the past spring and present summer. The river miners on Klamath river, in the Honolulu district, are all busy at present in sinking down to the old channel at their various claims, and will soon be taking out good quantities of the glittering dust. The Spangler Brothers at mouth of Humbug creek have a good deal of trouble in getting down to bed rock, on account of the extraordinary amount of water in the ground this season. They have to pump out both the Klamath river and Humbug creek water, and will be obliged to put in another pump. The bedrock is not less than 35 feet below the surface of the creek, but when reached for successful operation, will no doubt yield handsomely. They can run the pumps by water while their new double action steam engine performs the hoisting and removal of boulders. The Eastlick Bros.' mine at Oro Fino, Scott valley, cleaned up over $15,000 last week, the supply of water in their ditch for hydraulic mining being unusually good for this season. Jim Sterling has sold his quartz mine on Hungry creek, Siskiyou mountain, to an Oakland company, and is now making arrangements to build a wagon road from Cole's or some point in that vicinity to the mine. The Spencer mine in the Siskiyou foothills, near Cole's mountain house, still continues to pay handsomely, and bids fair to prove a permanent lode of great value, in fact a rich bonanza. A custom quartz mill on Siskiyou mountain, for crushing the quartz from Hungry creek and other creeks in that section, would develop a very rich quartz mining district, covering a vast extent of country in California and Oregon along the State boundary line. Jillson & Co., of Henley, are still piping in blue gravel at Klamath river in Cottonwood district, and will continue to do so until the water gives out, as it will take but little time and small amount of water in cleaning up. The lower strata of blue gravel will be blasted and dug out for crushing in an arrastre, owing to the trouble of dissolving by water, which method, it is believed, will prove successful in extracting the gold with less lose and expense. Henry Harris, the industrious quartz miner, is now prospecting a fine looking ledge on Trail Gulch, near the old saloon cabin on the Humbug road, just over the divide on Humbug creek. Rich quartz discoveries have been made at the head of Shasta river, about seven miles west of Igerna. W. N. Dale and Pat Kiernan have a ledge, nearly two feet in width, which prospects well, showing gold to the naked eye, and assaying over $600 to the ton. If this discovery should cause the development of other ledges in that section, a rich mining camp may be the result, as there is an abundance of water at hand for running mills and washing purposes. This locality is on the dividing range between the Shasta and Trinity rivers, where the Sacramento, Scott, Trinity and Shasta rivers originate from extensive springs.

A NEW DISTRICT.—Yreka *Journal*, July 26: The new quartz mining district on the headwaters of Shasta river, west of Igerna, continues to attract considerable attention, and gives promise of proving a rich mining section. Prospectors are searching in every direction for new ledges, with good success. The Ashland *Tidings* says Philip Mullen, of the Spencer quartz mine, near Coles, in this county, was at that place last week, and says the ledge cleans up $4000 a month with its little steam hammer mill of two stamps. The river miners on Klamath river, in the Honolulu district, are now beginning to wash up bedrock gravel, the Bentz Bar Company having sunk down two cuts, and the Centennial and other companies having also reached bedrock. The heavy rainstorm of May 8th last delayed operations to a great extent by breaking in wing, head and foot dams, besides interfering with getting derricks, wheels and other apparatus in place, as the river was raised about five feet, due mainly to heavy cloudbursts in the mountains and at the head of the stream. The Greenhorn Blue Gravel Company having made an opening to the old north shaft, now secure better air for safe working, as this opening provides a good draft. The men are drifting near the south shaft, and also opening the old underground drain from the old works, as water is getting scarce for washing the gravel taken out. The Spangler Brothers, at the mouth of Humbug creek, are putting in another pump to drain their claim, as one pump is only sufficient to keep the water stationary, the supply being just about equal to the capacity of the pump. Another pump will enable them to work successfully, and supply the money market with a good quantity of gold dust. J. H. Schroeder, of the Deadwood Mountain quartz mine, between Yreka and McAdams' creek, was in town last Saturday, and is kept quite busy of late in getting out quartz and keeping the mill running day and night. He has plenty of quartz out to keep the mill running perpetually, and intends to have enough at all times by working sufficient force in the tunnels. The mill is run by steam and there is an abundance of water on the mountain this season to supply the batteries, engine, and for all other purposes. The big current wheel built at American Bar claim on Klamath river below Hornbrook by an Oregon engineer, whose name is not Ferris of Chicago, is reported to have gone to pieces on first turn or half turn. It was 43 feet wide and 18 feet in diameter, constructed with a view of operating all the apparatus, in place of having a wheel for each purpose as in other claims. The remnants have been picked up all the way down the river, probably as far as the great sand dunes on the ocean beach, where the raging Klamath mingles with the placid Pacific. It may have been stout enough in the bucket beams, but the main shaft, made of wood, proved too weak to sustain the immense wheel. The claim prospects well and will yield handsomely with right kind of apparatus to work it. The McCloud river *Pioneer* says a large quartz mill is to be put up right away on a bonanza ledge about 12 miles from Round mountain and a few miles from Pitt river. The ledge is but slightly developed, but the ore prospects highly. We know of several mills having been erected at Copper City, and one at Bullskin, to work the quartz from "rich" but partially developed ledges, and the result was dead failures. Develop a mine, then put up machinery, is the safe miner's plan.

Tuolumne.

A REAL GOLD BRICK AT COLUMBIA.—*Union-Democrat*, July 22: We have often heard it said that everything some men touch turns to gold, but we have never seen it more thoroughly exemplified than in the case of our esteemed friend G. L. Mead, who some time ago purchased the old Masonic Hall, paying therefor the sum of $600, for mining purposes. Up to date the output has been nearly $4000 from the rear portion of the lot. Last week he began taking down the large brick building which covers the front part, the brick alone being of the best quality and worth many hundreds of dollars, but it is not this particularly of which we speak. One evening this week after he had finished his work on the building for the day, as he was about to go home to his cabin, he thought he saw something glittering in the pile of brick which lay at his feet, and on which the last rays of the setting sun were shining. Hastily picking up the broken brick in which the object lay embedded he was surprised and delighted to find it was a lump of virgin gold which weighed nearly three and one-half ounces, there being nearly $60 in the nugget. According to old timers the brick used in the construction of the building was made in Springfield from the auriferous clay which underlay the rich surface soil which yielded so enormously and made that locality so famous for its rich placer during the early fifties. It was said at the time the brick were made several pieces of gold were picked out of the clay by the workmen. L. C. Tibbitts and family are rusticating at the Last Chance mine. He contemplates resuming work on the Eagle and Yellow Hammer mines, both of which are promising properties.

NEVADA.

Washoe District.

COMSTOCK SITUATION. — Virginia *Chronicle*, July 25: A *Chronicle* reporter had an interview with Chas. H. Fish, president of the principal north-end mines, to-day, who arrived last Saturday on important business connected with the companies which he represents, and for the purpose of submitting propoeals to various corporations doing business with the mining management, looking to reductions in freights and fares, the price of water and lumber, and also to request a reduction in the present scale of wages paid miners and mechanics. It had already been agreed before Mr. Fish left San Francisco that the salaried officers of the various mining companies of which Mr. Fish is president, the Con. Cal. & Va., Ophir, Mexican, Union Con. and Sierra Nevada, have already been notified that on and after Tuesday next their salaries will be cut down at least 25 per cent, with the exception perhaps of the Virginia secretary of the Con. Cal. & Va., whose onerous duties entitle him to the salary at present received. Mr. Fish states that the percentage of reduction in officials' salaries has not been made equal, and in some cases will be as high as 50 per cent, owing to the large salaries received by some; and 25 per cent would cut no figure in the way of reduction. To-day the documents were mailed to the Virginia Miners' Union, Gold Hill Miners' Union, and Mechanics' Union of Storey county, setting forth reasons why a reduction of 25 per cent in the scale of wages paid should be made. Proposals have also been submitted to the Virginia & Truckee Railroad Company, Virginia & Gold Hill Water Company, Sierra Wood & Lumber Company—all having headquarters and agents in this city—asking a reduction in rates in conformity with the reductions contemplated in other quarters. The Lake Tahoe Wood & Fluming Company, located in Carson, will be served with a similar document. The documents transmitted to the various corporations and labor unions are signed by the presidents and secretaries of every mine on the Comstock, with the exception of two in Lower Gold Hill, whose works are at present shut down. It is not probable that the problem will be solved for at least a month. The various corporations will take time to consider the proposition, some of the interested officials of which are at present absent. Superintendent Yerington of the V. & T. will not arrive until to-morrow. Mr. Fish, having completed the business for which he visited the Comstock, will return this evening to San Francisco. There was no truth in the statement made by the San Francisco *Report* of Friday last that one of the objects of his visit to the Comstock was to look into the feasibility of shutting down the C. & C. shaft, and working the bonanza mines through the Ophir. The impracticability of such an arrangement is patent, and there is no danger of the C. & C. being shut down, unless for repairs.

Central District.

GOOD ORE.—*Silver State*, July 15: County Clerk Dunn arrived last night from Central district, where he has been working upon his gold mine for the past month. He is enthusiastic over his prospects, as the mine is showing up well, with plenty of rich ore in sight.

Comet District.

SUPPLIES.— Pioche *Record*, July 13: Ed. Freudenhall departed yesterday morning with a load of supplies for his mines in Comet district. He is so confident that silver will be restored in a short time to its full value that he told some of his friends he did not intend to come back to Pioche until the price of the white metal did raise.

Eureka District.

DULL.—Eureka *Sentinel*, July 22: Times were dull here previous to the great depreciation of silver, but now the condition is deplorable in the extreme, as there is no employment here of any kind for the laboring classes, and if no relief is afforded them in the next 60 days the wolf will be at the doors of many deserving persons.

Silver Peak District.

GOLD CLAIMS.—Walker Lake *Bulletin*, July 22: About 30 men are employed in the district. John Chatovich will start up his mill in about ten days. As this is nearly all a gold-producing country, the discount on silver effects the

miners very little. If the report that a prominent San Francisco capitalist intends to buy up the principal group of mines in this district proves true, this will soon be a lively camp. Sam Wasson made a 16 days' run at the Silver Peak mill last month and cleaned up $6590. The mill broke down on the 1st, but was started again on Wednesday.

Morey District.

SHUT DOWN.—Belmont *Courier*, July 24: We learn that Mr. Cohen has shut down the mines at Morey on account of the war on silver. The Rothschild Bros. are making their power felt in Nye county as well as in the balance of the United States.

Belmont District.

THE MILL. — Belmont *Courier*, July 22: Messrs. Warburton & Atwell are running the concentrator by steam power. The Monitor-Belmont mill's whistle was heard in town on Thursday afternoon last for the first time in years.

Tuscarora District.

NAVAJO.—*Times-Review*, July 22: The stopes above the 350-foot level show no improvement since last report. Those above the 150 level are looking about the same.

BELLE ISLE.—South intermediate No. 2 extended six feet, vein small but good grade. No. 2 upraise, same level, extended 11 feet. The stopes are looking about the same.

ARIZONA.

MINES CLOSED AT WHITE HILLS.—S. F. *Chronicle*, July 24: Judge Henry Schaefer, the discoverer of the noted White Hills mines, A. T., arrived here yesterday. He has just completed the sale of five patented claims in the Gold Basin district, 15 miles east of White Hills, to Sigafus & Bird of San Diego, and will now remain here for some time. He says that, owing to the silver depression, all the White Hills mines have closed down and a pay-roll of $1000 a day stopped to labor. The town is extremely quiet and must remain so, the Judge says, until the silver interests improve. He says that the White Hills developed as a leading gold camp, each ton of ore producing from one to six ounces of gold, but the stoppage of work has taken place, nevertheless, because of the attitude against silver. He thinks much the same thing is being repeated in many other camps, and it will only be a short time until there will not be sufficient gold even to answer the demands of the country. "I came up some time since from Arizona to Los Angeles," he said, "intending to invest about $16,000 in electrical engines, but the silver depression came and I did not invest a cent. One dealer there told me the fight against silver meant a loss of $1,500,000 a year to Los Angeles. It has retarded business in a thousand different ways, and will, I think, cause hard times in the East. Messrs. Sigafus & Bird, who purchased the Gold Basin mines in the Hualapias district, will proceed to work them as soon as the hot weather moderates a little.

ANOTHER FEEDER. — Tombstone *Prospector*, July 22: The Missouri copper group of 13 claims in Middle pass of the Dragoon mountains are being developed in a systematic manner by M. M. O'Gorman, who has them bonded until February next. It is understood that Dick Gird, of the Chino sugar ranch, who made his fortune out of the Tombstone mines in early days, is at the back of Mr. O'Gorman. The tunnel which is being run into the mountain is nearly 70 feet long, and during this distance has been all in ledge matter. Some good-sized veins of rich black oxide have been encountered, while the whole distance the ore will pay to smelt. The tunnel will be driven to the distance of 100 feet. It was the expectation to strike the hanging wall before this, but no sign of it has been uncovered. A great deal of the ore will run 60 per cent copper. That there is an immense deposit of copper there has been considered a certainty, but capital to develop it was not interested until Mr. E. Sydow located the properties and interested Mr. O'Gorman in them. A most valuable addition to our county will soon be in a productive shape. It is but 18 miles from Tombstone and is reached by as fine a natural road as ever was marked out in any country.

MILL DESTROYED.—Kingman *Miner*, July 20: The Big Sandy mill, at Signal, was discovered to be on fire at about 3:30 o'clock Wednesday afternoon, the fire bursting from the boiler room. The fire had attained too great headway to be overcome and the mill was soon a smouldering ruin. Although the mill has been idle for some years the tanks have to be kept full of water, and on Wednesday the watchman had fired up and was running the pumps. While absent from the boiler room a spark, it is supposed, flew from the furnace into some inflammable material and thus started the conflagration. The mill was built about five years ago by Hugo Richarde, of Prescott, and W. D. McCright, the Kimble brothers and some others of Signal, who afterwards sold the mill and the Signal mine to the present owners. The loss is said to be $60,000, covered by an insurance of $10,000. The burning of this mill is another backset to the town of Signal, and it was soon to be fitted up as a gold mill and work the gold ores from the surrounding camps.

MILL MACHINERY.—Hugh McCrum came in from San Francisco Saturday, where he has been purchasing additional machinery for the McCrum Sampling and Milling Company, with works at the Silver Belt mine. C. M. Clark left for the works last evening, and expects to have mill machinery in full operation by Wednesday. Mr. McCrum and his people have expended fully $13,000 on this enterprise up to date, and will without doubt soon commence to realize handsomely on the investment.

BIG BUG DISTRICT.—J. R. Ritchie, the mining man, was in yesterday from Big Bug district, at which place he is running the Pratt mill under lease, working ore from one of his claims, and also working custom ores. He is having a pipe line of 1000 feet laid to more conveniently handle the water supply.

COLORADO.

CLOSED DOWN.—*Mining Industry and Tradesman*, July 22: Since the mining news from Lake county was put in type, the information has come that the Maid and Henriette has closed down and is pulling its pumps. This was the greatest producer at Leadville and gave more employment to men in mine and smelter than any in the region. Mr. Moffat proposed to keep the mine in operation, on some scale, even at a loss, with wages at $2.50 per day. The Miners' Union refused to accept this rate. Such action by the miners is incomprehensible. Every mining camp in the State is full of idle men, hundreds of whom are in want. Every wagon-road and path in the mountains is full of men who are tramping and packing their blankets, every train on the railways carries men out of the country who are stealing their rides, relief committees are needed even in Leadville, and still these miners, at the dictation of a few stupid, hot-headed fools, refuse to work for $2.50 per day.

IDAHO.

WILL RESUME WORK.—Silver City *Avalanche*, July 22: We are informed by Superintendent Frederic Irwin, of the Idaho and Pittsburg Mining and Milling Company, that the company's mill will be started to-day (Saturday). Our readers will remember that the property was completely shut down on July 1st, when the price of silver fell from 82 to 60 cents. Enough ore is mined to keep the mill running steadily until the middle of August, and it is hoped by the company, as well as everyone in the camp, that before that time the "powers that be" will have brought about a change which will enable the owners to see their way clear to resume operations in the mines and keep the mill running steadily. The Black Jack is one of our richest and largest producers, but its value is so largely in silver that present prices render it impossible for it to be worked at a profit. The management had extensive improvements under way at the time orders were received to close the property, work on which will not be recommenced until the monetary question is settled. The men who were employed in the mill at the time it was shut down are given work again, and are now back on the mountain.

CUSTER COUNTY MINES.—Salt Lake *Tribune*, "Not a mine of any prominence in Custer county is in operation to-day," said A. J. Crook of Clayton, Custer county. "Never in the history of that rich galena-silver ore-producing country has the outlook appeared so gloomy. With silver at 63 cents per ounce, the mine-owners in my section of the State would lose about $4.60 per ton on all ores shipped to the Denver or Omaha smelters. We don't propose to lose that amount, and have closed our mines. Some development work is being done at each of the principal mines of the county, but not an extra man is receiving employment. The mines near Clayton will probably start up about the 1st of September and run possibly 60 days. The smelter will also be started to work some valuable ore already on the dumps. As our supply of coke is limited, the run will, of necessity, be a very short one. The mines at Bayhorse will not run at all this season except to work particularly rich veins, and the mills will be in operation only long enough to clean up the ore now on the dumps. We cannot run mines in that section at a profit with silver selling less than 95 cents an ounce. In the first place, coke laid down in Clayton costs us $35 per ton as against $6.50 in Denver or Omaha; we have a 72-mile haul in order to reach the railroad. Everything the mine-owner uses in the treatment of his ores, and everything the miner uses and needs, costs too much and is way out of proportion to the market price of the only commodity which we have to offer—silver." As to what he intended doing, Mr. Crook said: "I have found it necessary to get out of that country, at least for the present, and have set about looking up gold properties and agricultural land, for outside of a gold mine I consider a tract of fruit and agricultural land the most valuable.

LOST RIVER COPPER MINES. — Wood River *Times*, July 22: A party headed by Franklin Farrell, president of the Parrott Mining Company, and Benjamin Tibbey, a noted practical expert of the same company, of Butte, Montana, spent the last week at and around Ketchum and at the copper mines owned by Messrs. Sharp, Reed, Davidson and others, on Lost River, and left on yesterday's train for their homes — Mr. Farrell for Connecticut, where he has large foundry interests at Waterbury and Ansonia. The gentlemen of the party are heavy capitalists, ranking away up in the millions. They were very favorably impressed with the copper prospects, and intimated that they may take hold of them.

MONTANA.

AT ANACONDA.—*Review*, July 20: The Anaconda Company are grinding along in about their usual manner. They are handling 70 cars ore per day at the upper and lower works. They are getting their wood from Mill Creek. They have about the usual force of men at work. There can be no question but they are preparing to very materially increase their output soon, probably about the time the new railroad is completed, when they can ship on their own line. It is now stated that the company have changed their plans about the connections with the mines at Butte and will connect on the east side. The change was brought about on account of the large amounts asked by property owners over whose property the line would pass. At the Anaconda and St. Lawrence, development work is still in progress on the 1200-foot level of the former and the 1100 of the saint. At the latter property a number of men have been laid off until the work of cutting the station is completed, but ore is being hoisted in large quantities from both mines and about 70 cars daily are being shipped to the smelter. The High Ore is employing about 160 men, and the Green Mountain will soon be employing double that number. At the Mountain Con. or Buffalo new shaft development work is in progress, and as soon as connections are made with the old workings, work will be resumed with old-time vigor. The same may be said of the Humboldt, the new shaft of the Anaconda Company. Parties in from French Gulch say that placer properties there continue to look up; that they will soon be taking out pay. It is understood that parties are now in Anaconda who are arranging to bond one or two of the Daly mines, near Cable. If the arrangement is completed a small force will soon be put to work on development. The fire-clay banks about Anaconda have proved quite valuable. The ones over on Lost Creek and those southeast of town are taking out material every day, which is brought to Anaconda. Some of it is shipped to Helena.

NEW MEXICO.

NOT PROMISING.—*Southwest Sentinel*, July 22: A few men are at work in the mines at Georgetown under leases, but if there is not an improvement in the price of silver it is not probable that they will continue work much longer. The outlook for Georgetown is not very promising just now.

PINOS ALTOS.—The scarcity of water at Pinos Altos this summer has been a very serious drawback to mining operations there. There is a large amount of ore out on the dumps and in the mills which cannot be treated until there is a supply of water to keep the mills going. With plenty of water at Pinos Altos there would be no trouble about keeping the mines there in continuous operation. Various plans have been proposed to supply the camp with water, but none of them have been deemed feasible enough to put into operation. If artesian water could be obtained there, the problem would be solved. An artesian well could be put down for a small fraction of what it would cost to pipe water into the camp. The experiment is worth trying. If artesian water could be found at Pinos Altos, the camp would be restored to its place at the head of the mining camps of the Territory.

PYRAMID.—There is a small force of miners at work at Pyramid, but the work being done in other camps in this county south of the Southern Pacific railroad is inconsiderable. With silver even at a dollar an ounce, the number of miners employed in that part of the county would be many times as more than are now at work.

COOK'S PEAK.—There is no early prospect that operation will be resumed on a large scale in Cook's Peak district. There has been considerable development work done there within the past few months, and large bodies of ore are exposed ready to be taken out. The mines are in such a shape that an output of over a hundred tons a day could be kept up for some time. The mines in the camp were never in better condition than they are now.

OREGON.

STRIKE IN THE VIRTUE MINE.—*Bedrock Democrat*, July 24: Just before the First National Bank opened its doors for business yesterday morning, Superintendent George W. Borman and Book-keeper I. H. McCord of the Virtue mine entered the side door and a few minutes after the front doors flew open and in rushed an excited crowd. Thinking that it was a rush of depositors, a *Democrat* reporter immediately made his way to the First National, and instead of being compelled to report a bank failure he was shown an 8½-pound specimen taken from the shaft of the Virtue mine, which fairly glistened with the yellow metal. In fact, the huge specimen is almost literally covered with gold, which stands out in big chunks. It is estimated that the gold in the rock is worth between $1000 and $1200. We were next shown two sacks filled with the same stuff, and taking from his pocket Superintendent Borman displayed a specimen as big as a man's fist, which is worth its weight in gold. The ore will foot up to something like $10,000. As soon as an opportunity was presented, the reporter was granted an interview with Mr. Borman. He said: "We struck the bottom of the shaft, 350 feet, yesterday evening, the first time it has been entirely free from water since the mine was shut down six years ago. I expected to see a fine vein of quartz, but when my optics feasted upon an eight-inch vein of the stuff you just saw in those sacks, I could hardly believe my eyes. Mr. McCord and I at once commenced digging, and when we laid aside our tools it was morning. The showing where we left off is just as good as where we commenced, and there is no telling how long it will hold out. I have always had great faith in the Virtue, as you are aware, and told my friends there were 'millions in it.' When the mine was closed down 20 years ago, after an uninterrupted season, I was of the opinion that there was plenty of good ore left, and I guess all will coincide with me now." The Virtue mine was discovered by W. H. Rockyfellow in 1862, and was developed on a small scale until 1865, when a company took hold of the property, working it for several years with splendid results. The Virtue Gold Mining Company was the next to operate the property, and, after working five years, during which hundreds of thousands of dollars were taken out, George W. Grayson purchased the property and realized handsome profits for four years, when the mine was closed down, for what reason the public has yet to learn. Six years ago Mr. Grayson decided to open up the property and sent Mr. Buckminister here to superintend it. After pumping out the shaft and accomplishing some development work, he telegraphed the owner that the ore was too low-grade to pay, and Buckminister was ordered to cease operations. Since that time a number of companies undertook to open up the mine, but their backs were not long enough. Growing tired of this kind of work, Mr. Grayson, knowing that the old producer was a reliable property, concluded to operate it again himself, when along came John Longmaid, of Salt Lake City, about a fortnight ago, who stated that he had a purchaser for the property, and a price was agreed upon, the preliminaries arranged and all was in readiness for the transfer, when Mr. Grayson was informed that the sale was off. The owner of the property kept the pumps at work and operated the mine on a small scale while the sale was pending. He was expected to arrive yesterday, but did not get here. Mr. Grayson has not yet heard of the rich strike and a pleasant surprise awaits his arrival.

BROWNTOWN NOTES.—Grant's Pass *Courier*, July 20: Our miners are plodding along in the old groove. July will see the most of our placer men cleaning up and then they, too, will in all probability take to the hills prospecting for quartz and placers also, for there are doubtless many places where parts of the old and higher chambers are still covered deep by the wearing away and slides of the mountains. Krouse and Baldwin have commenced opening on their quartz claim, north extension of the Griffin ledge, and have found some pretty rock. Griffin has bonded his claim to a San Francisco company. This company represents some millions, and it will soon have a crew of men at work developing the lode and putting up a boarding-house. Beig is hard at work slashing the brush over his hydraulic claim. His water is done for this season. Ehman will soon be closing up, as the water will commence to slacken with this warm weather. The Doney family are getting themselves comfortably fixed and are opening their claim for extension work. There are a number of prospectors in the south about the O. and C. line. As there is a quantity of quartz there, good news may come any day. The Snicker Creek miners are hard at work opening new claims and prospecting for new deposits.

UTAH.

THE SCALE FIXED.—Park *Record*, July 22: Supt. R. C. Chambers and the committee appointed by the miners to represent their interests held a consultation Monday last at the Ontario mill office, and thoroughly considered the proposed reduction. The first conference lasted several hours and the committee was well pleased at the candid and social reception met with at the hands of Mr. Chambers. They presented their case in a strong light, and Mr. Chambers made notes and figures on their proposition and told the committee he would figure on them and give an answer in the evening. Another session was held in the evening, and the following scale of wages agreed to: Men receiving $5 were cut to $4; those getting $4.50 to $3.75; blacksmiths were reduced from $4 to $3.50; other $4 men to $3.25; $3.50 men to $3; $3.25 to $2.75; $3 to $2.75; surface men from $2.50 to $2.25, while the board of all men stopping at the mine and mill boarding-houses was reduced from $1 to 90 cents. The cut takes effect from and including the 18th of July. Though no special order has been issued nor anything said to the millmen, the foremen at those works say the matter was adjusted for all, and that, so far as they know, the cut will be universal on the ratio fixed by Mr. Chambers and take effect from the same date. The agreement seems to meet with pretty general approval, though there is of course some kicking, and several men have quit. Their places were immediately filled, and everything is working smoothly and bids fair to continue.

BROMIDE GOLD.—Salt Lake *Mining Journal*, July 26: James Whitney, who is operating in the Henry mountains with George R. Barton, arrived in this city this morning, says the Grand Junction *Star*, carrying with him 55 ounces of gold, the run of the Bromide stamp mill for 10 days. The Bromide mine, which is owned by Messrs. Cannon, Farrell, Bradish, Caswell and Sumner, is producing some very excellent ore this summer. The mill is only a five-stamp. If the facilities were increased, the product would be relatively larger, as there is no question any more that the Bromide is a great producer.

WASHINGTON.

THE METHOW GOLD CAMP.—Okanogan *Outlook*, July 22: Robt. Stokesberry came in Monday from the Methow gold camp, where he had been prospecting for a couple of weeks. He brought a lot of fine-looking free-gold specimens from some ledge he had discovered west of the main camp, on Squaw creek. He has located four claims. The Mountain View and Sunset are located four miles west of the Highland Light, on which a force of men is now at work sinking; and the Fourth of July and Old Reliable are a mile and a half west of the same claim. Mr. Stokesberry has returned with the necessary apparatus to begin sinking on his properties. Jack Summers and Tom Deaver were in from Squaw creek this week after a stock of provisions and mining tools. They are getting ready to sink a shaft on the Lookout mine, and expect to go down 50 feet. This claim is on the main vein and is one of the best showings in camp. Just before coming to town the boys ground up a few pounds of the rock and panned out $60 worth of gold. It took them just two days to pound out the $60. This was a good enough prospect for the boys and they brought their dust to town, exchanged it for silver and bought some tools to commence work with. They report work being pushed on the Highland Light, for which the owners recently refused an offer of $60,000. It is a splendid looking prospect and the owners are not anxious to part with it.

Market Reports.

The Markets.

SAN FRANCISCO, July 27, 1893.

The Copper Market.

Henry R. Merton & Co. of Loodon report the stocks of copper in England and France, and afloat thereto from Chile and Australia, on the 1st of July as follows:

	Range.	Tons.
1891	£55 5s 0d	57,325
1892	44 17 6	56,604
1893	43 10 0	49 955

Prices af the close of June were almost as low as any time during the first half of the year. They were 7s 6d less on the 31st May. This month has witnessed a still further depression. The quotation in London on the 17th was £42 12s 6d for spot lots aod £43 for futures. It is a curious circumstance that supply has comparatively little to do in fixing a value for this metal. By all laws of analogy, the price at the close of June this year, with less thao 50,000 tons in sight for Englaod and France, should have been bigher than a year ago and two years ago, when the quantity in sight was much larger. But the opposite fact is the case, and all ordinary rules of reason are scattered to the winds. The unexpected has agaln happened.

The Metals.

No special changes have developed in the metal market during the week. Copper has been steady. Lead and tio have weakened. The latter shows the greatest variation for the week.

Mining Share Market.

There is very little doiog on Pine street in these days. The Comstock mines furnish the bulk of the business and just now there is douht as to what will be the outcome of the move to reduce the expenses up there and in the city offices. It is stated that the railroad and the water people have agreed to cut down their charges, and the wood people, whose profits are small, have agreed to reduce as much to the mining compaoies as the railroad will redoce to them. The way the matter now stands, it depends upon the Miners' Union to meet all the other interests. The Miners' Union will hold a meeting at Virginia City to-night (Thursday) and will take formal action. The officers in this city have already agreed to accept a reduction of salaries. If the whole plan is carried out, affairs on the great lode will doubtless be improved, but if the Miners' Union holds out for present wages, some of the mines will probahly he closed.

The move of the S. F. Stock Board to increase its business by listing gold properties without charging any fee except the anoual dues is quite an important event on Pine street. Only one company has accepted the offer, and that is a drift-mining company of the Forest Hill Divide, Placer county. It is the Mayflower, quite a famous rich mine of this class. We have referred to this subject in another column.

At the annual meeting of the stockholders of the Lady Washington Mining Company 95,000 shares were represented and the following officers elected for the ensuing year: R. E. Kelly, president; Herman Zadig, vice-president, and E. B. Goodrich, George H. Pippy and Josepb McBoyle, directors. J. E. Jacobus was elected secretary, and the financial statement showed a credit of $827.13.

At the aonual meeting of the stockholders of the Savage Mining Company 91,470 shares were represeoted aod the following officers elected for the ensuing year: George R. Wells, president; Charles H. Fish, vice-president, and Thomas Anderson, William S. Wood aod Herman Zadig, directors. E. B. Holmes was re-elected secretary, and R. C. Keating, superintendent. The secretary's financial statement showed an overdraft of $8022.28. The superintendent's report showed that during the year they have extracted from the various levels of the mine 18,372½ tons of ore, which has been reduced at the Nevada mill. The gross bullon yield of all the ore milled was $282,379.39; discount on same, $75,341.27; net coin received, $207,038.12. The average car-sample assay of all the ore milled was $23.38; the average battery assay, $20.85; the percentage obtained per ton, $77.37.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

The following brief list by telegraph, for July 25th, will appear more complete on receipt of mail advices:

California—David L. Albert, Fort Bragg, mechanical calculating device; Walter F. Burns, San Francisco, automatic weighing and recording-scale; Benjamin Field and E. P. Clark, Los Angeles, feed water-heater and purifier; Andrew Fraeier, San Francisco, ore-cruehing machine; Frederick H. Hanseman, San Francisco, water gauge; George E. Hoyt, San Francieco, gas engine; Milee J. Nigbtingale and J. B. Stearns, Oakdale, seed sower; Edwin R. Thomson, San Francisco, apparatus for reducing bituminous rock; Sarah S. Freeman, Los Angeles, dressmakers' rule; Wertheimer Company, San Francieco, three patents for cigars.

Oregon—David Craig, Macleay, hop trellis; Clark R. Long and C. H. Kline, Haisey, steam cooker.

Arizona—Andrew Knudeon, Tucson, combination tool.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. to the shortest time possible (by mail for telegraphic order). American aod Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained throngh Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EXCAVATOR.—Henry P. Bennett, Phœnix, A. T. No. 501,400. Dated July 11, 1893. The invention relates to that class of excavating or ditching mschines in which a rotating wheel, provided with a series of elevating buckets, receives the material from a plow below and delivers it above to a vibratory discharge shovel which throws it to one side. The present invention is an improvement upon that excavating and ditching machine for which the same inventor made previous application. It consists in a novel controlling apron hetween the vibrating shovel and the discharge hopper to which the hnckets successively deliver the material. It also consists in making the shovel perforated and in the novel constrnction and arrangement of the means for vihrating the shovel.

GEAR CONNECTION FOR PLATFORM SPRINGS.—Joseph P. Farrell, S. F., assignor to O'Brien & Sons. No. 501,411. Dated Jnly 11, 1893. This relates to that class of spring gears for vehicles in which the springs are of the platform pattern and their adjacent ends are united hy means of shackles. The invention covers a novel constrnction of the ends of the springs and in connection therewith of a novel shackle connection. The object is to make an easy-riding spring which will not snap or hreak like a rigidly connected spring and which will neither work loose nor rattle and will he durahle.

Liberal Offer to Miners.

The Colliery Engineer Company, Scranton, Pa., advertises in another column that they will present free of charge, postage paid, a copy of the fifth edition of The Coal and Metal Miners' Pocket-Book, price $2, just issued, to every person who will send them the names of at least ten mine officers or miners in either coal or metal mines, as soon as one person on the list subscribes for *The Colliery Engineer*. This is a very liberal offer, as the new edition of their Pocket-Book is a work which should be in the hands of every miner, mine official and student of mining. It contains 600 pages of memoranda and tables relating to coal and metal mining, and is the most complete technical pocket memoranda of the mining industry published.

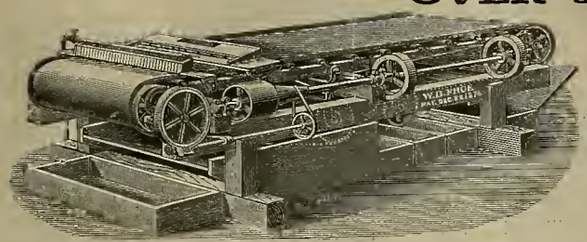
FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891,



GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

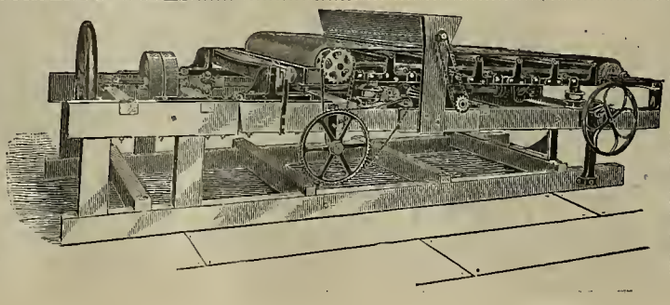
{ PATENTED } { May 5th, 1893. } **CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE.** { FRANK BARRERE, } { Secretary. }

CAN BE SEEN IN OPERATION AT THE COMPANY'S WORKS.....132 MAIN STREET, SAN FRANCISCO, CAL.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, Ioo, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. McGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works

Working Drift Mines.

Mr. Ross E. Browne estimates that the yield of the Forest Hill Divide district has been about $30,000,000 in gold. The richest drifting channel on the divide was, doubtless, the Forest Hill channel, or series of parallel, narrow courses under the town of Forest Hill, which, according to hearsay, yielded by drifting an average exceeding $1000 per running foot.

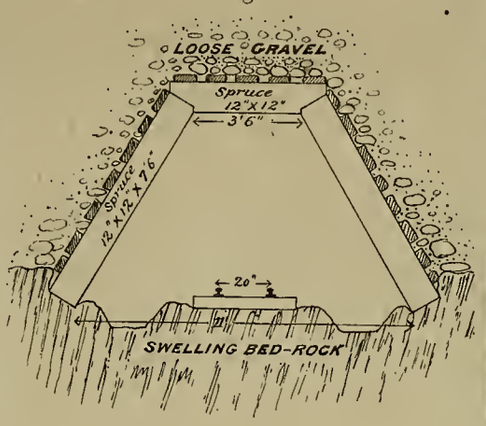
Many of the ancient channels and benches, especially those of the earlier period, have been exposed in complete cross-section by the erosion of the modern streams. For some time after the first discovery, in 1851, the mining of the district was practically confined to these exposed sections. The methods were naturally ground sluicing, hydraulicking and drifting direct upon the rich layers. The drifting extended farther into the hill, and deeper tunnels were driven to drain off the water and facilitate the delivery of the gravel.

The exposed and easily accessible deposits were gradually exhausted, and bolder enterprises were started. Shafts were sunk through the volcanic cap and a deeper system of channels discovered. Large quantities of water were encountered, and this method of attack was found too expensive. At the present time all of the important mines of the divide are worked through deep drain and tramway tunnels, driven at great expense through the bedrock. Upraises to the channel bottom are made at intervals, and the richer gravel extracted. According to the firmness of the cementing substance binding the pebbles together, the gravel is either washed through sluices or crushed in a stamp mill.

The tunnels are driven either by hand or machine drills. By hand drilling the progress is from forty to seventy feet per month, and the expense $6 to $10 per running foot. By machine drilling the progress is from one hundred and fifty to three hundred feet per month, and the expense $12 to $18 per running foot.

The Hidden Treasure was discovered in 1875, by Mr. William Cameron. This discovery is noteworthy, as the channel was not exposed anywhere near the point of attack, having been cut away by a volcanic gravel channel. Mr. Cameron based his calculations upon the similarity of the deposits at the Mountain Gate mine and at Gas Hill, and started a tunnel, which passed through six hundred feet of volcanic gravel, and struck the white channel at precisely the right elevation. The pay channel is wide and the gravel loose and free-washing. The channel is reached through 600 feet of tunnel in volcanic conglomerate. The tunnel follows the channel up stream and is partly in gravel, partly in bedrock. The length of the tunnel from surface to gravel breast is 8500 feet. The gravel is breasted by picking and caving, and is shoveled into cars having a capacity of one ton each. These cars are pushed by hand through short gangways to the main tunnel and thence run by gravity to the dump-house on the surface. One horse hauls a train of 11 empty cars into the mine.

Fig. 14.



The pressure from the gravel is not great, but the swelling bedrock has been a source of trouble, driving the legs of the timber set inward and crushing the cap. After many unsuccessful attempts to overcome this difficulty, the legs were given an increasingly greater bottom-spread, until finally it was found that they remained stationary. The swelling bedrock is removed from time to time and the track adjusted. The accompanying cut shows the form of tunnel timber-set now used in bad swelling ground. (See Fig. 14.)

Sets are first put in four feet apart, and in the course of a few months center-sets are placed between these. Timber-sets on this plan have now been in place three years, and are still in good condition. In the 8500 feet length of tunnel, there are about 4000 sets of timbers. Two men are kept constantly employed in easing and repairing the sets and adjusting the track.

In breasting the loose gravel the ground is timbered closely, as shown in sketch (Fig. 15). The excavation is partly filled in or walled up with large bowlders to prevent extensive caving.

Fig. 15.

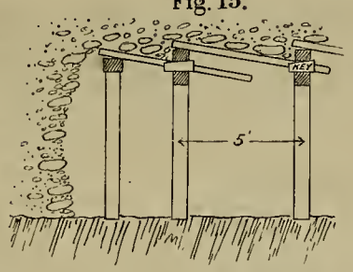


Fig. 16.

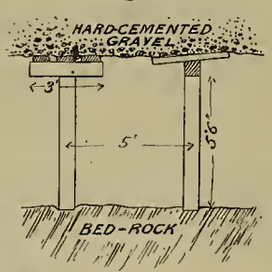

METHODS OF TIMBERING IN DRIFT MINES.

The Mayflower was discovered by Mr. F. Chappelet, and he was for a long time its superintendent, but is now the president of the company. The gravel is hard and cemented, involving the use of a large quantity of powder in breaking and a small expense in timbering. It requires milling. The gravel-breasting is carried on by drilling single-handed; blasting with No. 2 dynamite powder; timbering with short caps and posts five or six feet apart. (See Fig. 16.) Excavation in great part is filled in with bowlders. A gravel breast, 75 feet wide and 6 feet high, is driven ahead along the length of the channel at the rate of 80 to 90 feet per month, and there are required two such breasts to keep the 20-stamp mill running at full capacity. Prospect drifts, in gravel, cost $2.50 to $3 per foot length.

TABLE OF CONTENTS.

EDITORIALS.—Working Drift Mines, 81. Comment; Comstock Miners' Wages, 82. Milling Auriferous Gravel; Gold-Saving Appliances, 83.

ILLUSTRATIONS.—Methods of Timbering in Drift Mines; Dodge's Distributor; Dodge's Sizing Boxes, 81.

MISCELLANEOUS.—The West Kootenay Mining Region; Mineral Wax; The Economic Side of Electric Railways, 85. The World's Gold and Silver; Gold Yield of New South Wales; Geology of Building Stones; Cornish Mines and the Royalties They Pay; Can Destroy Logging Streams, 86. Foundry Notes; Coast Industrial Notes, 88. English Mineral Statistics for 1892, 84.

MECHANICAL PROGRESS.—An Important Armor-Plate Test; A Steel 150-ton Pillar Crane; The New Army Rifle; A Large Girder, 88.

SCIENTIFIC PROGRESS.—Velocity of the Transmission of the Flame of Firedamp; Iridescent Photographs; The Bed of the Atlantic, 88.

ELECTRICITY.—Electricity in Agriculture; Electric Motors for Steam Roads; Electric Railways and Turnpike Companies; Electric Signal Lights, 90.

USEFUL INFORMATION.—Weight per Square Foot of Sheet Metal; What Zero Means; Paving Alleyways; Tropical Roofs; Steam and Electric Railroads, 90. What the World's Fair Buildings Are Covered With; A Unique Way to Save Rails; New Sclerometric Method; Fastening Emery Paper on Wooden Disks; To Draw Red Lines on Blue Prints, 91.

CORRESPONDENCE.—Pine Creek Mines, Oregon; Pocket Mining; Prospectors' Prices for Claims, 84.

Comment.

An improved plan for operating the MacArthur-Forrest cyanide process has been devised by Almarin B. Paul of Shasta county, whereby all wet-crushing stamp mills or other wet-reducing machinery working gold ores can be utilized and worked as usual. The plan allows the taking up of the coarser gold first; then comes the cyanide treatment. The plan does away with all banking or rehandling of tailings, and without the loss of any of the slimes of the "muddy water." It is said to be very practical and inexpensive, and makes quite a saving of time in the treatment. Moreover, ores can be worked to a higher percentage. Mr. Paul was the first to introduce the process in California, and has had a great deal of experience with it. He has built several mills for operating it, and is doubtless the best-posted man on the practical working of the process this side of South Africa, where 27 mills are using it with great success.

Shasta county, from the earliest days, has been a great gold-producer, and up to the period of the stoppage of hydraulic mining there was a large yield of gold from the gulches and placers. In pioneer days Shasta was especially famous for its large output of gold. There are at this time, in various localities of the county, thousands of acres of gold-bearing ground that would be a paying proposition if water for washing were available. As it is, during the winter and when the heaviest rains are on, hundreds of miners turn out and get large rewards for their labor. Of late years, however, attention has been largely given to the development of the quartz interest. As a quartz county its future is very promising. Minerals of every variety are to be found in special localities, gold, silver, copper and iron being the most abundant. The principal outlay of capital and labor has of late been given to the development of the gold-bearing lodes.

The sale of the Harqua Hala gold mines of Arizona to a London syndicate for one and a quarter million dollars proves that our British cousins will invest in gold properties outside of South Africa if they can be shown a good thing. These mines have proven themselves good producers already, and, with improved facilities furnished by capital, ought to do even better in the future. This sale will stimulate other mine-owners to put their properties before foreign purchasers. The largest sale made recently in this State was to a French company who purchased a hydraulic mine in Trinity county, and are examining other properties in the same region. It is greatly to be hoped that these ventures will prove profitable to the investors. There are plenty of good mines on this coast which should attract capital from abroad.

The depression in the mining industry all over the world extends even to diamond mining. The price of shares in the De Beers Consolidated Diamond Mining Co. operating the Kimberley mines, South Africa, have fallen in value about 20 per cent in the last month or so. This company practically controls the diamond markets of the world and restricts the production. However, its product being entirely an article of luxury, the demand does not now come up even to the restricted production; hence the fall in value of shares. One of the curiosities of the present condition of affairs in mining is that the shares of gold-mining properties have fallen almost as much as those of silver mines, and this in the face of a greatly increased and marked demand for gold properties. This is especially noticeable in Colorado. It is probably due to the fact that people who have money are holding on to it, and there is a scarcity of investors. The holders of the stocks need money and are willing to sell, and there being slight demand, prices fall accordingly.

It has been satisfactorily (or unsatisfactorily) proven that one big wheel will not serve as good a purpose as half a dozen smaller ones in river-bed mining operations. An Oregon engineer devised one for the American Bar claim on the Klamath river below Hornbrook, in Siskiyou county, this State, which was 43 feet wide and 18 feet in diameter. It was built with a view to operating all the apparatus, instead of having a wheel for each purpose, as in other claims. When turned loose it took half a turn or so and then its remnants began to scatter all along the river. The main shaft, made of wood, was not strong enough for the purpose. The miners owning the claim will now fall back on the regular old-fashioned size of wheel and drop any projects which might rival Ferris of Chicago.

The miners and other employes of the Vancouver Coal Company, at Nanaimo, B. C., have been asked to accept a reduction of wages ranging from 20 per cent for miners to from 10 to 20 per cent for others in and about the colliery. A mass meeting was held on Tuesday and a prolonged discussion ensued. Many present were in favor of the mines being closed rather than accept a reduction. It was finally decided to appoint a committee of five to wait upon the superintendent of the company and lay before him a proposition that the miners will agree to accept a reduction of 10 per cent providing the wages of all other underground laborers remain as at present, and that a written guaranty be given that when the market improves wages will be raised to the present standard. The miners' proposition to accept a 10 per cent reduction was refused. The management insist upon a 20 per cent reduction on all men making more than $3 per day and 10 per cent on those earning less. On Wednesday another meeting was held and the miners submitted their proposition to the effect that they would meet the management half way. The miners will accept a reduction of 10 per cent and other underground workers five per cent. The committee laid the proposition before the management. It is believed the management rejected the proposition issued as an ultimatum. The miners have all along met the company in a friendly spirit and shown anxiety to help them in their present difficulties, but are unquestionably determined not to accept a reduction of 20 per cent, which is considered excessive.

One would suppose from the recently framed memorial to Congress of the Anti-Debris Association that the hydraulic miners had asked for the removal of all barriers to that class of mining and the unconditional repeal of the Caminetti law. The fact is, however, that the miners have not yet asked for anything whatever; have made no petition to Congress to repeal the law; and have no expectation that they will ever again be permitted to hydraulic except behind dams. The Anti-Debris Association reassert their opposition to dams, though the Government engineers recommend them. The association says in its memorial: "We do not believe that dams can be erected that will protect us from injury." As the courts have given permission to the biggest mine in the State to mine behind a dam, and the engineers will see them put at all the mines asking for a license, this "belief" of a lot of farmers along the river will have no weight at all. The miners will try and make some arrangement by which the dams will be built for them, and then pay for them out of the yield of the mines. They want to work their properties and keep the debris out of the rivers behind dams; but the anti-debris people do not want these mines worked, dams or no dams. But the gold is wanted just now and it is safe to say those mines will eventually be worked one way or another.

John F. Kidder of Nevada county, superintendent of the Nevada county narrow-gauge railroad, has been appointed Debris Commissioner by Governor Markham. This is a new office created by the last Legislature and is to continue for four years. The duty of the commissioner will be to consult and advise with the Board of Engineers of the United States, who have been appointed with power to adopt plans and specifications for the construction of works for the impounding of mining debris. The Debris Commissioner is required to examine and pass upon the merits of such works and to determine whether or not such works are calculated to and will protect the navigable waters of the State, and to keep a record of such determinations. The Legislature appropriated, out of the general fund of the State treasury, $250,000—no warrant against said sum to be drawn or paid until the United States Government shall have appropriated at least an equal amount—to be used in the construction of the works for the impounding of the mining debris. Mr. Kidder is a civil engineer of acknowledged ability. His many friends are confident of his fitness for the new position, and the appointment is specially pleasing to the residents of Nevada county—the leading gravel mining county of the State.

Comstock Miners' Wages.

The miners on the Comstock do not take kindly to the proposition to reduce their wages 25 per cent, as proposed by the mine-owners and managers. They say that this percentage of cut in the salaries of the officials does not particularly affect them, but the same cut in the daily wages of the miner is something serious. It is claimed that the miners' wages form only one-sixtieth per cent of the cost of operating Comstock mines. The cost of transportation, wood, water, milling, etc., have always been excessive, as have also been the office salary lists. In the opinion of the miners, with expenses suitably reduced in these directions the miners' wages could be maintained as at present. The Miners' Union has been considering the proposition, but has arrived at no definite conclusion as yet. The amount claimed to be in the treasury of the Union is $50,000, with $10,000 promised from the unions of San Francisco, and also quite a sum from Butte City, Montana, which on a former occasion was aided by the Virginia Miners' Union. As they are figuring on their resources, it looks as if there would be vigorous protest on the part of the union.

The miners themselves know all about the mill operations and the salaries paid for useless officials. They know of many instances where the mine loses thousands by milling ore on which the mill makes thousands. They know where there are dozens of officers to one or two miners in the cases of a number of companies. It is natural for them to think that if the mines were honestly managed, there would be no need of a reduction of wages. The officials have already accepted the proposed reduction, but this is a "forced put," because people are objecting to paying assessments. The delinquent list of the Hale & Norcross mine advertised this week occupies four columns of a daily paper. The holders of the stock decline to pay, and give up their stock in preference. This is not confined to this mine, but applies to many others. If assessments cannot be collected, the mines cannot be worked. The only wonder is that this point has not been reached long ago, so barefaced have been the methods of management of many of these properties.

Of course it is in the power of the directors of the companies to temporarily close the mines if the miners refuse the proposed reduction. But there will be many more than the miners out of a job if this is done, and the mines will only be closed as a last resort. As to the views of individual miners on the proposed reduction, the following may be quoted:

One member of the union who was interviewed said: "Our meetings are secret and I can give nothing official. You may say that it will be a big surprise if the miners accept any reduction. Our wages are none too large. We don't propose to sweat in the sweltering drifts and inhale the poisonous gases for less than $4, while men are loafing in San Francisco and drawing fat salaries as superintendents and secretaries of a dozen different companies. We have enough money in our treasury to run us a long time and none of our members out of employment will suffer. Don't believe a word of the talk about putting 1000 men to work at $3. It is all bosh. If the mine-owners meant business they would put their proposition in black and white."

Another miner said: "Begin economy with the mill and we are all on to the racket. Why, not long ago a mine here lost $2000 a month, and the mill that crushed the ore made about $5000 on it. The mill sump-hole takes the money out of the mining industry, and when the mills cheapen, as they can, and still make a profit, there will be no need of a reduction in wages. Let an outsider go down to those heated levels and see if he thinks $4 too large, and aside from that, under economical management and cheap milling, there need be no cut in wages."

The miner asserted that the reports of low-grade ore were misleading. "Why," he said, "I saw ore in a drift

not long ago which assayed $280 a ton, and the car samples of that same ore were reported at $19. The game has been played a long time, and covers up a great deal of crooked work."

Milling Auriferous Gravel.

The milling of auriferous gravel or conglomerate, as carried on at Witwatersrand, South Africa, does not differ very materially from what we do with such gravel in this State. The African conglomerates are quite hard and are more after the fashion of quartz mines, lying as they do in inclined beds. They are then milled in ordinary gold-mills, but the cyanide process is extensively used.

In the drift mines of California only the lower stratum of auriferous gravel is breasted out. Sometimes this is "free-washing" and is sluiced, not requiring milling. A good deal of it, however, is so firmly cemented that it must be crushed in mills just as ore is. The mills used for this purpose crush from 6 to 6.5 tons of gravel for each stamp for 24 hours. By water power this milling costs about 25 cents per ton. By steam it costs from 35 to 50 cents per ton. The gravel of the famous Mayflower drift mine, on the Forest Hill Divide, is hard and cemented.

The gravel is crushed in a 20-stamp mill located at mouth of tunnel. Four batteries of five stamps each. Stamp, 850 pounds; 7½ inches drop; 100 drops per minute. To each battery there is an automatic feeder (Challege), a grooved wooden table, an oscillating rubber (Eureka), and a box of riffles. For screens, punched iron plates are used, two-tenths inch holes, six or seven holes to the square inch.

The mill is run by steam power in the summer and fall, and by water power in the winter and spring. There are provided for this purpose one boiler, 48 inches by 16 feet; one engine of 75 horse power; one five-foot Pelton water-wheel. Amalgamating plates have been discarded. The horizontal grooves across the table are 1½ inches wide, three-fourths of an inch deep, and about 20 inches apart. The mortars and grooves are charged with quicksilver.

The gravel, as it enters the feeders, is picked over by two assorters, who throw out the large clean pebbles and bowlders. About nine per cent of the mass is assorted out in this way and is washed down the sluices without passing through the mill. The tailings pass through 800 feet of sluice boxes. Most of the gold is collected in the mortar and upper groove.

At the Paragon (or Breed & Wheeler) mine, in the same district, they have ten stamps. In place of a punched plate they use a coarse wire screen with 25 openings to the square inch. The mill runs 12 hours per day, putting through 30 tons of gravel in that time, by steam power. They clean up the two upper grooves daily, the mortar weekly, the rubber two or three times a year and the sluices once or twice a year.

Gold-Saving Appliances.

Figs. 1 and 2 on page 81 show the elevation and section of the Dodge machine that divides equally the sand or pulp and water as they come from the battery on the way to the concentrators. In cases where a battery feeds two or more concentrators, adjustable diffusing guides are employed, but these cannot be relied upon, because, by clogging, one concentrator may be supplied with sand and another with water, but with the present machines the pulp is swept over gratings or perforations in the bottom of the revolving pan, uniformly mixed, and is then cut out by dividing plates or diaphragms, one of which is seen in front, and is thus separated into two or more equal parts of sand and water that flow out of sponts at the bottom and to different concentrators. In this manner concentration is equalized and uniform, producing better work and an increase of capacity. One of these machines will take the pulp from a ten-stamp battery or No. 1 pulverizer. It weighs 520 pounds.

Figs. 3 and 4 show Dodge's improved sizing box, which by hydraulic selection discharges the fine material at the wide spout at the top and the coarser material at the bottom. It is a refinement, so to speak, on former appliances for the same purposes. Two sizes of these boxes are made, No. 1 being suitable for 10 stamps and No. 2 for 5 stamps. No. 1 weighs 370 pounds. No. 2 weighs 210 pounds. The Parke & Lacy Co. of this city are agents for these machines.

J. H. CROSSMAN, the old California miner, is lying at the Baldwin Hotel, physically in bad shape. He was brought in on a stretcher, and has been suffering considerable pain, but is better now. A few days ago, just after examining a group of mines near French Gulch, Shasta county, his horse ran away, while coming down the mountain grade. He and J. H. Riddle, who was with him, were thrown out. Both were badly bruised, and Riddle had three ribs broken. Mr. Crossman had his hip dislocated.

Foundry Notes.

Business is exceedingly dull among the iron works in this city at present. None of the shops are running full-handed and large orders are scarce. This, however, is nothing more than might be expected during the present stagnation of general business and the prevailing scarcity of money. Few new enterprises are being inaugurated just now which call for engines or other machinery, nor is much improvement expected in this direction until money matters are on a better basis than is the case now.

The steamship Umatilla of the Pacific Coast S. S. Co. has just been equipped with a refrigerating plant, including a Vulcan refrigerating and ice machine, by the Vulcan Iron Works of this city. This plant is intended to keep a number of cold-storage rooms down to the proper temperature for the transportation of fruit, fish and other perishable food produce, and has proved a great success in every particular. This plant has proved a great convenience, owing to its doing away with the necessity of handling and carrying ice, and it has also been found to be a source of considerable profit as the shippers of such material as requires cold storage are willing to pay an extra price for the privilege of having their materials carried in cold-storage rooms.

A Vulcan refrigerating and ice plant has just been installed in the State Asylum for Insane at Agnews, Cal. This plant has recently been started in operation and is giving great satisfaction to the directors of the asylum.

An attempt is being made in Los Angeles to collect money to build and start a rolling-mill plant in that city.

The first steel steam-yacht ever built on the Pacific coast will be launched from the shipyard of the Union Iron Works to-day. The yacht has been strongly built and very handsomely finished and furnished. She is owned by E. W. Hopkins, the capitalist, of this city. She is built of steel and is finished mostly in teak and primavera. The vessel was built entirely for pleasure and is as comfortable as possible. El Primero will have a speed of about 15 miles an hour. Her engines are triple expansion of 225 horse-power. Roberts' coil boilers are used. The dimensions are as follows: Length over all 137 feet; tonnage length, 120; registered length 111.5; beam, 18; depth, 8.7; draft, 4.2; registered tonnage, gross, 102.99 tons; net, 73.48; displacement, 70 tons. The steamer will draw but four feet of water ordinarily at the bow and less than five at the stern. The cost of the new yacht was $35,000. She will be manned by a crew of six. The deck of El Primero is flush fore and aft, with the exception of a house about the foremast. In this is a pilot-house and a dining-saloon. The after part of the deck will be covered with a canvas canopy. The bulwarks are composed of a rail of teak, steel stanchions, with rope lacings between. The new vessel will fly the flag of the San Francisco Yacht Club, and will shortly start for a cruise to Alaskan waters.

The Lisbon Reclamation District on the Sacramento river has made a contract with the San Francisco Tool Co. for a very extensive pumping plant. There are two 30-inch centrifugal pumps. The two engines which are directly attached are triple expansion with cylinders 8, 12 and 22 inches and 16-inch stroke. There are also two Babcock and Wilcox boilers and two vertical direct-acting air pumps. The engines are to be arranged to work either pump as required. With the plant are two duplex feed pumps and two Gonhert patent water-tube feed-water heaters. The suction and discharge pipes for the pumps are 36-inch internal diameter. The estimated capacity of the whole plant is 60,000 gallons per minute against a 20-foot head. The Tool Co. set up the plant, on concrete foundations, ready for work.

The City Trustees of Sacramento have awarded to A. L. Fish of San Francisco a contract to furnish Sacramento city with water, to be pumped from wells which will be dug in the suburbs. The contract provides the first 1,000,000 gallons be furnished the city at 3.9 cents per 1000 gallons and the second 1,000,000 gallons at 2 cents per 1000. At the end of five years the plant is to be turned over to the city. Before the contract can go into effect the water proposition will have to be first voted upon favorably by the people, which no doubt will be done. Worthington steam pumps are to be used.

The Pacific Rolling Mill of this city, which annually employs an average of 870 men, now has only 200 men at work. There is very little doing in the rolling-mill business at this time, but the company do not want their men to leave and scatter, so keep a small force at work.

Coast Industrial Notes.

THE Trustees of Haywards have decided to issue $33,000 worth of bonds to build a sewer system.

THE value of the money and bullion in the vaults of the San Francisco Mint is $57,997,504.

FIFTEEN or twenty men are at work in the White Horse district, near Wadsworth, Nev.

THE meat-packing house of Mohr & Yoerk, on the outskirts of Sacramento, was destroyed by fire on Monday; loss $20,000.

NEARLY all the mills on the Truckee river have a large supply of lumber on hand, for which there is a very dull market at present.

THERE are 32 vessels in port chartered for grain, with a total carrying capacity of 102,900 tons. The disengaged list consists of 23 vessels.

AN election will be held at Riverside September 12th to provide for the issuance of bonds for $250,000 to build a Hall of Records, County Hospital, new roads, etc.

THE San Antonio Water Company voted last week to issue $350,000 in bonds for the improvement of the irrigation system of Ontario and purchase additional water.

ARTICLES of incoporation have been filed on behalf of the Bear Harbor Lumber Company. Directors—Calvin Stewart, Edward J. Dodge, Thomas Pollard, James Hunter, Aaron B. Cooper. The capital stock of the company is placed at $200,000, of which $80,000 has been actually subscribed.

A CORPS of surveyors is on the headwaters of the North Yuba river figuring on the probabilities and costs of flumming the water down to the plains for irrigation purposes. A number of capitalists are behind the scheme.

THE Board of Directors of the San Jacinto and Pleasant valley irrigation district have issued a call for a special election to be held in August next to decide upon the proposition to levy an assessment of $3000 to meet the current expenses of the district.

GRAY BROTHERS, who have an agreement to grade and remove the sand from Lobos square, as well as a large number of blocks owned by private parties, have commenced on the work. Tracks are being laid on Francisco street for the operation of the sandcars.

Two different companies from Salt Lake are constructing ditches from the Mardis mountains to the placers on the Bruneau river, with the intention of hydraulic mining. These mines are in the northern portion of Elko county, Nev., and embrace several thousand acres that pay from the grass roots.

THE trustees of the California State Mining Bureau have re-elected Jacob Z Davis president, W. S. Keyes vice-president and Henry S. Durden secretary. R. L. Ogden has been made librarian vice C. Robinson, resigned. The lease of the rooms now occupied by the Bureau in the Pioneer building was extended for two years more.

IT is announced that Aspen, Colorado, mine-managers have drawn up an agreement in which the signers agree to work for $1 cash a day and board and a due bill for $2, to be paid when the ore can be disposed of at a reasonable profit. A large number of miners are accepting the conditions and several of the mines will resume in a short time.

THE building associations of the State have been assessed 1½ cents on each $200 share, and proportionately for shares of greater or less par value, to defray the expenses incident to the office of commissioner of loan associations. The two commissioners who are now at work are A Fisher of this city and William A. Spalding of Los Angeles.

THE Crown Point mine in Gold Hill, Nev., started up Tuesday morning with one full shift of men. They will be employed in getting out the gold rock on which a test run was recently made at the Mexican mill. It is probable a night shift will be put on before long to get out the same class of ore, and the mine will work two shifts for some time to come.

THE Oakland city assessment valuations this year will amount to about $43,288,175, exclusive of assessments on steam railroads. The assessment last year, including the railroads, amounted to $44,250,000. That shows that there will not be much of an increase in the tax on city property. The Alameda county assessor did not raise the valuation on city property at all. His increase was on improvements entirely.

AN order was received at Mare Island Navy Yard on Monday authorizing an increase in the forces. It is understood that additional forces will be put on the Monadnock and that her completion will be pushed with all dispatch. From the same source it is ascertained that fully 300 additional men will be put on at the navy yard within the present year and more if found necessary to complete the work already under way.

THE Shasta Land and Development Company has been incorporated in Oakland for the purpose of buying and selling real estate, to sink or bore wells for oil, coal and gas, etc. The capital stock is $10,000,000, divided into 100,000 shares, of the par value of $100 each. The directors are: W. G. Henshaw, Samuel D. Prather, W. J. Mathews, C. B. Gould and Thomas Prather. Each of the directors has subscribed the sum of $500.

TWENTY-SEVEN canneries are packing salmon on the Fraser this year and 1325 boats are at work. Sockeye salmon, which is the only variety packed in quantities, are running now in immense numbers, the average taken by steady fishermen being 1000 for 12 hours. The run has never been better than at present and the canneries cannot get away with the quantities of fish supplied them, though some of them are packing 1500 cases daily.

A NEW enterprise at Woodland is the Woodland Manufacturing Company, which has established a plant for the manufacture of the rotary chopping-bowl, having purchased the right for eleven Pacific coast States and Territories. Woodland has granted the company the free use of the upper stories of the new water works buildings. The directors of the new enterprise are: W. E. Ellis, president; C. T. Bidwell, secretary; R. H. Beamer, N. M. Weaver and M. D. Chamberlin.

A MEETING of the Pacific Underground Electric Railway Company was held at 319 Pine street on Saturday, and officers were elected as follows: President, John F. Burgin; vice-president, J. J. Scrivner; treasurer, A. Craig; secretary, D. B. Richards; business manager, F. S. Chadbourne. This is the company which recently took out articles of incorporation for the sake of retaining possession of patents which they have acquired and which they intend to hold until opportunity offers for utilizing them in this vicinity.

IN Sonoma county there are 832 vineyards aggregating 23,291½ acres, of which 21,908½ acres are in bearing. Of these 21 618 acres are planted in wine grapes, 2328½ acres being on resistant stocks. Only 801 acres are affected by phylloxera. The crop of 1892 amounted to 48,409 tons of grapes. To store this there has been made a cooperage of 5,676,300 gallons, 2 595,000 being of oak and 5,081,300 gallons being redwood. These figures refer not to the

product of the vines but the total capacity of the different wine cellars.

DURING the fiscal year ending June 30th, the customs receipts at San Diego aggregated over $93,000, the value of imports beiog $420,000, while nearly $100,000 worth of exports were made. Two hundred and ninety-six vessels were entered from foreign and domestic ports during the year, nearly two-thirds beiog from foreign ports. The business done during the year as shown by the Custom-house reports was nearly as great for San Diego alone as for the entire customs collections of the district of Los Aogeles. which included the city of Los Angeles and ports of San Pedro, Redondo, Port Angeles aod Santa Barbara.

THE Chino beet-sugar factory, one of the largest in the United States, with a maximum reducing capacity of 740 tons of beets per day, started up Monday morning. This industry gives direct employment to 2000 men in Chino, to several hundred at Aoaheim, and iodirectly to many more, and will furnish an impetus to many branches of trade in the State. The crop of the Chino ranch is better than ever and is estimated at 50,000 tons. The crop to be shipped from Anaheim will reach 10,000 tons. The factory ruos day and night through the season, reducing an average of 600 tons of beets daily. The acreage of beets on the Chino ranch is 4000; at Anaheim 1000. The output for the season will be 16,000,000 pouods of refined sugar.

DURING the month of July local corporations disbursed dividends as follows: Commercial banks, $567,500; gas companies, $73,500; water companies, $74,500; insurance companies, $41,000; powder companies, $12,000; street-railroad companies, $10,000; mining companies, $67,700, aod miscellaneons companies, $1200. The total amount of these disbursements is $847,400, agaiost $1,113,600 for the corresponding mooth io 1892. The decrease is due to the cessation of dividends by certain mining companies, owing to the heavy deolioe in silver. In addition to the payments for July last, which are recorded above, the local savings banks disbursed a total of about $2,000,000 in dividends, making a graod total of $2,847,400 paid in that month.

THERE are at present 29 banking institutions actively engaged in business in San Francisco. The list includes 16 commercial banks, 11 savings banks, and two national banks. There were 27 banks in business in the city on July 1, 1892, and there have beeo four additions to the list during the year. The new banks are Sisson, Crocker & Co., which began business July 11, 1892, and Columbian Banking Company, Columbus Saviogs and Loan Society, aod Union Savings Bank and Trust Company, the latter three having commenced operatioos since the beginniog of the present year. There are two banks in a state of suspense, the Pacific Bank and the People's Home Savings Bank, which are not included in the 29 baoks of the city.

THE Navarro Mill Company of Meodocino county has called a meeting of its creditors. The reason this step has been taken is the incapacity of the company to continue business under existing circumstaoces. The call was a voluotary one on the part of the company, as it saw no way of meeting drafts made upon it. The banks have declined to advance mooey as they have done hitherto, hence the wisest step has been taken to arrest the accumulation of debts. The liabilities are about $500,000, but the assets are $1,000,000. The company is one of the oldest in the State and its mill is the largest, having been built and started up in the year 1860, or 33 years ago. The mill is most completely equipped, an entirely new and modern saw plant having been put in as recently as two years ago. The average quantity of lumber cut a day at these mills is 110,000 feet. The number of employes has never been less thao 500 for the past 15 years, and in busy times 1000 hands have been employed. Tuesday the mills were shut down, aod the 500 men are now out of employment. The lumber business has been very bad.

THE condition of the fruit-canning aod drying industries remains practically unchanged. Of about 25 canneries in this State possibly 10 are in operation, and these at one-half or less than that proportion of their full capacity. Many of the packers are simply filling a few orders which they have received and their operations are but nominal. Of about 50 fruit-drying establishments in the State, less than one-half are ruoning, and these at far below their capacity. There is a large crop of the finest fruit in the world, but the general financial depression, which seems to affect the commercial world in periodical waves, has caused a stagnation which has included in its baneful iofluence the great fruit industry of California. The conservatism of the banks in declining to loan money to the growers aod packers with the liberality of previous years is not alone the cause of the ioactivity of the canneries. There has been a falling off in the demand for the fruit caused by the financial depression in other parts of the world. The loss to the laboring classes is apparent when such a house as the Cutting Packing Company, which formerly had a payroll of $5000 a week during the season, is now payiog oot to exceed $6000 a month for labor and only ruoning two of its three canneries aod those on very short time. A. Lusk & Co. do not hesitate to say that they will not have more than one-half their usual output if they do that.

The Pine Creek Mines, Oregon.

TO THE EDITOR:—As the value of silver mines is rapidly depreciating, and the future of silver to some extent at least has become a matter of uncertainty, it would appear that mining capitalists will turn more of their attention to gold mining.

This camp, Granite mining district, and known as the Pine Creek mines, with Cornucopia as its principal town, is located in Oregon, 60 miles northeast of Baker City, and within 25 miles of Snake river—the boundary line between Idaho and Oregon.

The mines contain about four parts in value of gold to one part of silver, and a portion of the silver is in alloy with the gold, the halance heing in the sulphurets; and as there are no chlorides of silver in the ore, there is no loss of silver by wet crushing. The length of the helt that paying mines have been found in is about six miles north and south and parallel to the strike of the veins, and its width continues westward across the branches of Eagle creek to Sanger, a mining camp, 12 miles distant from Cornucopia.

The first-class veins of the district are traced and located to a distance of 7000 to 10,000 feet, and the veins are from 18 inches to 7 feet in thickness, with a few bulges of outcrop heing much wider. The ore chutes are from 300 to 1100 feet in length—in fact, the chutes are longer than I know of in any other camp.

The average grade of the ores of the best mines must at best be only an approximation to their true value. But I will place the one-fourth of all of the ores of such mines at $8 per ton and one-half at $12 per ton and the remaining one-fourth at $28 a ton. This would give an average of $15 a ton. Many of our mine-owners will consider it too low an average, as considerable ore has heen shipped to Denver and Tacoma and in every instance the returns were above $100 a ton, and in one instance over $1200 per ton was realized; hut all of such shipments were of assorted ore and cannot be used in averages.

In the south portion of the mineral-hearing belt the country rock near the hase of the mountain is slate, hut at the upper portion and top of the mountain the country rock is stratified or secondary granite; and in the middle and north portions of the belt, which includes Bonaoza basin, the couutry rock from base to apex of mountain is stratified granite.

Pine creek, which is a tributary of Snake river, runs south through the district, and through the spring and summer months it contains from 10,000 to 20,000 inches of water and about 1200 inches through the winter. Pine creek divides the district into two unequal parts, and on the mountain slope in the west division are eight parallel veins in a transverse distance of 4000 feet, and the veins are so situated that a crosscut tunnel would cut them all. A majority of the mines located on these veins are in the hands of the original locators, many of whom are farmers in Pine valley and wish to sell.

The altitude of Cornucopia is 4600 feet above the sea level, and the altitude of the hest mines is at 5000 to 7000 feet. Timber is so plentiful that wood is delivered at $2.80 per cord.

The north end of Pine valley, which is 12 miles in length, is within four miles of Cornucopia, and daily through the spring and summer we receive cereals and vegetables from the valley. We have a daily mail from Union, the county-seat, which is 60 miles distant, and a tri-weekly mail from Baker City. There are 140 people in the district.

In the ahove I have given a hird's-eye view of the camp only, without goiog Into detail, as I well know that Californians wishing to invest in mines will do so after a thorough examination and endorsement of the mines hy experts in whom they have the utmost confidence, and my desire is to have experienced mining men come here and examine the mines of the district. Here we have large ledges carrying ore which will pay from 100 to 300 per cent ahove the cost of mining and reduction, and the veins are of such length and so close to each other that a numher of mines can, with great convenience, he worked from the same opening. Here is a great opportunity for the right class of mining men. But this is neither a pocket nor a chloride camp, and men with a few dollars expecting to make a fortune here will do better to remain away. There has been some talk of a railroad from Union to the timber region, west of here, and Baker City is agitating the building of a railroad to the Seven Devils. It would come within 14 miles of this place. Huntington has also heen talking of huilding a narrow-gauge to Cornucopia.

ROBERT KELLY.

Cornucopia, Union Co., Or., July 29, 1893.

Pocket Mining.

NUMBER V.

Free or Decomposed Pockets.

TO THE EDITOR:—The reason why pockets of this class are always found in decomposed quartz is because the combinatlon of the five minerals, mentioned in article No. 4, which are always present in this form of pockets, acts upon the quartz, and, being a strong decomposing agent, soon rots away the ledge at the point where they concentrate. The gold in those pockets is generally rough and "scraggly," and pieces are often found all honeycomhed like pumice-stone where the quartz has decayed away and left nothing in a solid form except the gold. Sometimes in the larger pockets of this class there is smooth gold, similar to well-worn placer gold, found in the center of the pocket; hut, upon examination, it will he found that those smooth nuggets have a coating or glazing of copper on the smooth surface and are more of an orange tint than the rest of the gold in the pocket. Sometimes those nuggets or pieces which are found in the center of the pocket are rough and scraggly on one side and smooth and glazed on the other. Those smooth pieces are found only in large pockets, and in pockets where they are found there is always a large percentage of copper in the mineral combination. Whenever the majority of the colors found in a free pocket trace are in the shape of needle points hroken off or "arrowheads," as the pocket hunter calls them, the trace is seldom worth following up, for the pockets that give such traces are invariably small and seldom amount to over $5 or $6.

They occur on small stringers of quartz not over a half inch in width and often not more than six or eight feet in length, and generally occur in soft, yellow porphyry. The best free pockets are always found in the porphyry or on or near the contact of the porphyry and serpentine. The most of this class of pockets when laid hare are very deceiving to the eye, for the reason that little or no gold is visihle, it being coated and concealed hy the iron oxide, etc.; but, when washed thoroughly in a pan, the decomposed matter will be found to he very rich. Then, again, in other cases, the gold being free from coating, will show so distinctly that the inexperienced pocket miner will think that the decomposed matter in the pocket is much richer than it really is. The flour gold is always in the top and bottom of the pocket; consequently, the flour gold in the trace will be found in largest quantities nearest the pocket when it is still in place, and, again, when the pocket is out and gone, the flour gold will be found in largest quantities near where the pocket originally was.

The experienced pocket hunter will soon detect hy the flour gold he gets in his trace whether the pocket is still in place or not. He does it in this way: By carefully examining the flour gold—if he finds the most of it very light in weight as well as in color, which he can readily detect hy his manipulations with the pan and by watching closely how the gold acts—he soon finds out whether the majority of the flour gold came from the top or hottom of the pocket. His judgment is hased upon the following facts: Say, for instance, that a free pocket contains 200 ounces of gold. The gold which comes from the top of that pocket we will say is worth or assays $17 per ounce; then it will he found that the gold in the center or middle of the nocket will he worth less, say $16.75 per ounce, and the gold in the hottom of the pocket will he worth still less, or about $16 per ounce, so thus it will he seen that the gold gradually diminishes in value from the top to the hottom of the pocket. Where the gold is more alloyed, natnrally, with silver than copper, this feature is more plainly noticeahle; and the prospector, finding the majority of his gold a light color and light in weight, and intermingled with white particles resembling gold coated with quicksilver, he naturally concludes that that gold came from the hottom of the pocket, and it is out and gone, and he is only getting the gold from the hottom of the pocket in the trace.

Free or decomposed pockets occur generally upon ledges that are harren except where the pocket exists, and the size of the pocket depends upon the size or width of the ledge and the amount of the mineral combination which concentrates where the pocket forms. ALEX QUARTZ.

English Mineral Statistics for 1892.

A serious falling off is shown In the value of the mineral products of Great Britain and Ireland last year when compared with that of the output in 1891. In the earlier year the value of the various minerals raised amounted to £91,238,000, but in 1892 it was only £82,350,000—a decrease in round figures of £9,000,000, or 10 per cent. To seek to explain this loss hy pointing out that to a very great extent it is the result of the diminished yield of one mineral only, viz., coal, would scarcely he just, seeing that the mineral in question forms upward of eight-tenths of the entire production. But however that may he. the value of the coal raised last year reached only £66,050 451, as agains £74,099,816 in 1891—a reduction of upward of £8,000,000. After these figures, the remainder drop into comparative insignificance. Leaving stone out of the question, the value of the quantity of which quarried is estimated at £8,667,736, the next most important item is iron ore, the tonnage of which mined last year was 11,312,675 tons, valued at £2.970,632. The value in this instance shows a decline of £385,000, which, considering the stagnation that overshadowed the iron trade last year, cannot be considered extreme. Following the metalliferous minerals, tin occupies the chief position—always excepting iron ore, of course—and the value of the output for 1892 amounted to £734.565, or within £1000 of the figure for 1891. In the well nigh fixed character of its production, tin holds quite a different rank from its sister metals—copper, lead, zinc, etc. In the case of the former of these, the value of the production, which in 1891 had already fallen to the extremely low amount of £20,214, reached little more than half that figure in 1892, or, say, £11,953, a fact which seems to presage the very early arrival of a day when copper mining in Great Britain will he a thing of ths past. The value of the lead ore raised last year was only £296,484, as against £356,783 in 1891, while of zinc ore £104 016 worth was produced, compared with £113,445 worth in the previous year. The statistics of the production of minerals in the different divisions of the United Kingdom show that the value of the production in England was £58 476,040; in Wales, £13,572,812; while the value of the output in Scotland reached £9 837,740. Ireland comes a long way hehind all her sister countries with a total of £387,128.—Industries and Iron.

Prospectors' Prices for Claims

TO THE EDITOR:—Some time ago I read an account of a prospector who told some capitalists to pay him what they thought the mine was worth, and they gave $10,000 for it, and in your comments you said if prospectors would more generally do likewise they would always get the value of the prospect. My experience has been different. I know prospectors generally set too high a price on their prospects, hut if they don't do it capitalists will not look at them at all, and often no matter what price is set the man with money wants it for less. For instance, I have now a prospect that a good many thousand dollars have been taken from. The ore from the chute, which is 100 feet long, has averaged $20 per ton. The mine looks as good as it ever did, hut if I ask $10.000 for it they want it for $5000. If I ask $5000, they offer $3000. If I price it at $3000, they think something is the matter with it, and if I offer it for $1500 they say it can be no good and will not look at it at all. I am, therefore, ahout changing my mind in regard to prospectors setting too high a price on their property. They have to do it in order to have any one examine it. I have yet to see the man who will offer anything for a property that the owner does not hold at a price above its real value. W. J. CLARK.

Grant's Pass, Or., July 16, 1893.

The West Kootenay Mining Region

The great Columbia river rises in the heart of the Rocky mountains, very clnse to the 50th parallel of latitnde, and runs in a northwesterly direction for a distance of ahout 175 miles, then turning sharply, runs directly south through British Columbia, a distance of nver 200 miles into Washington State, whence it continnes in a southwesterly direction to its home in the Pacific.

The area of mountainous country enclosed in this circular course, running around as It does and enclosing the Selkirk range and its spurs, passing through the two large sheets of water, the Upper and Lower Arrow lakes, and enclosing a conntry containing the great Kootenay lake and more famous Slocan lake and its trihutaries, with the ontlet nf the Kootenay river; the greater part of this large area is now on the map and known tn the mining world as the West Kootenay district of British Columhia.

Since the early days in the 50's, first the placer miner and then the seeker after quartz have pushed their way up the Columhia river and penetrated tn the head of its numerous feeders in search of anything of value in the mineral domain. With more or less success in the attractive search for the yellow metal, the time has rolled around when with the necessary means of transportation in sight, heralded by the huilding of the Canadian Pacific transcontinental railway, which crosses the northern part of the district, the huilding of which line attracted prospectors from all sections, ever ready to try a new field, and at the same time educated a number of men who found themselves in the country and took to prospecting, which has that alluring feature, the chance of finding the means to a fortnne or at least the acquirement of sufficient capital to raise them from that level—a hand-to-mouth existence. And a large percentage of those who have horne the heat and burden, the cold, rain and privations of the last few years; who have succeeded in gaining a grasp of the almighty dollar, is a very suhstantial and satisfactory proof of the wealth of mineral in this district. Considering the large area, the past inaccessihility of the country, the rugged, heavily-timbered character of its mountains, the cost of supplies, with the distance from and difficulty of attracting capital, the results have heen more than gratifying.

On the 9th of July, 1887, three locations were made, called the Kootenay Bonanza, Silver King and American Flag, hy a party of prospectors named Hall; situated on Toad mountain, on the divide hetween Cottonwood creek and Salmon rlver. This started what has heen since known as the "Toad Mountain Camp," and these three claims are now of world-wide reputation, known as the Silver King mine with a copper-silver hearing ore of high grade, which the owners have lately stocked on the London market for $2,000,000, after having done considerahle development work, sufficient to lay bare a mass of ore which gives suhstantial proof that this mine may soon he one of the hest producers on the continent.

The excitement following the discovery of the rich surface indications hy the Halls led to a rush into this section, where 300 locations were made in .this one mineral belt within a radius of a few miles and within six miles of the shores of the west arm of Kootenay lake, where the town of Nelson was staked off and started as a government headquarters for the dlstrict, which it has remained ever since.

On the large Kootenay lake, some 25 miles from Nelson, the existence of silver-hearing ore was known to the employes of the Hudson Bay Company as far back as 1825, when they had traders on these waters, and 40 years later, when placer miners penetrated this section, they carried away the knowledge of having seen silver-hearing ledges, and this knowledge bore fruit in 1883, when the Canadian Pacific railway was heading across the mountains, when prospectors spread over the country and a numher of silver-lead prospects were located around the shores of Kootenay lake, more or less of a medium grade, and a camp was started at a point called Ainsworth on the west shores of Kootenay lake. The value of these ores depended entirely upon cheap means of transportation, and their discovery did not create the stir that the richer ores of the Silver King did a few years later.

In 1889 a charter was granted to the Columbia & Kootenay Railway Company to connect the navigahle waters of the Columhia river (which extended from the crossing of that stream by the Canadian Pacific railway in the north to the international boundary, and then southward a total distance of over 200 miles) with those of the Kootenay river and lake. The course of this river was from a point at the mouth of the Kootenay river where it entered the Columbia (some 30 miles north of the boundary line), thence following the rapid and picturesque Kootenay to the smooth waters of the arm of Kootenay lake, a distance of 28 miles.

Construction was immediately commenced, and in 18 months trains were running from Robson, the Columbia river terminus (where connection was made hy large, stern-wheel river steamboats with Revelstoke), and Nelson, the Kootenay lake terminus and center of the district. Thls communication gave a great impetus to this section, and groups of mines were discovered throughout the district. The excellent fishing and superh scenery of these inland waters attracted tourists from all parts, who carried away with them the impression that the country possessed immense hidden wealth, and that, given time and capital, these sllent mountain valleys, which nature had molded with such a free and unstinted hand, by a grand compilation of her foundation material thrown up in such fantastic and rugged array, to surpass, if not in height at least in variety, her best efforts.

The fame of the Kootenay country traveled abroad, and the representatives of mlnlng capitalists visited the section, and more or less money was invested in development up to the fall of 1891, when, in Octoher of that year, a party of prospectors came from the divide between the mountains on the west side of Kootenay lake, at the head of Kaslo creek and Slocan lake. They brought back with them wonderful specimens of argentiferous galena running up into the hundreds of ounces per ton. This startled the whole mining population, and although late in the season, a stampede was made for the districts; a race for mines, townsites and land. Very little was accomplished as the season was so far advanced, hut the specimens were so rich and the ledges so large that the news spread like wildfire, and was carried all over the adjolning States; and hy the spring prospectors and miners came in from all directinns waiting for the snow to disappear.

The result of the prospecting of the season of 1892 proved the richness of the district, and some 900 prospects were located on the Kaslo Slocan mountains, amnng these such prospects as the Washington, Freddie Lee, Mountain Chief, Slocan Star, Slocan Boy, Big Bertha, Ruscan, Lucky Jim, Bluehird, and Lucky Boy.

Mining men frnm Montana and Colorado came in and looked over the couotry, and properties changed hands as mere "prospects" at hig figures. The richness of the ore was such that few mining men who had not seen the camp could he lead to helieve it, hut the rapid advancement of the country and the continued evidence of men who had visited the mines, together wlth the ore itself, hrought men from all parts. By the fall of 1892 ore was heing shipped, ohtained from the mere development work, and was of such a uniformly high-grade character that, after paying the heavy expenses of packing, it yielded a handsome profit; and some shipments of ore from this section are said to he the richest ever ohtained at a smelter. The result of this work was the springing up of the town of Kaslo, on Kootenay lake, which grew in eight months from a few shanties to a town of 2000 inhahitants.

The fall of 1892 hrought in a numher of new strikes throughout the district. Ledges reported in the Lardeau country at the head of Kootenay lake, of large size; and the report of another rich area similar to the Slocan, hrought in nearly all the prospectors from the Cœur d'Alenes, and the results of the summer of 1893 will, without douht, show up new camps.

The gold prospects of the Salmon river country, now heing opened up hy the huilding of the Nelson & Fort Shepherd railway, givlng direct communication with Spokane, are awakening a keen interest, and those who have heen over this section are of the oplnion that there is a large area of gold-producing country extending, as it does, from the Knotenay river to the Pend D'Oreille river.

Numerous prospects already found go to prove the richness of this section. A large placer claim is heing worked this summer on the Pend D'Oreille, which promises big returns, and other ground will he opened up this season after being thoroughly prospected and tested.

Altogether, capital amounting to $100,000 has been invested in these enterprises. Gold which has heen known to exist ln the Duncan rlver, a tributary of the Lardeu, is also drawing attention; and a number of prospects have been discovered, and also some placer ground.

The easy and comfortable means of access, the good accommodations to he found throughout the district, and the large and comfortable steamhoats plying on the lakes, make the section one of the most attractive for not only the mining man hut the tourist. The huilding of good roads hrings some of the grandest scenery within easy reach; larger and finer glaciers can he found, surpassing those in Europe, to see which so many travel thousands of miles, regardless of what is within easy reach on their own continent; together with fishing and hunting not to be found in the Old World. Carihoo, bear, goats and deer are to be found in large quantities on the tributaries of the Kootenay lake.—Spokane Miner.

Mineral Wax.

I notice an account and inquiry in *Science* of June 16th in regard to the receipt at the National Museum of specimens of natural wax coming from Portland, Oregon, derived from the shore of the Columbia river, and from other accounts it is found along the coast from the Columbia river to Puget sound.

The material has heen well known for the past half-century as mineral wax, native paraffin, ozokerite, and lastly as ozocerite, a hydro-carhon compound (hydrogen 15 per cent, carhon 85 per cent—varlable), supposed to be derived from hituminous and lignite coal formation by infiltration and crystallization. It is generally found *in situ* in the neighborhood of coal and lignite beds and in the bituminous clays or shales.

The legend as to its heing derived from a wreck is a most absurd one. It is a resinous wax in consistency and translucency, with structure sometimes foliated; color hrown or yellowish-brown by transmitted light; leek green hy reflected light; odor, aromatic, in specimens that I have examined, having the characteristics and feeling of beeswax that had been lying for some time in water.

It is mined in variahle quantities in Germany, Austria, Turkey and England, associated with the soft coal and lignite beds.

In Galicia alone about 30,000 tons have heeo mined since its discovery there in 1859. It is used in Europe principally in the manufacture of candles and hy refining in place of heeswax and paraffin. It is said to he an excellent electrical insulator.

In the United States it is mined *in situ* at Soldiers' Summit, Uintah county, and in Emery county, Utah. Sixty-five thousand pounds were marketed in 1888, with a yearly increasing output. The whole product of the United States in 1890, including the Oregon find, reached 350,000 pounds.

The imports of mineral wax, ozocerite, under the names of bay or myrtle, Brazilian and Chinese wax, in 1890 were over one and a half million pounds.

It has heen found *in situ* in thin seams in the lignite beds of Oregon, Washington and British Columbla. The deposits along the Columbia river and on the sea-shore of Oregon are no doubt the debris from lignite beds near by.—C. D. Hlscox, in Science.

The Economic Side of Electric Railways

A great deal of ill-directed iogenuity has heen devoted to showing that snch and such plans can he carried into effect, says the *Railway World*. Men have dehated whether engineering or climatic difficulties were insuperahle. There are few difficulties which can he termed lnsuperahle. But many enterprises which are practicahle are not likely to be profitahle. It is practicahle to establish a nniversity ln a region densely illiterate, hut lt might be argued that a few common schools would exert a more heneficial influence upon the community. The desire to build railways in order to attract settlement, to develop sections in advance of present needs, to erect a dozen houses for one tenant, has often manifested itself among our countrymen. While great benefits have sometlmes resulted from this progressive spirit, heavy losses have heen the inevitahle consequence of stagnant capital. Large sums have heen locked up in unprofitahle investments. Expansion has given way to retrenchment. Overprnduction has thrown industrious men into the ranks of the nnemployed. Every husiness man has seen instances of this, and yet the impulse tn move more rapidly than is consisteot with prudence, though occasionally checked, ls not cured.

The friends of electric railways seem to he pushing their pet improvement forward at a high rate of speed. It has heen shown that electricity can give the necessary power for transportation. At present, the power sometimes ceases, just when the car is in a dangerous position, and sometimes hreaks away frnm all control, and carries the vehicle forward at a rate more perilous than pleasant. Still electric transportation is a recognized force, and may he rendered more convenient and less dangerous in the future. The eulogists of the electric system apparently overlook the financial difficulties in the way of the success of their plan. Between a great city and a country village there is a marked difference. A city must furnish a large volume of passenger trafic. Many people live at such a distance from their places of husiness that walking would he out of the question. From their doors or from the nearest corners they hoard the cars, and are carried hack again in the evenlog. The street car companies of various municipalities have packed their passengers closely together in rolling stock of an inferior character, and have earned large dlvidends. Operation has been far less expenslve than in the case of steam railways, and gains have heen materially larger. There does not seem to he any good reason why electric railways in crowded cities should not he as profitahle as horse car lines and cahle lines have heen. Undouhtedly it would he foolish to minimize their importance.

But if the icicles melt in the sunlight, the figures hy which it is sought to prove that rural electric lines will earn rich dividends melt away under examination. A traveler glancing from a car window notices, or should notice, how few people are to he seen in the country hy comparison with those in a built-up street. The village with one long street and a few straggling lanes would not make a fair-sized ward for a city of the third class. A hasty survey of the railway stations, the stores, the schools, and the churches along the line might show that the population was only a fractional part of that to be found in great centers. Fields and woods take the place of crowded streets, and houses, instead of heing contlguous, are often separated hy several hundred yards or greater distances. Yet facts apparently visihle to the most careless observer are neglected by those who have caught the electric fever. If electric lines are paying investments in the cities, they must, so it is hastily concluded, he profitable in the country. No one would reverse this line of reasoning and conclude that hecause money can be made hy raising sweet potatoes in the country that occupation would be gainful in the hack yards of town residences. Yet, logically considered, there is little to choose between the two fallacies. Electric lines might easily pay where there are thousands of daily travelers, and fail to pay where travelers are few in numher.

While the difference in population hetween a city and an agricultural district is great, the difference in traveling population is still more noticeable. A large proportion of men and women in cities must ride daily from their homes to their places of business and back again. In country districts a large percentage of the population rarely finds it necessary to enter any vehicle except a wagon. Their occupation is such that it can be followed without buying tickets or monthly books. A factory operative may have to reckon car fare among the necessary expenses of life, while a farm hand may look on riding as an occasional luxury, only to he indulged in during the time of the country fair or the circus. There are farmers of considerahle wealth who spend very little money for traveling, and indeed have no occasion to do so. Wlth stables well filled wlth horses, and habituated from hoyhood to drivlng, they prefer to use their own teams on their journeys to the store, the polling place, or the dwelling of a kinsman. The constant though trifling outlays for transportatlon to which city people are accustomed is not agreeahle to the farmer, nor is it likely that he will ahandon the life-long hahit of driving merely because an electric line has heen built in the neighborhood. Whatever farmers may or may not do, they are not apt to change their long-established customs merely to oblige corporations.

Should electric lines he constructed through regions heretofore unprovided with any transportation facilities, except those of steam lines, many would from curlosity desire to ride in the new cars. This desire, however, would soon decline. It must be remembered that many who would enjoy a short ride in an electric car would be decidedly adverse to a jaunt of from 25 to 50 miles in such a conveyance, when a locomotive would make the trip in from one-half to one-third the time. When the electric cars are safe, they are slow. When they are fast, they are dangerous. Choosing either horn of the dilemma, the prospect is not flattering to those who have sung the praises of electric lines to connect distant cities. People can, no douht, ride 100 miles in an electric car; hut will they do so? Unless the national character alters, and to a desire to

reach the journey's end succeeds a wish to dawdle along the road, they will not. The electric car is, beyond question, a convenience to the man who has missed his train, but its availability for long rides when steam navigation is accessible is quite another matter. A road might pick up a fair amount of two-mile business, and yet find that 20-mile business did not materialize. Such views may not be progressive, but they are worthy of consideration. With the collapse of the narrow-gauge movement in one's mind, it is well to pause before accepting the predictions of brilliant success on the part of electric lines.

Possible litigation and other difficulties may yet increase the expense to which electric lines are to be subjected. At all events, the great profits have not yet been earned. It is easy to point out how grandly electrical science is developing, and how the remotest hamlets will be revolutionized by the new system that is to bind townships and counties in harmonious fetters. There is plenty of rhetoric on the side of the electric lines, but there are sundry economic reasons for doubting whether their triumph will be as overwhelming as has been claimed. From time immemorial it has been recognized that there is a difference between town and country, and the champions of electric railways seem to base their hopes on estimates ignoring this distinction.

The World's Gold and Silver.

At this time it may be interesting to glance at the production of gold and silver throughout the world during the past 20 years. In the quinquennial period embraced between 1871 and 1875 inclusive, the aggregate production of silver was 295,882,327 oz. In the next quinquennial period, between 1876 and 1880 inclusive, the output rose to 356,135,053 oz, and in the next five years it advanced to 437,907,539 oz. Between 1886 and 1890 inclusive, there was a further advance to 557,551,745 oz. The production of 1891 was 140,835,902 oz., while that of 1892 was 139,733,936 oz. It will be seen that there has been an extraordinary increase in the production during the past 22 years, and this has led to a gradual decline in the value of the ore raised. For the quinquennial period between 1871 and 1875 inclusive, this value was 78,608,483*l.*; in the next five years, 94,616,114*l.*; in the next five years, 116,338,643*l.*, and in the next five years, 148,127,453*l.* It will be seen on reference to the figures previously given that while the increase in the production was nearly 88 per cent, the increase in the value was only about 50 per cent. It is in the United States and Mexico that the production of silver has made the greatest progress during the last 22 years. Between 1871 and 1876 inclusive, the American output of silver was 121,262,248 oz.; in the next five years the production advanced to 157,622,000 oz.; in the next five years to 182,900,000 oz, and in the next five years to 230,980,000 oz. The production of 1891 was estimated at 58,000,000 oz. The Mexican silver output was 98,289,915 oz. between 1871 and 1875 inclusive; 98,433,240 oz. between 1876 and 1880 inclusive; 124,002,584 oz. between 1881 and 1885 inclusive; 150,519,519 oz. between 1886 and 1890 inclusive. The production of 1891 was 34,838,348 oz., while that of 1892 was 37,006,382 oz. The production of silver is increasing in importance in Australasia, but is still a long way behind that of Mexico or the United States. The substantial fact certainly remains that as the production of silver has increased, the intrinsic value of the ore raised has declined. The production throughout the world has remained practically stationary. In the five years between 1871 and 1875 inclusive, gold was raised to the extent of 28,026,514 oz.; in the next five years to the extent of 26,349,054 oz.; in the next five years to the extent of 24,567,749 oz., and in the next five years to the extent of 27,030,438 oz. The output of 1891 was 6,005,189 oz., while that of 1892 was 6,615,611 oz. The value has, of course, corresponded to the output, having been 119 051,026*l.* in the five years between 1871 and 1875 inclusive; 111,925,510*l.* between 1876 and 1880 inclusive; 104,358,883*l.* between 1881 and 1885 inclusive, and 114,819 893*l.* between 1886 and 1890 inclusive. The value of the output in 1891 was 25,711,232*l.* and that of 1892, 28,101,792*l.* The production of gold in Australasia between 1871 and 1875 inclusive, amounted to 10,533,131 oz.; between 1876 and 1880 inclusive, to 7,526,912 oz.; between 1881 to 1885 inclusive, to 6,909,642 oz.; between 1886 and 1890 inclusive, to 6,885,653 oz.; in 1891, to 1,470,585 oz. and in 1892, to 1,550,000 oz. The United States produced 9,475,723 oz. of gold between 1871 and 1875 inclusive; 9,530,510 oz. between 1876 and 1880 inclusive; 7,730,324 oz. between 1881 and 1885 inclusive; 8,070,221 oz. between 1886 and 1890 inclusive; 1,604,840 oz. in 1891; 1,650,000 in 1892. The gold production of Russia is not without importance, but is sensibly smaller than that of the United States.—American Manufacturer.

Gold Yield of New South Wales.

The gold returos of New Sonth Wales for the last 40 years or so are given in the annual report of the Minister for Mines and Agriculture, which has just come to hand, and the figures are well worthy of attention. The returns show at a glance the remarkable ups and downs of the gold-mining industry of the colony from the year 1851, when gold was first discovered, down to last year, and, although the figures for the last half of the period are considerably below those of the first 20 years, they are not without some gratifying and hopeful features. The colony started off in 1851 with a total output of 144,120 ounces—a very fair thing for a maiden effort—and rose by a gigantic leap in the following year to 818,751 ounces, which to this day constitutes the record. In 1853, the output was 548,052 ounces, but fell next year to 237,910 ounces, going still lower to 171,367 ounces in 1855. Low ebb totals prevailed for a year or two, and things again brightened up, for the figures rose from 175,949 ounces in 1857 to 640,622 ounces in 1862. The down grade was again entered upon until the figures fell away in 1870 to 240,858 ounces, only to rise again in 1871 to 323,609 ounces, and in 1872 to 425,129 ounces. This, however, was the last real spurt, and from 361,784 ounces in 1873 the totals got down to 109,649 ounces in 1879, and, with slight fluctuations, kept down till 1888, when the lowest point in the history of gold-mining was reached, the total yield being only 87,503 ounces. The year 1889 showed a great improvement with 119,759 ounces; 1890 was better with 127,760 ounces, and the last two years were still more satisfactory with 153,336 ounces for 1891 and 156,870 ounces for 1892. The total amount of gold produced in New South Wales to the end of 1892 was 10,530,322 ounces, valued at £39,202,655 15s. 2d.

Geology of Building Stones.

Of interesting sciences there are none more so than geology—the study of the earth. The material substances about us, the handwriting of Dame Nature, is by the power of human reasoning made to reveal the secrets of the past. With this mighty weapon knowledge is well armed in the constant conflict with tradition, superstition and falsehood.

But there is to be found in this great historical warehouse one chapter that reaches its usefulness out to us in our every-day life and adds an interest to what may at first seem to be things of the commonplace.

I will say "stones for building." To the layman this conveys little more than the idea of a block of hard material that has proved a very useful thing with which to construct a habitation. To the architect it conveys a feeling of pleasure, a friend of great possibilities, while to the mason it is the staff, the rib of his existence; but to the geologist the words are of significance—the rib of the world. Of these, which is the more exalted? Let us listen to the geologist. With pleasure, if he will drop the isms and asms of the technical.

Order is one of the first and best laws of nature. The geologists are orderly, or nothing. Thus they began a classification in the earliest stages of their investigation of the earth's rocks. In this first arrangement, such rocks as were supposed to have been original in their formation were called primitive, and such as were composed by the disintegration of others were called secondary. In the primitive rocks there are never found the remains of organic substances, as shells or plants, from which fact we infer that they were formed prior to the existence of life in any form. On the other hand, the secondary class often contained fossils of all kinds, and portions of what must at one time have been primitive rocks. But these early scientists were entirely too simple in their nomenclature for the modern schools. Since that time the latter have been busily engaged in inventing new names and championing them abroad after their invention.

For the use of the laymen, however, an easy classification of rocks is as follows: 1. Primary. 2. Transition or intermediate. 3. Secondary, (*a*) lower secondary series, (*b*) upper secondary series. 4. Tertiary. 5. Basaltic and volcanic. 6. Diluvic and alluvial.

Before taking these up, I should not forget to mention what a rock is.

"Oh, everybody knows what a rock is."

All right, then, what is it?

"A rock is a—a—rock."

I thought so too. A rock is an aggregation of minerals occupying a definite position in the earth's structure. It could be one mineral as well as more than one, but as a matter of fact the pure mineral is never found.

The primary rocks are the ground work of the globe; they are the ribs of the world. They rise into lofty mountains and are the floor beneath which we have never penetrated. One of the most notable of these rocks is granite; I might better say granites, for the number of kinds is legion. However, the differences are very small, indeed, being more in what are really impurities than anything else. The usual three minerals are found in them all, quartz, feldspar and mica. Quartz is a white, glassy substance that breaks in an irregular manner. You have often broken the smooth white pebble that so abounds wherever there is running water. Ten chances to one that pebble is quartz. It is the mica in granite that sparkles so. The bits are small sheets or leaves, very small indeed, but still abundant enough to give the greenish tint so often noticed. Large pieces of this same mica is called isinglass and is certainly familiar.

Other primary rocks are gneiss (pronounced like the word nice), mica slate, clay slate, primitive limestone, porphyry and syenite. They are all, as a rule, crystalline in their structure and never contain remains of organized substances or portions of other stones. By organized substances we mean living things, as plants and animals.

Gneiss and mica slate are composed of the same materials or minerals as the granites, only arranged somewhat differently. The grains are, as a rule, very much smaller than in the granite. In gneiss the quartz and feldspar are very closely aggregated, while the mica is arranged in scales between strata of the same; hence it is that gneiss is really a stratified rock, and if a section or break be made at right angles to the strata it will present a striped appearance, for the quartz and the feldspar are nearly white and the mica a narrow band of green. Often the mica is a deep black.

Mica slate is composed principally of quartz and mica and a very small portion of feldspar. The latter is sometimes all but absent. The quartz is commonly in the form of fine sand and the mica in flakes. The latter predominates, and sometimes seems to be the entire composition of the rock. Mica slate differs from gneiss in having such a small portion of feldspar, and more in the positive stratification, which is so marked that it is easily separated by wedges into plates or layers. An example of the latter quality is found in the common flagstone.

These three stones—granite, gneiss and mica slate—form what is known as the granite group, and together they form the major portion of the earth's crust. The gneiss is intermediate between granite and mica slate in its structure, and is often found between these rocks, lying over the former and under the latter. Sometimes the transition is so gradual as to be hardly perceptible, the granite growing to a stratified gneiss, and the latter as slowly into fissile mica slate.—Edward C. Weaver in Stone.

Cornish Mines and the Royalties They Pay.

It is with great regret we see the startling figures that have been recently published showing that as between 1890 and 1893 the market value of Cornish mines has decreased by no less an amount than 1,210,000*l.* If the occasion required, we could produce figures to show the marvelous advance in value of these shares within a similarly selected period. Our experience of Cornish mine quotations has been this: That, probably, for a series of years, say five or six, and even up to ten, they have gradually declined in value almost month by month, and then there has been a sudden revival of the spirit of speculation, or there has been a big rise in the price of tin, whereupon, heigh presto! Cornish shares have bounded upward and the world has marveled. Several of these rapid changes have occurred within our memory. At the present time Cornish mines appear to have reached the Nadir of quotations, and old experts, with wisdom to discern the signs of the times, will probably think them more worthy of attention at a moment like this than when they have had one of those sudden rebounds to high prices, in which this section of the market is so prolific. There are some of the shares in the list that are absurdly below their value. For example, if Carn Breas were worth 68*l.* in a time of inflation, surely, with much more development work done and better prospects, they must now be worth more than 12*l.* The fall in market value of this mine alone is 366,000*l.* Tincroft, near its neighbor, has fallen from 33*l.* to 12*l.*, but surely the real value of the shares if then lower than the higher price is now higher than the lower price. Take, for example, Wheal Grenville, quoted at 18*l.* in 1890 and at 15*l.* in 1893. Why? The value of the mine at the two dates almost defies comparison. In 1890 the committee were only contemplating the reopening of the eastern section, and the raising of capital for the purpose, whereas in 1893 the capital has been raised and the work has been accomplished, with a measure of success beyond the most sanguine hopes at first entertained. Will any man in his senses say that Wheal Grenville shares are intrinsically worth 3*l.* less today than they were in 1890? We speak as unto wise men.

While on this subject we have lately been at pains to collect a list of the royalties paid by the leading mines of Cornwall, with the following results: Levant pays 1-24th dues on tin and 1-20th on copper, with the usual water charges. Botallack has not paid dues for some years, but, if making profits, would probably pay at the same rate as Levant. South Wheal Frances pays a small amount in dues to Mr. St. Aubyn on tin raised from Grilb's estate; it is 1-120th, and last year amounted to 59*l.* 15s. 1d. West Wheal Frances pays 1-24th, South Condurrow 1 48th, Cook's Kitchen 1-15th, New Cook's Kitchen 1-15th, Wheal Kitty 1-60th, Prince of Wales 1-18th, by lease, but the company is now only paying one per cent, or about 38*l.* a year. Wheal Metal and Flow pays 1-16th from the Flow and 1-30th from tin broken underground. Wheal Uny was paying nothing at the time of its suspension, and a similar remark would apply to Wheal Crehor. East Blue hills has not paid any royalties for 10 years or more. West Kitty pays 1-18th on 5-6ths of the property and 1-20th on about the other 6th. No royalty is being paid by Wheal Friendly, as the mine is not productive, but when it is the lease provides for a royalty of 1-18th, and Polberro pays 1-20th. Carn Brea pays 1-18th on gross returns, Tincroft 1-40th up to 55*l.* per ton for tin and 1-24th above. Dolcoath pays 1-18th and East Pool the same on tin and 1-15th on copper. Killifreth (the only mine in the county whose shares show improvement on a three-years' retrospect) pays 1-4th for three years and then 1-25th, provided the new engine be working within 15 months from date of the new lease. West Frances pays 1-24th. Wheal Agar has paid no dues of some time, but last year paid 1-120th, and of Wheal Agar and Wheal Bassett a similar remark may be made. These payments are, of course, subject to frequent change, but, as given above, they practically form a sound basis for argument and for information.—London Mining World.

Can Destroy Logging Streams.

Mealy-Lacy Company, of Chehalis, Washington, recently closed up a law suit in the Superior Court of Lewis county in which the ruling of the court seems hardly fair for the mill company, no matter how legal it may be. The case is of interest to lumbermen who depend on the smaller streams of the State to carry their logs to mill. The case was prosecuted by the mill company above to ascertain whether or not the statutes would protect streams by preventing farmers and others from using them as dumping places for brush, stumps and logs. The temptation to use the streams for this purpose is evident to any one who ever cleared up a farm. It is an old custom, apparently having been adopted by the first settlers.

The testimony proved conclusively that the defendant had obstructed the stream, in fact neither the defendant nor his witnesses denied the fact, but they claimed that the logs, which had fallen into the streams, had been cut up into short lengths, so they would float out in high water.

The defendant claimed that in clearing the adjacent land it was not possible to prevent the trees falling into the stream. It was proven by the mill company that the stream had been used for log driving for a distance of ten miles above the point obstructed. It was also shown that the obstruction had been in the stream for over two weeks previous to the filing of the complaint. The court instructed the jury that if they found from the testimony that the obstruction was not maliciously placed, to acquit the defendant.

The jury brought in a verdict acquitting him. If this case stands it is evident that any of the logging streams in the State are liable to be ruined for logging, as it will always be a difficult thing to prove work of this character malicious. This case should go to the Supreme Court, and if not reversed, the statute should be so amended that all logging streams in the State will be fully protected.—West Coast Lumberman.

Brannt's Varnishes, Lacquers,

Printing Inks and Sealing-Waxes.

JUST READY.

Varnishes, Lacquers, Printing Inks and Sealing-Waxes: Their Raw Materials and their Manufacture. To which is added the Art of Varnishing and Lacquering, including the Preparation of Putties and of Stains for Wood, Ivory, Bone, Horn, and Leather. By Wm. T. Brannt, Editor of "The The Techno-Chemical Receipt Book" Illustrated by 39 engravings.

In one volume, 12mo, 338 pages, price $3.00, by mail, free of postage to any address in the world.

ABSTRACT OF CONTENTS. — I. Introduction. II. Raw Materials. III. Oxidizing Agents (Driers), for Converting Oils into Siccative or Boiled Oils. IV. Dissolving, Roasting and Distilling of Resins. V. Preparation of Siccative or Boiled Oil. VI. Preparation of Oil or Fat Varnishes. VII. Preparation of Volatile or Spirit Varnishes and Lacquers. VIII. Miscellaneous Varnishes and Lacquers. IX. Manufacture of Printing Ink. X. Fabrication of Sealing-Wax, Appendix. The Art of Varnishing and Lacquering. Index.

Price $3.00, by mail, free of postage, to any address in the world.

Mechanical Progress.

An Important Armor-Plate Test.

On Tuesday last the third of a series of very interesting armor-plate tests took place at the naval grounds 20 miles south of Washington City, on the Potomac river, says the *American Manufacturer*. The tests were for acceptance and for premium, it having been stipulated that if the plates resisted penetration under a certain prescribed velocity, the makers should receive a premium of $30 to a ton, in addition to the contract price of $575 a ton.

Two plates were tested. The first was a 9-inch plate, 6 feet and 4 inches wide and 9 feet 7 inches long, nickel steel, made by the Carnegie Steel Company of Pittsburg. Three Holtzer projectiles weighing 250 pounds each were fired against it from an 8-inch rifle, the muzzle being 58 feet from the face of the target. The first projectile had a velocity of 1400 feet a second at the moment of impact, and penetrated the plate and oak packing to a depth of 11.7 inches. The second projectile, with a striking velocity of 1683 feet, went through the plate, three feet of oak backing, and lost itself in the earth against which the butt was built. The third projectile had a velocity of 1536 feet, and penetrated plate and backing to a depth of 14½ inches.

The plate well withstood the strain of the attack, no cracks being perceptible, and it fully met every requirement for acceptance, but the result of the second shot deprived the makers of any chance for the premium.

The test of the second plate was an exact duplicate of the first in its results. It was a sample of the curved plates for the barbette on the Indiana, made by the Bethlehem, Pa., company, and like the first of nickel steel. Its dimensions were 8 feet 4 inches in height, 12 feet 1 inch in length and 17 inches thick, forming a mass weighing 31½ tons. It was the heaviest plate yet tested. It was subjected to attack from a 12-inch rifle, which threw a monster Carpenter shell weighing 850 pounds. Its muzzle was 319 feet from the face of the plate. The striking velocity of the first shot was 1322 feet a second and it penetrated to a depth of 16.6 inches, lacking less than one-half an inch of going through. The second shot was fired with a velocity of 1495 feet a second and went 3 inches into the oak backing.

The third and last shot was to determine whether or not the premium was to be paid, and the velocity was raised to 1858 feet a second. When the smoke and dust following the discharge had lifted, it was found that the shell had gone clear through the plate and 36 inches of oak backing, and then, finding the embankment rather thin, it disappeared and was not recovered. The plate secured for its makers the acceptance of the whole contract, amounting to from 500 to 700 tons, but earned no premium. Like the Monadnock plate it showed no cracks under the terrific strain to which it had been subjected.

Even more satisfactory than the showing made by the plates was that of the projectiles. The 8-inch shells were of the Holtzer conical pattern, and the 12-inch of the Carpenter conical pattern. Four of the shells that were recovered appeared wholly unchanged, and the gauge showed that they were disturbed to such a small degree that they might again be fired with the attachment of a new strip of rifling.

Some idea of the force with which the shells struck the face of the plates may be gained from the fact that the energy of the last shot fired was equivalent to the force necessary to move a mass of 21,600 tons through one-foot of space.

A Steel 150-ton Pillar Crane.

A 150-ton crane has been placed on Finnieston Quay, in Glasgow, and officially tested by lifting a load of 150 tons of steel rails 20 feet high and making a complete revolution with this load. This steam pillar crane was built by Cowans, Sheldon & Co. of Carlisle. The framing, shafting and jib are made of mild steel; the gearing is generally cast steel and the rollers and pathway are of the latter metal.

The center is a casting of nine tons held down by six steel bolts, each 38 feet 9 inches long and 5 inches in diameter. The six washer plates are each 6 feet square, and are built into the masonry of the seat at a depth of 30 feet. In this center casting is the 17-inch center pin weighing six tons. The diameter of the roller path is 33 feet, and it weighs 12 tons. In the live roller ring are 75 cast steel rollers, with a maximum diameter of 14 inches and an aggregate weight of 10½ tons. The frame is 27 feet high and weighs 50 tons, and carries a boiler 14x6 feet, weighing six tons.

The jib is made of two tubes each 3 feet 3 inches in diameter at the center and 90 feet long. Including the stays, it weighs 45 tons, and its extreme height above the quay level is 110 feet. The center of the 5½-foot jib head pulleys, for heavy loads, is 100 feet above the quay; for light loads a 2½-foot pulley is used, and the height for this 107½ feet above the quay. The single tension rods are 10x2¾ inches, and the double tension rods 10x1½ inches, and the pins are 8 inches in diameter. In the ballast box are 100 tons of iron and steel punchings, and exclusive of this back balance the crane weighs 270 tons in working order.

The crane has two speeds for heavy lifts, 130 and 60 tons, and two for light loads of 20 and 8 tons, respectively. There are also two speeds for revolving the crane. The lifting and lowering ropes are made of plow steel wire. Eight 2½-inch seven-strand rope take the heavy lifts; the six strands of patent steel are wound around one strand of soft steel, with the outer six taking the strain. The light loads are taken by a double 1¼-inch rope of seven strands, arranged as before, each made of 37 wires .06 in diameter. The gin block for heavy work has four 5¼-foot pulleys and measures 12x7x3 feet, and weighs about 7 tons.

The radius of sweep for heavy lifts is 65 feet, and for light lifts 69 feet 9 inches. In a late test the 60-ton load was lifted at the rate of 8 8 feet per minute and the 130-ton load at 4 feet per minute. A complete revolution was made with the former load in 2 minutes 17 seconds and with the heavier load in 5 minutes. The total cost, including the masonry seat, was a little less than $80,000.—Engineering News.

The New Army Rifle.

Soldiers of the United States Army will be armed, within a few months, with magazine rifles of the Krag-Jorgensen type. This decision was reached about six weeks ago by the Board of Ordnance and Fortification, in session at the Government Building in Jackson Park, Chicago.

The decision is one of considerable importance. It declares in effect that American inventors have not yet made a magazine rifle which can compare with this model of foreign skill. Awaiting only the final approval of the Secretary of War, it will settle at last a controversy which has been raging for more than two years in military circles.

Early in 1891 a special board of army officers was appointed by the War Department to investigate and examine models of magazine rifles and report as to which one seemed best suited to the needs of the United States Army. Magazine rifles of every prominent type were submitted to the board for its examination, and its report, after two years' work, was in favor of the Krag-Jorgensen gun.

American inventors and makers of firearms were, however, not satisfied. They argued that it would be only patriotic to buy the arms for the national army of home manufacturers, and they succeeded in passing through Congress a measure, which was approved Feb. 27, 1893, to the effect that the whole business should be most thoroughly and carefully reviewed by a new board of army officers. The evident meaning of this enactment was to give every possible chance for the American inventor.

In pursuance of the provisions of the above bill, a commission of army officers was duly appointed. It held long sessions in Springfield, Mass., and before it were brought models of magazine rifles by nearly every prominent American inventor. Its report, which was considered by the National Board of Ordnance and Fortification, as above, favors the Krag-Jorgensen gun, and declares that it has been found superior to all weapons of American invention brought to its notice.

A LARGE GIRDER.—The largest girder ever shipped in one piece has recently been received at the new Broad-street station in Philadelphia. It is 58 feet 1 inch long, 10 feet 6 inches in height, and rests on a plate 2 feet 6 inches broad. The Philadelphia Bridge Company, its maker, claims that this giant, weighing 110,780 pounds, is the heaviest and largest steel girder ever turned out complete by any iron works in the United States. The girder is placed across Fifteenth street on the south side of the great station, and is designed to support the weight of the seven stories of brick of the office building on the Market-street front. It was forwarded from the manufactory on two flat cars of 100 tons capacity each. The girder was so large that it could not be constructed within the works at Pottstown, but the work was carried on in a field alongside the iron shops. It took about two weeks to put it together after the steel plates of which it is built were made. It has three webs running through its entire length. When in place over Fifteenth street, it will have a clear span of 56 feet, and will be 36 feet above the sidewalk.

Scientific Progress.

Velocity of the Transmission of the Flame of Firedamp.

The burning produced at one point of a gaseous combustible mixture is transmitted with a velocity depending upon a great many different conditions, *i. e.*, proportions of the gases mixed, the rest or motion of the gaseous mixture, and nearness to solid cold bodies. The French Firedamp Commission, by a number of experiments, tried to determine the influence of these several circumstances, which are intimately connected with the degree of security obtained by lamps.

The velocity of propagation varies, firstly, with the proportion of firedamp contained in the mixture, and it evidently neither reaches a maximum at either of the two extreme limits of combustibility, nor does it correspond, as one might be led to think, to the mixture for complete combustion, but rather to a mixture containing a certain excess of combustible gas. The highest velocity observed has been 1.97 feet per second.

Proportion of $C_2 H_4$ in 100

Vols. of mixture.....	6	8	10	12	14	16
Velocity in feet....	0.13	0.72	1.38	1.97	1.21	0.24

In a mixture containing an excess of oxygen, the substitution of nitrogen for the oxygen which is in excess of that necessary for combustion does not effect the velocity of propagation. Carbolic acid, on the other hand, perceptibly lowers this velocity. The preceding results apply to mixtures at rest, while the velocities are changed entirely when the gaseous masses are in motion during combustion.

Mixtures which at rest give the slowest propagations may become instantaneous, that is to say, truly explosive when they are stirred up at the moment of combustion by a very energetic movement, such as would be produced by a jet of gas escaping at a high velocity into a mass of gas at rest. This is the explanation of explosions of firedamp in mines. If the velocity of propagation never exceeded 1.97 foot per second the mechanical effects would always be nothing and the workmen could escape from the flame.

Precise experiments have never been made upon the velocities thus developed. It is only known that in the laboratory in small tubes 1.18 inches in diameter and 6.56 feet long we can obtain velocities greater than 65.6 feet per second, and it is perhaps by hundreds of feet that the extreme velocity obtained in the explosion of firedamp should be calculated.

The spontaneous movement of gaseous masses during combustion is not an exceptional phenomenon; it is, on the contrary, the rule, and in order to avoid it only partially in laboratory experiments it is necessary to take very special precautions.—American Gaslight Journal.

Iridescent Photographs.

As a matter of fact, there is one sort of color photography which is no longer in any sense a "nebular hypothesis," excepting by reason of popular incredulity and ignorance, says the *Optician*. The process of Lippmann or Raleigh, which is, of course, what we refer to, is, in principle, the most wonderful innovation in photography which has been made since the first invention of that art. The strata of violet iridescence lie at the limit, and those due to the more lengthy stationary waves near to the limit of possible microscopical separation. And thus the realization of this process intimates to us, among other things, how perfect is the control which may be afforded by optical methods over the dispositions of what might be termed molecular mechanism.

It is possible, as has been already intimated, to produce Lippmann's or Raleigh's images in such a manner as that the periodic structure may be correlated, not with the almost infinite range of tints of nature, but with a limited number—say three—which may be described as the equivalent tints of visual color sensation; and we can assert that in this way it would be easy to make a great improvement on the "original" form of the Lippmann process.

The three images could be taken on three several films, and then optically re-combined—most simply, although, of course, in a somewhat imperfect manner, by direct superposition of the films, as in composite photography. The specific courses of procedure which may be adopted are simple enough. Three suitably color-sensitized plates may be exposed, either singly in monochromic lights or together in white light, whether this latter be a physically white light, *i. e.*, a mixture of waves of all lengths, or a trichromic mixture that is merely visually white. Here the efficacy of a dispersive element in the optical system may be pointed out. By the ordinary ground glass of the camera, stereoscopic effect is eliminated, so that it becomes possible to obtain three simultaneous projections of the image, which are alike in all respects, by the employment of three several refracting systems upon the farther side of the ground glass—we mean upon that side which is remote from the principal lens. Other methods for the simultaneous production of the three images may be used, as, for instance, has been shown by Mr. Ives, or as has been described by us.

Such tricolor iridescent photographs as we now refer to would be most advantageously viewed in what we may call a very closely sifted trichromic light; and several different methods by which such light, of nearly definite wave lengths, can be readily sifted out have been already described in our columns. In making the original photographs in light of this kind, there would be no necessity to employ color-screens in connection with the camera, and either a plate having three superposed films, each selectively sensitized for one kind of light, or a single orthochromatic film, as in the present Lippmann process, could be used. In the result we should have a very excellent form of iridescent photo, impressing upon our eyes the equivalent of every possible tint in nature, yet involving absolutely the minimum of complexity of dimorphic structure. Needless to add, the light (if ordinary white light is used) for viewing such photographs should be intense, as only a fraction of it is utilized.

The light which is not utilized in viewing iridescence photographs, or that which in place of being reflected to the eye is transmitted through the film, should be completely absorbed by a black backing. But here it may be remarked that even the simplicity of the above-described processes could be further improved on by sandwiching between the black backing and the stratified film a photograph in pigment representing one of the three visually fundamental hues. Pigment images can be produced of such pure tints that three of them, optically combined, exhibit an almost perfect range of color; and hence, no doubt, with one such image and an iridescent film showing the other two colors, by reason of only two different kinds of stratification, a somewhat similar result could be obtained.

The Bed of the Atlantic.

Proceeding westward from the Irish coast, says the *Nautical Magazine*, the ocean bed deepens very gradually; in fact, for the first 230 miles the gradient is but six feet to the mile. In the next 20 miles, however, the fall is over 9000 feet, and so precipitous is the sudden descent that in many places depths of 1200 to 1600 fathoms are encountered in very close proximity to the 100 fathom line. With the depth of 1800 to 2000 fathoms the sea bed in this part of the Atlantic becomes a slightly undulating plain, whose gradients are so light that they show but little alteration of depth for 1200 miles. The extraordinary flatness of these submarine prairies renders the familiar simile of the basin rather inappropriate. The hollow of the Atlantic is not strictly a basin whose depth increases regularly toward the center; it is rather a saucer or dish-like one, so even is the contour of its bed.

The greatest depth of the Atlantic has been found some 100 miles to the northward of the island of St. Thomas, where soundings of 3875 fathoms were obtained. The seas around Great Britain can hardly be regarded as forming part of the Atlantic hollow. They are rather a part of the platform banks of the European continent which the ocean has overflowed. An elevation of the sea bed 100 fathoms would suffice to lay bare the greatest part of the North Sea and join England to Denmark, Holland, Belgium and France. A deep channel of water would run down the west coast of Norway, and with this the majority of the fiords would be connected. A great part of the Bay of Biscay would disappear, but Spain and Portugal are but little removed form the Atlantic depression. The 100 fathom line approaches very near the west coast, and soundings of 1000 fathoms can be made within 20 miles of Cape St. Vincent, and much greater depths have been sounded at distances but little greater than this from the western shores of the Iberian peninsula.

Professional.

EVERETTE'S MINING OFFICE.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
Mining Law, Mine Examinations, Metallurgy.
ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.
DR. WILLIS E. EVERETTE, 1318 E. ST., Tacoma, State of Washington, U. S. A.

The Explorers' and Assayers Companion.
A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from ormulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

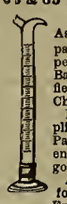
JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco


We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.C. BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1893. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.
Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Electricity.

Electricity in Agriculture.

During the last few years there has been much discussion and not a little experimental work in the application of electricity to agriculture. Interest in this subject was doubtless stimulated by the action of Congress in providing for the establishment of an experimental station in which mechanical apparatus adapted for farm work could be tested in actual operation. As Prof. Shepardson points out in an article on "Electricity in Agriculture," there has been little work of practical value aside from the experiments looking to the application of electrical devices to the operation of farm implements. True, there have been attempts at forcing the growth of vegetables and plants. It has been generally admitted that periods of darkness are not essential to the growth and development of plants. Those who have worked in this field of investigation claim that the electric light promotes assimilation, hastens growth and maturity, intensifies colors of flowers, and sometimes increases their productiveness. The experiments along this line have, nevertheless, led to conflicting and indefinite results. Under some conditions the presence of electric light at night is a great advantage, but in other cases it is detrimental. Currents of electricity have been applied to the soil by many experimenters and in different ways. Lagrange had a number of pointed conductors in the air, connected with a network of galvanized wires buried in the soil. Others have buried plates of zinc and copper, which were connected by an insulated wire so as to form an earth battery. Still others have buried in the ground plates or wires, which were connected with a battery or other source of current. By each of these methods current is sent through the soil and the vegetation in the vicinity is affected, apparently by electrolytic action upon the soil. The results obtained in these ways have been as contradictory as those obtained from the application of static electricity or the electric light. Under some circumstances the current through the soil seems to exert a beneficial effect. In other cases it seems to be detrimental. Lagrange draws the conclusion that current electricity is better for plant cultivation, while static electricity is better for ronts. A number of experimenters conclude that the use of electricity is good for some plants and bad for others. Still others claim it is not only useless, but harmful in every case. Prof. Shepardson concludes that the action of electricity upon plants is like that of certain chemicals upon the human body. In small doses they are helpful stimulants; in large doses they are fatal poisons; or in still larger doses they are less harmful. He summarizes the present state of the art as practically this: "Electricity donbtless has an action upon vegetation, but the conditions for its best application are but little better understood than they were years agn. It is noticeable in the report of all the experiments that no quantitative measurements have been made of the electrical energy developed or applied. In view of the contradictory results obtained from experiments, we are sometimes forced to the conclusion that for most, if not all, plants a certain amonnt of static or cnrrent electricity is valuable. For knowledge further than this there must be carried on, with greater care and intelligence, experiments in which a study may be made of the best methods of applying electricity, and the proper amount to be applied under varlous conditions."—Western Electrician.

Electric Motors for Steam Roads.

In the current issue of the *Railroad Gazette* there is an Interesting article on "Electric Motors for Steam Roads—A Step in Progress," reviewing the problems encountered in the bullding of the electric locomotive illustrated in the *Western Electrician*, April 22d. It will be remembered that this electric locomotive is the heaviest in the world, and it is pronounced by steam engineers to be "the first substantial attempt to put an electric locomotive in the same service as the steam locomotive." It compares favorably with the steam locomotive, and is admitted to be "one of the most interesting machines that has been brought out for a long time." One advantage of the electric locomotive over the steam engine was demonstrated in a test with a steam-switching engine of equal weight. It was a surprise to the steam-locomotive engineer to find that an electric locomotive could pull his engine backward against her own steam pistons with the throttle wide open. The reason attributed is that the steam locomotive, while having equal adhesion, cannot utilize the total adhesion during the entire revolution of the drivers owing to the fact that the turning moment produced by the steam piston varies fully 25 per cent at different points of a revolution, and the maximum turning power cannot exceed the adhesion of the drivers. This leaves the minimum 25 per cent below the adhesion of the drivers, whereas the electric locomotive has a constant turning power and the minimum is therefore greater than the maximum of the locomotive, with the natural result that the electric locomotive can pull the steam engine backward when there is equal weight on the drivers of both. For elevated railway service, such as that given by the Chicago and New York lines, railroad men agree that the electric locomotive is much more economical than the steam engine where anthracite coal is used. The question of repairs for elevated railroad work is an unknown factor, but based on the experience of the intramural road at the World's Fair, it is conceded that the repair account would be very much less with the electric than with the steam locomotive, besides having the advantage of less complication and requiring much less attention while in service. The *Railroad Gazette* says: "To civil and mechanical engineers, as well as to railroad men, the intramural road will probably prove to be one of the most interesting exhibits at the World's Fair, standing, as it does, as a representation of the nearest approach to the substitution of the electric for the steam locomotive in actual daily work."

Electric Railways and Turnpike Companies

Prudent farmers are anxiously considering the dangers to be apprehended from the introduction of the electric roads. They recall to memory many trying adventures experienced before their horses became thoroughly accustomed to the steam cars. Horses, intelligent and tractable as they are by nature, are also remarkably nervous, irritable and easily terrified by unusual sounds and sights. At the first introduction of railroads the tracks were few and the trains infrequent, and the most careful farmers for a considerable period timed their errands of business be the passing of the trains, so as to avoid any direct encounter with the new and terrifying spectacle, until by a gradual course of apprenticeship the wary animals became accustomed to the novel experience. It is remembered that farm-work was also occasionally seriously obstructed by the fact that horses well trained to the plow, and otherwise amenable to the control of the master, could not be employed in the fields near the railroads, as the noise of the trains rendered them utterly unmanageable from terror.

The special apprehension in regard to the introduction of the electric trains arises from the fact that they will be placed upon the turnpikes, which are necessarily the usual lines of communication in rural districts, and must, therefore, immediately involve the horses and cattle in the novel experience. It is also feared that the need of communication will lead to the immediate introduction of so many trains that the disturbance will be much intensified by the incessant repetition of the distressing noises.

By the changes of modern traffic many of these turnpikes, although not far removed from the greater roads, have become mainly the thoroughfares for the quiet country wagon or family carriage, and they cross at grade innumerable pathways, which are little used but by the placid cow and her barefooted driver. Into these quiet conditions the electric train is to be let loose like an unknown and dangerous force, encroaching upon the narrow limits of the road itself, and furnishing no defense which will prevent the bewildered cattle and horses from thrusting themselves madly into the very dangers from which they are striving to escape.

Turnpike companies, by stoutly demanding a sufficient price for the use of their roads, are erecting an obstacle against the introduction of the dreaded invention, and in many cases the farmers hesitate to accept the alluring promises of rapid transit in the well-grounded apprehension of the dangers which must arise from intruding the electric conveyances upon roads long used, and still essential to domestic prosperity for the transmission of farm produce.— Railway World.

Electric Signal Lights.

The use of electric lights in the place of the usual oil signal lamp has been experimented with in one or two places, and proved so satisfactory that the plan has been adopted in the extensive system of interlocking now being introduced at Stewart avenue, Chicago. In the regular plant a small dynamo is necessary for charging the storage batteries to be used in connection with the interlocking system, and while this plant was being installed it was decided to enlarge it sufficiently to supply power for electric lights to be placed on the switch targets. The same wooden boxing used for the wires in connection with interlocking is to carry those for the electric lights. Eighty-five lights are required for the signals, 12 for the signal tower, and 20 for the power-house, making 117 lights in all. The plant used for supplying the current for this work, says the *Railway Review*, must also be capable of charging 30 cells of storage battery used for interlocking, and it was therefore decided to use two Westinghouse 125-volt dynamos with a capacity of 150 lights each. These dynamos are both geared to the same shaft and the power for driving them supplied by two 25-horse power compound Westinghouse engines, so arranged that either dynamo may be driven by either engine. Steam is supplied to the plant by two 75-horse power boilers. The usual form of oil lamp casing will be used and the electric lamp be placed inside, so in case of failure the oil lamp can be substituted. The advantages in the use of electric lights in connection with signaling are evidently great, provided the work can be put in so as to preclude failures, and the experiment will, therefore, be watched with great interest by all signal engineers and others interested in the subject.

Useful Information.

Weight per Square Foot of Sheet Metal.

It will be interesting to those who have anything to do with sheet-iron boiler plate or similar material to have an easily remembered rule for finding the weight per square foot of material they are working with. It has been found by experience that a square foot of iron plate one-eighth inch thick weighed almost exactly five pounds, and this forms a basis for a very simple and easy rule. As a square foot of iron one-eighth inch thick weighs five pounds, a square foot of one-fourth inch iron will weigh ten pounds, and we can say that the area of any sheet iron (or plate iron) in square feet multiplied by the thickness in one-eighths and multiplied by five will give the weight of the piece. There is a piece of tank iron five-sixteenths inch thick, three feet wide and five feet long, how much does it weigh? The area will be 3×5 feet, or 15 square feet. Now, how many eighths is five-sixteenths of an inch? Since one-eighth equals two-sixteenths, and two is contained in five, two and one-half times, we say five-sixteenths equals two and one-half eighths, or two and one-half times five pounds, equals twelve and one-half pounds per square foot, and as there are 15 square feet, we have $15 \times 12\frac{1}{2} = 187.5$. Where the thickness is even eighths of an inch, it is much simpler; but even this is not a hard thing to do as shown. If it is desired to use this rule for other than iron, we simply find the difference between the weights of the two metals per cubic inch and find what a square foot one-eighth inch thick will weigh, then work as shown above. —Ironmonger.

What Zero Means.

The word zero is from the Spanish and means empty, hence nothing. It was first used on a thermometer in 1707 by a young Prussian named Gabric Fahrenheit, then but 19 years of age. From a very small boy he had been a close observer of nature, and in the years mentioned above, while experimenting by putting snow and salt together, found that it produced a degree of cold equal to the coldest day in the year. The young discoverer was struck with the coincidence of his little scientific discovery, and hastily concluded that he had found the lowest degree of temperature known in the world, either natural or artificial.

He called the degree "zero," and constructed a thermometer, or rude weather glass, with a scale graduated up from zero to boiling point, which he numbered 212, and the freezing point 32, because, as he thought, the mercury contracted the thirty-second of its volume on being cooled down from temperature of freezing water to zero, and expanded to the one hundred and eightieth part on being heated from the freezing to the boiling point. Time showed that this arrangement, instead of being truly scientific, was as arbitrary as the division of the bible into verses and chapters. Fahrenheit's thermometer became widely adopted before any one adopted a better scale, and those who now use it cling to it as Englishmen cling to their difficult and cumbersome fractional money. The three countries which use Fahrenheit's scale are England, Holland and America. Russia and Germany use Baumer's, in which the boiling point is counted 80 above freezing, zero. France uses the Centigrade, so called because it marks the boiling point 100 degrees from the freezing point.—Carriage World.

Paving Alleyways.

Philadelphia alleyways are to be hereafter paved with an improved patent pavement when declared defective in paving or drainage. The Board of Health has issued the following specifications for laying such pavements: All alleys five feet or less in width shall be excavated to the depth of 18 inches below the lines given by the surveyor of the district, the excavation thus made to be filled to the depth of 14 inches with clean cinders, well rammed. Upon this shall be laid a concrete, to be composed of one part of imported Portland cement (either of Hilton or Manheimer brand), three parts of clean, sharp, coarse bar sand, thoroughly mixed dry and made into a mortar with the least quantity of water and thoroughly intermixed with broken stone or approved furnace slag, in such quantity that when tamped or rammed solidly in place free mortar will rise to the surface and exhibit a depth of three inches of the said concrete. Upon this concrete foundation a surface shall be laid one inch in thickness, composed of one part of Portland cement (Dyckerhoff or Star Stettin brand) and two parts of crushed granite to pass through a $1\frac{1}{2}$-inch sieve, free of dust, with just sufficient water to make a mortar, to be thoroughly tamped solid to the lines and grade given by the surveyor of the district, and dressed with a small quantity of dryer, composed of one-half pure cement and one-half flint sand, floated over the entire surface as a finish.

Tropical Roofs

The natives of the interior of Ceylon finish walls and roofs with a paste of slaked-lime gluten and alum, which glazes and is so durable that specimens three centuries old are now to be seen. On the Malabar coast the flat bamboo roofs are covered with a mixture of cow-dung, straw and clay. This is a poor conductor of heat, and not only withstands the heavy rains to a remarkable degree, but keeps the huts cool in hot weather. In Sumatra the native women braid a coarse cloth of palm leaves for the edge and top of the roofs. Many of the old Buddhist temples in India and Ceylon had roofs made out of cut-stone blocks, hewed timber and split bamboo poles. Uneven planks, cut from old and dead palm trees—seldom from living young trees—are much used in the Celebes and Philippines. Sharks' skins form the roofs of fishermen in the Andaman Islands. The Malays of Malacca, Sumatra and Java have a roofing of attaps, pieces of palm-leaf wicker-work, about three feet by two in size and an inch thick, which are laid like shingles and are practically waterproof. The Arabs of the East Indies make a durable roof paint of slaked lime, blood and cement. Europeans sometimes use old sails—made proof against water, mold and insects by paraffine and corrosive sublimate—for temporary roofs.

Steam and Electric Railroads.

A writer in the New York *Sun* notes the fact that notwithstanding all the assistance given to corporations by legislatures, cities, counties, and private individuals, railroad construction in this country was very slow at first. In 1830 there were but 23 miles in operation; in 1832, 229 miles; in 1835, 1098; in 1840, 2818; in 1845, 4633, and in 1848, 5997. In no single year was the increase in mileage, which now averages 5000 miles a year, as high as 1000. But from 1849 to the beginning of the civil war, in 1861, the extension was rapid, the total mileage in 1861 reaching 31,000. Then construction languished until 1870, when 7000 miles were added, and now the total length is 215,000 miles. On the other hand, the electric railroads have increased with marvelous rapidity throughout every section of the country. At the beginning of 1890, when electric railroad building first began to be popular, there were 200 companies in operation, covering 1641 miles of track and using 2346 cars. To-day, so great has been the multiplication of lines that there are more than 7000 miles of electric street railroads. Three years ago, the mileage of horse roads was 5713; of electric roads 1641, of steam roads 554, and of cable roads 527. Now the electric roads lead all others.

What the World's Fair Buildings Are Covered With.

Inquiries are often made regarding the material with which the buildings of the Columbian Exposition are covered. This white, incombustible material is "staff."

Not only are the structures clad in staff, but the hundreds of columns, pediments, capitals and all the profuse, general ornamentation, as also the gigantic statuary groups and allegorical pieces, are all of staff.

Without staff, indeed, these enormous buildings would he impossible, at anything like the present cost. One may also say that without staff the Fair in its present aspects could not have come into existence.

This protean substance is a mixture of plaster—often called plaster of Paris—and a small per cent of cement, into which are introduced frequent fibers of hemp, jute, or Sisal grass, to give it toughness, so that it may be bent, sawed, nailed, or bored, at will.

It is cast in molds. The plaster and cement are first wet up to the consistency of thick treacle, a layer of which is spread on the well-lubricated mold. Next follows a layer of the long, tough fibers, over this is poured another coating of the liquid plaster, covering in the fiber and filling the mold to the required depth.

A Unique Way to Save Rails.

The latest practice in economy of rolling stock on railways is to turn the cars at the end of each trip, whereby a large percentage of extra wear and tear is saved, says *Iron Age*. Some years ago a portion of the Wabash railroad was laid with old English iron rails and a small part with steel rails from the Carnegie mills. It became necessary after a time to remove some of the main line rails to another part of the road, and it was observed that, after re-laying them, many gave out immediately, while others manifested no signs of wear. To determine the reason of this apparently unaccountable condition, an investigation was ordered, which showed that the road from which the rails had been removed was built in a northwest-southeast direction, and that in re-laying, a large number had been turned end for end. Those that had not been so placed exhibited no additional loss by attrition, while the turned rails succumbed in from 30 to 90 days. The conclusion arrived at was that the metal had become polarized from long use, when first laid, and that the fiber was broken up by the traffic in the opposite direction. It was further proved that cast-iron wheels generally yielded twice the mileage when the cars were turned at each end of the journey than when they were run backward and forward without reversing. Notwithstanding the value of this discovery, it was not universally utilized, and it is only recently that some of the American railroads have begun to recognize its importance.

NEW SCLEROMETRIC METHOD.—A new method of determining the hardness or friability of substances was described by Herr August Rosiwal at a recent meeting of the Vienna Academy. The measurements consist in comparing the losses of weight sustained by the bodies under investigation by scratching them with a given weight of polishing material mounted on a metallic or glass base until the material loses its efficiency. The polishing materials used were dolomitic sand, emery and pure corundum. The diamond was assigned its place in the scale of hardness by comparing its efficiency as a polishing material with that of corundum. It was found to be 140 times as hard as corundum. Tested by this method, the constituents of Mohs's scale have the following numerical values: Diamond 140,000, corundum 1000, topaz 194, quartz 175, adularia 59.2, apatite 8.0, fluorspar 6.4, calcite 5.6, rocksalt 2.0, and talc 0.04.

FASTENING EMERY PAPER ON WOODEN DISKS.—The following is a simple and practical way of fastening emery paper upon wooden disks or similar objects, says an exchange. Formerly the paper was fastened by means of glue, wax or some other adhesive substance. This involved delay, because the machine could not be used before the glue, etc., had dried, and, besides, the emery paper frequently peeled off when the working of the machine produced a high degree of heat. If the wood is covered with soap, preferably tar soap, without exerting any pressure, the emery paper then placed upon the wood and its working side rolled over a pipe or metal cylinder for the purpose of pressing it down with equal strength in all its parts, the paper will adhere with perfect firmness to the wood and not peel off, even if a very high degree of heat is developed.

TO DRAW RED LINES ON BLUEPRINTS. A correspondent sends the *Engineering News* the following method for producing bright red lines on blueprints. It is not new to many draftsmen, but, as we know from experience that it works beautifully, we print it for the general benefit of our readers: Make a saturated solution of carbonate of soda and add to it enough ordinary carmine writing ink, such as Stafford's or any other good quality, to make a mixture of desired color. Use this with pen, and let it dry without using a blotting paper.

A RIPE TOMATO will remove ink stains from the hands or from paper or linen. There is no particular knack about it. All that is to be done is to crush the tomato in your hands and rub the ink spot with the juice, then wash in clean water, and ink and tomato juice will come away together.

A NEW petroleum conduit pipe is to be laid alongside the railroad between Baku and Batoum at an estimated cost of 19 millions of roubles. The oil will be hydraulically pumped from the Casplan end into the Batoum reservoirs.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Educational.

Belmont School.

BELMONT SCHOOL, most delightfully and advantageously located 25 miles south of San Francisco, prepares for any college or school of science. The consolidation of the Hopkins Academy with it brings $56,000 to the $100,000 already invested, and so greatly adds to the resources of a school already well equipped as to place its permanence and its ability to offer the best and the broadest instruction beyond question. Twenty scholarships invite earnest and able young men of slender means. A gymnasium and athletic grounds, unsurpassed by those of any secondary school in the entire country, under the direction of the present physical instructor in Williams College, insure unexcelled physical training. The school invites inspection. References required. For Catalogue address, W. T. Reid, A. M. (Harvard), Head Master, Belmont, California.

HEALD'S

BUSINESS COLLEGE,
24 POST STREET.....SAN FRANCISCO.
FOR SEVENTY-FIVE DOLLARS

This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. ☞ SEND FOR CIRCULAR. E. P. HEALD, Pres. C. S. HALEY, Sec.

Mining Property For Sale.

A Drift Gravel Mine of 250 Acres at Forest City, Sierra Co., Cal.

Blacksmith shop and tools, T-rails for 800 feet of tunnel, 500 feet tunnel completed. Mine incorporated. For particulars inquire of the undersigned at Forest City.

QUICKSILVER

—FOR SALE BY—

The Eureka Company of San Francisco,

Rooom 1,

426 CALIFORNIA ST., SAN FRANCISCO.

WELL MACH'Y *All Kinds, Water, Gas, Oil, Mining, Ditching, Pumping, Wind and Steam: Heating Boilers, &c. Will pay you to send 25c. for Encyclopedia, of 1500 Engravings.* The American Well Works, Aurora, Ill. also, Chicago, Ill.; Dallas, Tex.; Sydney, N. S. W.

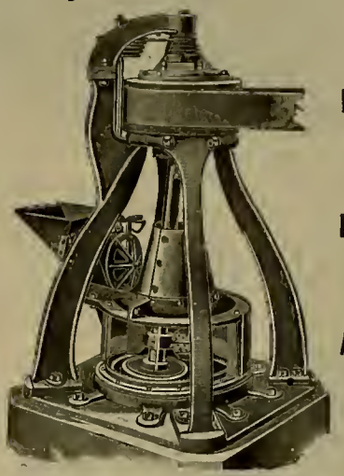
FOR SALE.

One Ohmen's 12 x 12 Automatic Engine; best style in use. Also, 1 Boiler 48 in. x 16 ft. Both nearly new. Apply to J. W. QUICK, 221 First St., (Top Floor) San Francisco, Cal.

THE GRIFFIN MILL

The Only Perfect Pulverizer

OF QUARTZ, GOLD OR SILVER ORES, PLUMBAGO, PORTLAND CEMENT,



OF PHOSPHATE ROCK, FOUNDRY FACINGS, And All Other Refractory Substances.

Will work either wet or dry, and deliver a finished product. Capacity, 3 to 4 tons per hour on Phosphate Rock, 1¼ to 2 tons per hour on Portland Cement, Quartz or Ores, depending on hardness of material to be pulverized and fineness of product. Grinds from 30 to 250 Mesh with equal facility.

NO JOURNALS IN GRINDING CHAMBER. BALL RIGID ON SHAFT HAVING DIRECT POSITIVE ACTION ON MATERIAL. MINIMUM POWER PRODUCES MAXIMUM AMOUNT OF PRODUCT. IT IS ABSOLUTELY GUARANTEED IN EVERY RESPECT, BOTH AS TO CONSTRUCTION AND CAPACITY. FIRST COST, WEAR, AND OPERATING EXPENSE MUCH LESS THAN STAMP MILLS. LARGE NUMBER OF MILLS IN USE ON DIFFERENT MATERIALS WITH POSITIVE SUCCESS IN EVERY INSTANCE.

Correspondence solicited, and illustrated descriptive pamphlet furnished on application to

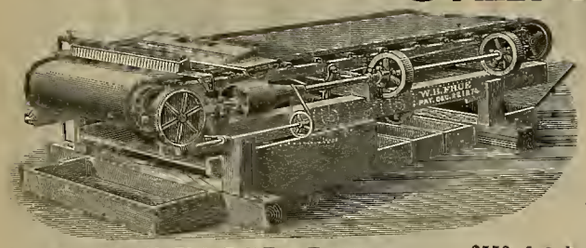
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), exteoding over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less lose in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

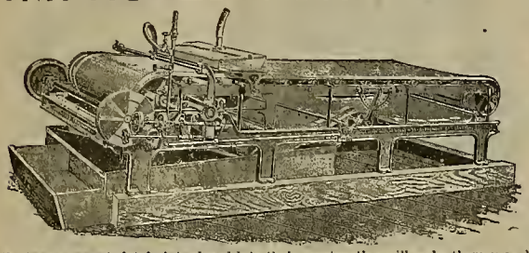
IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illustrates the **"TRIUMPH" CONCENTRATORS**, and shows the recent improvements which have been introduced into their construction, by which many advantages are gained over any other form of Vanners, Vanning Machines or Concentrators.

These advantages are obtained by reason of the fact, as will be observed, that the crank-shaft is now placed and fitted at the head of the Concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting rod and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brasses have also been very much improved, making them stronger, simpler and more easy of adjustment. Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all parts of the machine stronger, more accessible and as easy of regulation as is possible.

We furnish the "TRIUMPH" Concentrators with either the plain or "Blasdel" Riffled Belt and shall be pleased to quote prices with the adaptation of either, as may be requested, and shall further be pleased to show one of the improved form, set up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentlemen:—Following the testimonial letter which I addressed to you December 9th, 1890, in relation to the superiority of the "Triumph" Concentrators over either the "Frue" Vanners or "Woodbury" Concentrators for concentrating our Texas ores, I hold now to the opinion then expressed; and with nearly two years and a half further experience in their operation I can confidently assert and am more fully convinced than then, that the "Triumph" Concentrators are better in all respects than any other form for concentrating our Texas and Bully Choop ores, and in evidence of such confidence I refer with pleasure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) stamp mill at the "Cleveland Consolidated Mining Co.'s mines in Bully Choop Mining District in Shasta and Trinity Counties, this State, and I feel assured that the improvements lately introduced into their construction will make them even better than the old form which I have had in operation for so many years past in the different mills under my supervision. I am, very truly,

(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cons. Mining Co's.

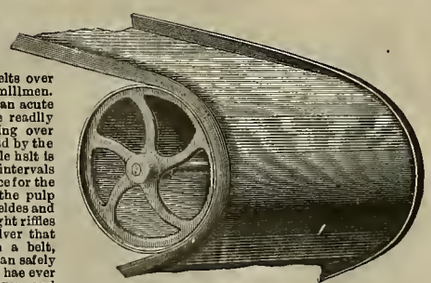
THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.



First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

PLYMOUTH.—First-class rock is being taken out of the Bay State mine at Plymouth. The next move of the company will be to erect a mill. Dr. Boyson spends considerable time in Plymoutb looking after the mining property which he is engaged in developing. It is understood that the Cliutou mine difficulties will be straightened ont rigbt away. The mill is still running. Snperintendent J. H. Tibbits was over from the Amador mine yesterday. He reports everytbing progressing favorably at the Albany mine and the general mining outlook over in that section as being very promising.

FROM IAMAVILLE.—W. Hipkins has got the new 60-foot gallows frame of tbe Irma frame in place, for whicb be deserves great credit. There are now 60 men employed at the Irma mine, with good prospects of soou doubling that number, as the company have three distinct ledges opened out and appear to meau bnsiness. This company has not beeu in existence one year yet and the mill bas been ronniug already two months ou bigh-grade ore.

AMADOR GOLN MINE.—*Ledger*, Jnly 28: Vincent Neale, representing the Jackson Gold Fields, Limited, which is the snccessor in interest to the Amador Gold Mine, Limited, arrived in Jackson last evening, prepared to redeem the Amador gold mine property, now beld by the Amador Gold Mine (the Americau compsny) upon purchase at Sheriff's sale. The mine and mill is well fortified by armed men, but the complicated condition of affairs will, no doubt, be peacefnlly adjndicated under the direction of the Snperior Conrt and the Sheriff's office. James E. Dye, wbo for several years acted as financial agent of the Amador Gold Mine, Limited, will arrive in Jackson this evening from London to resume his old position.

Calaveras.

DEMARTINE'S MINE.—*Mt. Echo*, Jnly 29: We were sbown some specimens of ore from the DeMartine mine, situated in Bear Mountain, some five or six miles from Angels, that are abont as rich as any qnartz we bave ever seen. The mine from wbich these specimens are taken has been worked off and on for the past 10 or 12 years, and a great deal of money has been taken ont of it. It has been worked for about 600 feet near the surface and prospected well the entire distance. The lead is four and a half feet in width, and grows larger as depth is attained.

THE MOSEA MINING CO.—Calaveras *Chronicle*, Jnly 29: One day this week, in company with W. T. Harris, the general superintendent and manager for this compauy, we paid a visit to the mine, which is now being operated, on Tunnel Ridge about two miles from this place. The mine has now been in operation about seven mouths, and the result of the developments so far made are extremely flattering. The main tunnel, which is 350 feet in length, cnts the ledge at a depth of about 100 feet and shows a fine body of ore about seven feet in width. Five levels have been run np to the present time, the ore enconntered in all of them being of about the same quality and richness. As far as developed the pay chute is now 300 feet in length and dipping towards the north. There is an eight-stamp mill on the mine, run by water power, with a capacity of 20 tons every 24 hours. The mill is supplied with a Heudy rock breaker and an automatic ore feeder. There are also in operation at the mine two of the new Tulloch concentrators. The ore in the mine will average about $6 per ton, while the sulphurets will go as high as $140 to the ton. When it is taken into consideration that the rock can be mined and milled for $1.50 per ton, even if the ore should not contain a very large percentage of snlphurets it would be a paying proposition. From the developments thus far made everything goes to sbow that it is a true fissure vein and one that will increase in richness as deptb is attained. Mr. Harris, the superintendent, is a man noted for his energy and good business qualifications, and in addition to this he is a practical miner of 20 years' experience, and we believe the operations he is at present conducting will provs a successfol venture to all interested. There are at present 12 men employed in and around the miue.

El Dorado.

ORO FINO.—El Dorado *Republican*, July 27: It is reported that as work progresses at the Oro Fino mine the new managers are receiving more encouragement than resulted from the first run made in the mill after the mine changed hands and it was repaired. The amalgamating plates being new, it is said that mnch gold was not retained ou the first trial and that subseqnent results are better. Work on the chlorination plant is being pushed ahead.

Inyo.

GOON GOLN PROSPECTS.—Inyo *Independent*, July 28: Snpervisor Wilson was in town this morning. He reports tbe roads all right in his district. The river is running over the Lone Pine bridge, but as the structure is a very substantial one, there is no danger of its going out. Mr. Wilson says tbat quite a party will soon go into the Beveridge country, where some excellent prospects have recently been opened up. The Oorrasco boys and Jim Stansbury have just concluded a rnn of gold ore in the steam arrastre at the old McEvoy mill and made a good cleanup. Mr. Wilson will keep the arrastre running and will probably start the mill. The ruinous depreciation of silver has the effect of stimulating gold mining to a greater degree of activity. The miner must work or starve, and as silver is comparatively valueless the old gold-fields will be thoroughly prospected over.

BACK FROM INYO.—Walker Lake *Bulletin*, July 27: W. N. Cook, of the Central mine, returned Sunday from Inyo county. He says that the conntry in the vicinity of Bisbop is now a beantiful sigbt. Mr. Cook made several prospecting trips into the monntains of Inyo. He is of the opinion that it will some day prove to be a big mining region. But very little mining has ever been done tbere, and he says the general formation is favorable for qnartz ledges. Mr. Cook's jndgment on a mining proposition is second to none.

Nevada.

THE DAISY HILL TO START UP.—Grass Valley *Telegraph*, Jnly 28: All arrangements have been made for the resumption of work on the Daisy Hill quartz mine at this place. Tbe mine is situated between the Empire and the Centennial, and years ago paid well. Just what will be done immediately is not yet known. Mr. C. H. Taylor, a young man of ability and sound sense, and son of our townsman, M. C. Taylor, will be the superintendent. Mr. Taylor is a mecbanic in the first rauk, is a thorough bnsiness man, and will no doubt run the affairs of tbe company to their entire satisfaction. Tbe Daisy Hill bas a splendid record and the company now about to work it have all the capital requisite and necessary. The principal mover in the matter of the opening up of the Daisy Hill is Mr. Roberts, a successfnl mining man, now operating mines in El Dorado county.

MINING IMPROVEMENTS.—Snperintendent Geo. Mainhart informs us that he is making some important improvements at the Lone Jack mine. A new line of pumps are being put in clear to the bottom, and they consist of two six-inch pumps and one eight-inch pump. A pump bob is being put in place and a Peltou water-wbeel will be added.

PROPERTY BONDED.—Mr. Mulcahey has a large qnartz vein on his ranch near Newtown, and considerable of the rock has been taken from the ledge and assayed at different places. The result of the assay has always been flattering, so much so that A. Bnrrows has bonded the mineral deposit, also the entire ranch, as besides its productiveness in grain and fruit there is a vast amonnt of valuable timber on the premises. Mr. Burrows is in San Francisco, and it is understood that he is making arrangements for starting active operations upon the mine immediately.

NO CLEANUP.—Onr several contemporaries published an item to the effect that the Seven Thirty mine had recently made a cleanup of ore paying very good indeed. Such is not the case, as we are informed by Geo. Taylor, the superintendent. There has been no cleanup on tbe last run of ore and the mill has been idle for several days ou account of a scarcity of water for running the mill. Mr. Taylor thinks, however, when he does make the cleanup that the yield of gold will more than verify the figures quoted by our contemporaries.

A RICH STRIKE IN THE BALTIC.—Nevada City *Herald*, July 28: Snperintendent Joseph Snyder of the Baltic mine ou Saturday afternoou brought to town a small sack of ore containing two or three pounds, which was literally filled with gold, says the Grass Valley *Union*. Mr. Snyder picked up about a panfnl of the ore from the stope jnst opened up about 700 feet in from the mouth of the tunnel and 160 feet in depth from the surface, and was surprised when he fonnd that he had about $35 or $40 in the pan. The specimens were placed in the Citizens Bauk, where they are now on exhibition. There is a ledge in the stope varying in size from six inches to a foot and a half, and free gold is freqnently seen. All the ore looks well. There is considerable ground opened up, and Superintendent Snyder is keeping right along opening up more. The new five-stamp mill will be completed some time this week, and the crnshing of the 60 or 70 tons of ore on the dnmp will be commenced. There is every indication that tbe stockholders of the Baltic will soon cease paying assessments and receive dividends instead. There are about 12 miners at work at the Baltic at the present time.

A MINE BONDED.—Grass Valley *Telegraph*, July 29: The Holdeworth mine, near Bowman's Dam, is bonded in tbe sum of $100,000. Mr. Joseph Holdeworth has owned the mine for years and himself and son have been working on the claim from time to time. Several years ago the owners of the mine gave rock to parties who wanted to purchase mining property, and so pleased were they with the prospects thst they have bonded it in the sum above stated. Messrs. Roberts & Semm have bonded the property. Mr. Roberts is an expert miner and is engaged in mining all over California. It was not long ago when the gentleman went to China to superintend the erection of mining machinery and his venture was a most successful one. For years "Dock" Holdeworth has been carrying his qnartz to Bloomfield on his back, a distance of about 18 miles, and when he crushed or assayed the results were more than he expected.

RUNNING SMOOTHLY.—*Transcript*, July 29: The machinery at the Reward mine was started up Monday for regular work. Everything about the works runs smoothly and the sinking of the shaft is progressing as rapidly as can be expected. The ground they are at present running through is very dangerous, requiring the most careful timbering. When this bad ground is passed the work will be rushed ahead. The Reward machinery is driven by steam and the whistle can be plainly heard in town.

NEW GRAVEL MILL.—Nevada *Herald*, July 28: Oscar Brown is almost through with the new mill at the Kate Hayes mine, French Corral, and is now building a tramway for it. The mill is a heavy one with ten 1000-ponnd stamps and a six-inch cam shaft. It is calculated to grind np the cemented gravel which escapes the elevator in a thorough manner. Mr. Brown expects to have the mill ready for business by the 10th of August.

Placer.

MICHIGAN BLUFF.—Colfax *Sentinel*, Jnly 29: More men have been put on at the Turkey Hill of late. It has been reported here that there bas been a sale of the Morehead mine at Deadwood. There is a full crew at work again at the Old Mexican. A double shift (night and day) is pusbing things at present.

FORD MINE.—Work was suspended on tbe Ford mine for a few days. They expect to start up again soou with a large force of men. Things are running at full blast at the Pioneer and Dorer mines.

FOREST HILL DIVIDE.—Tbe Breece & Wheeler mine at Bath is working a good force of men. The miue still continues to look well. On Sunday afternoon we took a drive out to tbe Mayflower mine. Here we found one of the liveliest little mining camps in the whole county. Tbere are some 70 or 80 men employed at the mine, and everything is in tip-top sbape. The gold output still contiuues, and the mine has a bright fntnre. Tbe tunnel is in now abont two miles.

Plumas.

LABOR NUGGETS.—Plumas *National*, Jnly 22: Last evening, Lewis Bell showed us several large gold nuggets taken from his mine at Emigrant Hill last and this' week. One piece weighs $26, another $17, and numerous others weigh $10, $5, etc. He has a shaft down 50 feet, and in drifting off from it broke into tbis rich bed of gravel, which is apparently situated between two layers of bedrock, having an inclined position and being several feet apart. The gold is most peculiar in appearance, having a dark, rusty-looking coating. Mr. Bell thinks he has a bonanza. The channel is considered a part of that which supplied tbe gold fouud in Newtown Flat. Mr. Bell has already taken out a handsome lot of coarse gold, and will doubtless secure much more, thongb his limited means compel him to work to a great disadvantage.

IMPORTANT DEVELOPMENT.—On Saturday, M. E. Sanborn, ex-district attorney of Sutter Co., arrived in Qnincy, and on Monday proceeded to the Pilot Hill mine near Onion valley—a property in which he has beeu interested for several years, and on which very important developments have beeu made lately. The Pilot Hill quartz mine is sitnated near the head of the south fork of Poorman's creek, close to Pilot peak, about one mile from Onion valley. Recently, several small "stringers" close together were discovered and found to be very rich. Two shafts, each ten feet deep, were sunk and samples of ore taken from the bottom. From one assay made by Prof. Hanks, of about 20 pounds of the ore, he reported the yield per ton to be $655 in free gold and $360 in the sulphurets, thns making the total yield per ton to be $1015. By a fire test (small of course) the yield was $700 per ton. Another assay of samples sent by Mr. Sanborn to his brother in Denver yielded $1500 per ton. This small ledge is immensely rich, and the prospecting now going on indicates that a solid, permanent and extensive body of ore will be developed. This location covers 3000 feet. By means of small shafts, it has been traced on the surface 250 feet, and at all points good prospects are found. The company now has a tunnel in 40 feet on the line of the ledge. They propose to develop the property themselves, and they have great confidence in the fnture of it. With a tunnel not over 1000 feet long, the mine can be tapped at a depth of 800 feet. Near the Pilot Hill the company has another mine—the Plumas—3000 feet in length. An assay of the ore from this yielded $57 per ton. These properties are situated in a gold-producing country—that which fed Poorman's creek, one of the celebrated mining camps in the early days of placer mining in California.

RICH GULCH MINES.—Cor. *National-Bulletin*, Jnly 27: Your correspondent spent two days of the present week on the East Branch. I found the old resident miners of that well-known section busily engaged in their life-time occupation of mining. I was made aware that the diggings were no longer worked, but that the sources whence came their immense yield have now claimed the attention of the inquisitive few, whose reasoning faculties prompted them to seek the fountain-head from which flowed the golden stream that gave fame to Rich Gulch, Dingbat and Terry Hill, Terry Riffle, Ohio Point, 12-Mile Bar and other camps near by of lesser note. These mines, in the earlier days of mining, yielded vast amounts of gold, and the mother lode, in one immense, compact, defined body of quartz, as here found, is conceded by all who are acqnainted with, and by those who visit it, to be parent to all the richness of the lower lying surface. The lode follows the strike of the rock closely, running northwest and southeast. The altitude is over 4000 feet, the river, by its windings, crossing it twice, and cutting it to a depth of 2200 feet. On the Hallstead mine, consisting of four full claims, there have tbus far been found six chutes, all having a uniform dip to the west, or with the ledge. Their average width would perhaps be 60 feet, with a showing of free gold the entire width, the rock also being rich in sulphurets. The lower lying claims on the east, three in number, are owned by Mr. Duncan of Oroville. On these claims the immensity of the lode is fully shown, and full proof of permanency is here presented. At a depth of over 2000 feet (the height attained on the Hallstead mine), the ledge runs in width from 20 to fully 100 feet, a presentation of chutes being observed the same as seen on the higher ground already described. The prospects in free gold, obtained in my presence, were certainly very rich, and, thongh taken at raudom, showed uniform richness throughout. Tbe ledge is claimed for a distance of nearly three miles continuonsly. At the Fred Lewis mine on the upper end, the ledge is more or less stratified, with interlying areas of soft slate carrying free gold in liberal proportions, immense quantities of solid qnartz being freqnent. Mr. Lewis gives his whole attention to the smaller veins, from wbich, with a very crude one-stamp mill, which is run by haud, he extracts much gold, and is fully contented, not seeming to realize wbat a grand sbowing he has for a fortune if only he had a large plant ou bis property. This lode, from the East Branch to Deadwood creek on the west, represents what will undoubtedly become one of tbe greatest and richest quartz propositions in tbe State, when capital is once secnred and beavy plants are erected. The advantages for economical working were never superior in any other place—immense backs of over 2000 feet, to be obtained by running straight ou the lode from the river side; with forests of the finest sprnce and pine timber covering not only the surface of the location, but the snrrounding country as far as the eye can see; and, greater still, is a perpetual water supply, owned by Mr. Duncan. Rush creek fnrnishes the supply, which is conveyed in a ditch three miles long, with a capacity of 2000 inches. Tbe fall to be obtained at the lowest mill-site is 425 feet—a power sufficient to drive 1000 stamps. An inspection of tbis property will verify every word used in this hurried description. The Hallstead Bros. are now engaged in running a tunnel on the ledge, by which they are developing an immense chute of very rich rock, from the surface of which large quantities of good ore were taken. Tbe ledge on the surface is here 42 feet wide, and, at the present depth of their tunnel, 130 feet. The width is yet unknown. The rock at this depth shows free gold, evenly distributed, and is very rich.

San Bernardino.

VANDERBILT DISTRICT.—Pioche *Record*, Jnly 27: Deputy Recorder Harrison yesterday received a letter informing him that articles of incorporation of the Keystone mine at Good Springs had been forwarded to him for record. The amonnt of stock and names of officers are not known, as the papers have not yet arrived. The company have let a contract to haul 1000 tons of ore from the mine to the terminus of the Nevada Southern railway, near Vanderbilt. The Gold Bronze mine in Vanderbilt has been sold to Haggin & Tevis, the great California capitalists, for a large snm. Preparations are already being made to do an extensive amount of work on the mine. This is indeed good news for that section, as the incorporation of the Keystone and the interesting of such men as Haggin & Tevis in the mines means work for hundreds of men and conseqnent prosperity to the camps. A telegram from Needles states that $450,000 of bonds of the Nevada Southern railway branch line have been sold in New York City, and it is thought work will be pushed on to Good Springs and Pioche at once.

San Diego.

AT JULIAN.—*Sentinel*, July 27: S. L. Ferguson and W. Wilson had a clean-up Tuesday from a small crushing of ore taken from the Van Wert and Grand Central mines, which went $20 a ton. Considerable quantities of phenomenally rich rock have recently been struck in the Cbaparral mine, and are now being taken out. R. G. Melrose reports having taken out a lot of quartz from his mine on Boulder Creek. Seven shipments of bullion, some of them of considerable magnitude, were made from here dnring the past two weeks. We saw wood and say nothing, but at the same time we can't help thinking that we are adopting the right method of solving the financial question. Great are hammer and drill and miners' muscle.

BOULDER CREEK DISTRICT.—About a year ago a mining location was made by N. H. Campbell and others on Boulder Creek, about six miles west of Stonewall. Considerable work has been done from time to time since then, and very little said about it. Mr. Campbell has had a large amount of experience aronnd various mining districts, and is one of the best judges of ore and general mineral indications in the camp, and knows gold-bearing ore when he sees it. The formation and general characteristics are different in this location to what exist in the other mines in this district. The ledge is between porphyry walls, is about three feet wide, and shows the mineral ash on which mining experts rely for reliable croppings. The ledge can be traced for over a mile over the mountain. Very rich specimens of quartz have been taken out, and all the ore prospects good. There is abundant water power at hand, which may be required for working the mine, and all other necessary facilities are convenient.

Sierra.

WILL PROBABLY START.—*Mt. Messenger*, July 29: We learn that there is a good prospect of the Union Consolidated mine, at Happy Hollow, starting up again. They will run a new tunnel for a piece of ground they were unable to work through the old one, and which is known as "Number eleven."

Siskiyou.

UNDEVELOPED GROUND.—Yreka *Union*, July 29: It is very evident that new movements are being made in mining matters, and that new capital is being invested in that direction. We see this, in some cases, in our own county, Siskiyou, where open and partly developed rich mines have lately been bonded. This is particularly to be seen in the Humbug district, a short distance from Yreka. We take it that Siskiyou and other closely neighboring mining

counties yet offer a big field of undeveloped mining ground, where capital and labor may find rich profit from investment. Of this, there is not the least doubt.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia *Chronicle*, July 24: 1500 level—On the sill floor have reopsned the main south drift a distance of 40 feet; total length reopened, 80 feet—a distance of 256 feet from the main shaft. 1600 level—At the end of the east crosscut from the main south drift (77 feet out) at the point whsre it connects with the upraiss which was carried up to the north drift on the 1500 level, the south drift has been advanced 15 feet; total length, 58 feet; in porphyry and quartz of very low assay value. Have continued the work of hulkheading and closing the openings which connect with the old stopes in the north end of the mine where gas exists, and the escape of the gas is growing less. 1650 level—Have continned making necessary repairs to the drifts on the sill floor of this level. No ore has been extracted during the week, but the work of extracting will he resumed in a day or two.

OPHIR.—1565 level—The crosscut running east from the winze station on the sill floor of this level has been extended during the week 14 feet; total length, 168 feet; continuing in a harder porphyry formation showing clay separations. Have resumed (jointly with the Mexican Compauy) the work of making repairs to the main shaft.

MEXICAN.—On the 1565 level—The east crosscut from the nortb drift from the crosscut run east from the bottom of the winze, has been extended 20 feet; total length, 135 feet, in a porphyry, clay and quartz formation showing a little value. 1465 level—Have completed making repairs to the nortb lateral drift. Have resumed (jointly with the Ophir Company) the work of making repairs in the Ophir shaft.

UTAH.—340 level—The south drift from west crosscut No. 3, at a point 100 feet in from its mouth, has been extended 15 feet; total length, 29 feet; continuing in quartzite and porphyry formation of low assay value.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 16 feet, making the total length 503 feet; the face is in clay porphyry. The joint Sierra Nevada and Uniou west drift, 900 level, bas been stopped aud a north drift started at a point 1520 feet west of the shaft.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been stopped and a north drift started at a point 1520 feet west of the shaft.

ANNES.—On 420 level—We have started east crosscut from north lateral drift to counect with south drift from east crosscut No. 1 nortb and advanced same 12 feet; face in quartz of low assay value.

GOULN & CURRY.—200 level—West crosscut No. 5, started in northwest drift, 432 feet from main west drift, has been advanced 5 feet; face in hard porphyry; total length, 550 feet. Sutro tunnel level—The joint uorth drift, which was started in east crosscut, 75 feet from main north drift, has been advanced 18 feet; total length, 64 feet; face of drift in vein matter.

BEST & BELCHER.—200 level—The north west drift has heen advanced 18 feet during the past week; total lengtb, 300 feet; face in soft porphyry. 900 level—West crosscut No. 5, started in southwest drift, 100 feet from west crosscut No. 4, has beeu advanced 14 feet; total length, 28 feet; face in hard porphyry. Sutro tunnel level—The joint north drift, which was started in east crosscut, 75 feet from main north drift, has been advanced 18 feet; total length, 64 feet; face of drift in vein matter.

HALE & NORCROSS.—On 900 level have advanced the south drift 21 feet; total lengtb, 131 fest; face in porpbyry. 1100 level—Have advanced tbe south drift 30 feet; total length, 128 feet; face in porphyry. Main shaft—Have completed retimbering the main shaft, and will now have to ease the timbers at different points between the 1000 and 1100 levels. During the past year the three compartments of the main shaft have been retimbered from tbe 1300 level up to within 320 feet of the surface, from which point considerable repairs were made but not thoroughly retimbered. In main incline we continue making necessary repairs between tbe 1300 and the Sutro tunnel level.

POTOSI.—The south drift, 35 feet west of the main shaft on the 850 level, is out 193 feet; face is in soft porphyry. The east drift, 73 feet above tbe 930 level, to connect with north raise from 930 level, is out 60 feet; face is in hard porphyry. Have started an upraise from the 8th floor of the south stope, 1000 level, to connect with south drift on 930 level, which is now up 14 feet; formation porphyry and bunches of quartz that give fair assays. Extracted and sent to the mill the past week 557 tons and 750 pounds of ore from the 550, 930, 1000 and 1150 levels. Milled during the week 555 tons. On hand at mill 160 tons and 1000 pounds. Average battery assays, $22.77; average car sample assays, $22.81. Shipped to the U. S. Mint, Carson, 437 pounds crude bullion.

CHOLLAR.—Are retimbering the main tunnel on 250 level and repairing the main incline between the 930 and 1200 levels. The west crosscut from the north drift from the east crosscut near the south line, 930 level, is out 58 feet; face is in soft porphyry and clay.

WARN SHAFT.—The station at the 820 level has heen completed and a drift started west which is now out 15 feet from the shaft.

EXCHEQUER.—The station at the 820 level of the Ward shaft has been completed and a drift started west which is now out 15 feet from the shaft.

ALPHA.—The station at the 820 level of the Ward shaft has beeu completed and a drift started west which is now out 15 feet from the shaft.

BULLION.—The station at the 820 level of the Ward sbaft has hsan completed and a drift started west which is now out 15 feet from the shaft.

OCCIDENTAL.—From the west ledge on 300 and 400 lsvels we are extracting and milling about five tons of ore per day of the average value of $26 per ton.

YELLOW JACKET.—We continus to work on tbe 1200 level, and havs crossed the vein on that level. Are now drifting south to a point to intersect the winze coming from the 1100, which is now down 60 feet. Tbe south drift from No. 2 crosscut on the 1100 level will connect to-morrow with the joint crosscut run by the Yellow Jacket and Kentuck, which will give a fine circulation of air on this level, and enable us in a few days to start an upraise in tbe ore. Rspairs have heen made to the incline of 1300 level, where we expect shortly to run some crosscnts to prospect the southern portion of the ground lying between the Yellow Jacket incline and the Kentuck line, which heretofore has never been explored.

Peavine District.

SPLENDID RETURNS.—Reno *Gazette*, July 29: Henry B. Rule and associates had an assay made of the rock brought in from his newly located claim on the side of Peavine mountain Friday night. The assay went $222 in gold, $53.20 in silver and 25 per cent copper to the ton. The *Gazette* believes that Mr. Rule has uncovered a bonanza that will attract the attentiou of the world before another year goes by. That Peavine is pregnant with precious metals no one doubts.

Bald Mountain District.

GOLD MINES.—Eureka *Sentinel*, July 29: Assessor J. G. Powell, accompanied by Dr. J. R. N. Owen, returned last Monday from a trip over to Bald Mountain, in White Pine county, where they visited some of the gold mines in that locality. Among others they mention the Lone Star mine, owned by Clay Simms and and Luther Clarke of this place, and say that the ore vein lies between porphyry aud granite walls and is four feet wide, and the ore will average at least $20 per ton. Dr. Owen of this place also has a very promising gold mine some four miles from the Lone Star mine. There are a large number of Placer mines about Bald Mountain, hut on account of the scarcity of water they can only he worked about one month during the rainy season. Water can be obtained the year round to supply a 20-stamp mill. Mr. Powell thinks Bald Mountain will come to the front in the near future.

Pioche District.

PROSPECTING.—Pioche *Record*, July 29: Quite a number of the men lately employed in the mines here have taken to prospecting, and it would not he surprising if some good discoveries are made.

ARIZONA.

HARQUA HALA SOLN.—S. F. *Chronicle*, Aug. 3: Negotiations for the sale of the famous Harqua Hala mines in Arizona to an English syndicate, which were interrupted by tbe death of George W. Bowers, have been carried to a successful termination and the last payment of the purchase price, which was $1,250,000, bas been made. Through Wells, Fargo & Co. Tuesday, $475,000 were paid on the order of Curtis H. Lindley, who represents the Eoglish syndicate. Of the total amount paid, the widow of George W. Bowers receives $500,000. A like amount goes to his surviving partner in the mine, A. C. Hubbard, and the promotors who engineered tbe sale divide the remainder. Mr. Hubbard, who has been staying at the Occidental for some time past, left immediately after the sale for Arizona. Mr. Lindley will meet him there and the transfer of the property will be made to the new owners. Just prior to Mr. Bowers' death negotiations had been almost consummated for the sale. An announcement by telegraph from Harqua Hala reported the actual sale. This apparently was a presumption from the knowledge that negotiations were in progress. At that time it had been stated that $70,000 had been paid on the mines. During the four or five months preceding his death Mr. Bowers is said to have received some $60,000 in dividends from the mine. The celebrated Harqua Hala mines are situated in Yuma county, A. T. They were located by Harry Walton, Robert Stein aud Mike Sullivan in 1888. Subsequently Stein's interest was transferred to A. C. Hubbard and Walton and Sullivan disposed of their interests to other persons. The Golden Eagle, one of the group, was jumped by a man named Horne. This resulted in a protracted and expensive litigation. Bowers bought out Horne and finally obtained a half interest in the mines. The Harqua Hala properties are located at two distinct camps, Harrisburg and Bonanza. Upon the properties coming into the possession of Bowers and Hubbard a large stamp mill was put up and all the facilities for crushing the ore arranged for. Great hoisting works were erected and the mines soon had one of the most complete plants in the West. The cost of milling the ore was reduced to $3 a ton. The wealth of the Harqua Hala mines is difficult to estimate. Immense ingots of gold have been received here for the past year and a half from these mines. On January 19th there arrived what was termed "the dome of gold." It weighed 309 pounds, and its value was placed at $81,200. It is claimed that there is an immense body of rich ore in sight, and that the prospects of the properties are better now than ever. When Mr. Bowers desired to buy an interest with Mr. Huhhard in the mines he did not have the ready money with which to make the purchase. He appealed to his brother, John T. Bowers of this city, and together they secured a loan of $45,000 from Wells, Fargo & Co. It is said that a large portion of the proceeds of the sale to the English syndicate will he invested in San Francisco realty.

MONTANA.

COPPER PROPERTIES ACTIVE.—Butte *Inter-Mountain*, July 29: Among the copper producers of the district tbs week has been a fairly active one. All the big copper concerns are employing the usual numbsr of men. At the Anaconda it is said 750 cars of ore are being hoisted daily, which would indicate that tbe force at this mine has been but slightly reduced. One of the most cheering signs of the times is the improvements and additions now being made at many of the copper-producing properties. F. A. Heinze, who has already expended a large sum of money in making additions to his smelter, has announced his determination to erect a 300-ton concentrator adjoining the smelter, and the work of excavating for it will he commenced about the middle of August. The new addition to the Heinze smelter is fast nearing completion and on next Monday tbe Western Iron Works of this city will begin placing the two converters in position. The building has been made large enough to accommodate four converters, hut for the present only two will be put in. Two reverbatory furnaces, a blast furnace and one O'Harra will also he added to the smelter. The foundation for a new air compressor has also heen laid and the compressor and engine, size 20x42, is now heing constructed by the Cbicago Iron Works and will arrive in a few weeks. The smelter is treating about 110 tons of ore per day and 200 tons of ricb copper matte is shipped each week to New York. Nearly all of this ore is being obtained from the Rarus and Glengarry. One thonsand tons of concentratiug ore was shipped during the past four days from the Rarus to tbe Liquidator concentrator, which is being operated by Mr. Heinze. The copper mines of the Bostou & Montana Company are all in operation. Sinking is still in progress at the West Colusa, the shaft now being developed to a depth of 560 feet. At the 600-foot level connections will he made with the 500-foot level of the Leonard. The West Colusa is considered the best of all the Boston & Montana properties. The ledge is said to he from 40 to 50 feet in width, and increasing in size and quality as depth is attained. At the Leonard shaft the mammoth Corliss pump is now in operation and working to perfection. This pump is considered vastly superior, hoth in economy and ease of operation, to the ungainly Cornisb pump. The Colusa properties handle an enormous quantity of water and it is expected that as new ground is opeued up and the work of development progresses the quantity of water will be much larger thau at present. A fine assay office and a new blacksmith shop are now in course of erection at the Leonard. With the exception of the Silver Bow mill, all the properties of the Butte & Bostou are in operation. The output of the mines and smelter bas been increased recently and the outlook for the future is very promising. A great number of men have left the city since the drop in silver. Some of them have gone on a visit to friends in the Eastern States or in the old country, while many more have gone on prospecting expeditions to various portions of the State or Idaho. The Highland mountains and other gold districts are overrun with prospectors just at this time. Many of the gulches in the vicinity of the Highlands are filled with gold, which, with water in ahundance, would pay several dollars per day per man. But water is very scarce where placer gold exists just now. North of Walkerville a number of men are engaged in placer mining and are said to he meeting with very good success.

NEW MEXICO.

GOLD MILLS AT WORK.—Silver City *Enterprise*, July 28: The recent rains bave furnished an abundance of water for all the mills at Pinos Altos, and they are all pounding away on rich ore from the gold mines of the camp. The company which has heen working the old Black Hawk mine, under the superintendence of Prof. E. M. Hand, paid off in full last Monday. Operations will be suspended until there is an advance in silver. The Manhattan tunnel near Pinos Altos is now in 765 feet, and it is expected any day now to strike the vein. When the vein is reached this will be another added to tbe uumber of producing gold mines of Grant county. O. Bailey has suspended work on the Liviugstone mine, in the Burro mountaius. The mine prodnces rich ore, but at present low prices of silver it will not pay to extract it and deplete the ore reserves at so little profit. Tbe Sheridan mill at Cooney, in the Mogollons, is being put in order to run the ore from the Little Fanny mine. The shaft on the Little Fanny is down 800 feet, and has a big body of rich ore from top to bottom. The ore in the bottom is as rich as any ever taken out of this famously rich mine. Wm. Walker has leased the Western Belle mine at Gold Hill. He has rented the Standard mill and will start crushing ore next week. Charles Knuckey, an experienced miner, is in charge of the mine, and there is no doubt that it will he a good paying proposition for all concerned.

Mining Share Market.

The stock market has had, perhaps, a little hetter tone this week than last, hut this is not saying very much. Several heavy assessments have been levied this week on prominent mines, as follows: Belcher, 25 cents; Ophir, 25 cents; Chollar, 10 cents; Yellow Jacket, 25 cents; Eclipse, 25 cents; Waterloo, 15 cents, and Segregated Belcher and Andes Cons. 10 cents. The delinquent lists of several other mines recently advertised string out to amazing proportions as published, which gives an unpromising future for the collection of money on these new assessments. The proposed draft of miners this week on the Comstock will leave only ahout 200 men on underground work, and it is threatened that even these will he taken off if the Miners' Union does not accept the 20-per-cent reduction of miners wages.

More of the Comstock mining companies met Monday, including the Ophir, Belcher and Chollar, and reduced the salaries of their officers from 25 to 50 per cent. Advantage was taken hy the companies named of the opportunity to levy some assessments, as they were in debt.

The Bodie *Miner* reports everything very quiet in Aurora, little or no work heing done and only a few of the old-timers left. The financial crash has affected the English syndicate that intended to take hold of mines in the district and nothing will he done at present.

The San Francisco Stock and Exchange Board is receiving many letters of inquiry from people interested in gold mines since it decided to list gold-mining stocks upon the payment of the annual dues of $100, waiving the usual charge of $500 for listing. Two mines have thus far heen listed.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 4, 1893.

500,988.—ROTARY ENGINE—W. W. Andrews, Fallbrook, Cal.
500,839.—DISPLAY STAND—M. Anthony, Berkeley, Cal.
500,702.—CULTIVATOR—D E Barton, S F.
500,991.—SPLINT BASKET—G H Carlson, S. F.
500 993.—BUTTON-FASTENER—E. Christensen, Portland, Ogn.
500,853.—STREET-SPRINKLER—C. A. Clark, Portland, Ogn.
500,856.—PUMP—C. S. COX Spottiswood, Cal.
500,867—BEDSTEAD—J. J. Dugan, Salem, O n.
500,874.—LAND-LEVELER—Wm Falconer, Selma, Cal.
500,877.—AIR MOTOR—J P. Foulks, Verdi, Nev
500,836.—SMELTING FURNACE—J. L. Giroux, Jerome, A. T.
500,888.—GAME—A. M. Grubbs, Forest Grove, Ogn.
501.008.—TILE FRAME.—H. Hanstein, S. F.
500,766.—PAPER PRESS—W. F. Hess, S. F.
500,903.—CABLE RELEASER—A. Jeffreys, S. F.
500,910.—AIR BRAKE—W. Keywood, Tacoma, Wash.
500 935.—GAS GENERATOR—Jas. Nolan, Oakland, Cal.
500,946.—HORSESHOE—S. Pruden, Los Angeles, Cal.
500,819.—TRACTION WHEEL—A. G. Rose, Fresno, Cal.
500,779.—CHIMNEY—H. Savage, S. F.
500,624.—CAR COUPLING—J. L. Sorvell, Altbouse, Ogn.
500,970.—FORGING HAMMER—A. Sperl, Los Angeles, Cal.
500,677.—INJECTOR—J. W. Stanley, Oakland, Cal.
501,032—FRUIT-PICKER—J. Swanburg, Los Angeles, Cal.

The following brief list by telegraph, for August 1st, will appear more complete on receipt of mail advices:

California—John F. Appleby, Santa Cruz, grain-binder; John L. Blockbarger, Pasadena, orange or fruit cleaning machine; Joseph Clark, San Francisco, exploder for projectiles; William C. Dierrick, San Francisco, ratchet wrench; Benjamin F. Gilman, San Francisco, plant or tree protector; Elias Groat, San Luis Obispo, two patents for apparatus or machines for reducing and softening bituminous rock; John C. Hunter, San Francisco, tool-holder; Henry G. Krasky, San Francisco, station indicator; Ross A. Ludlow, Globe, churn; William H. Masterman, Oakland, fictional motion transmitter; George H. Merrick, San Francisco, bushing and faucet; Thomas Sheen, Oakland, lawn sprinkler.

Gregon—Joseph E. Adcox, Lehmon, jewel and pivot gauge; Eugene R. Holcomb, Portland, electric water-wheel regulator; Daniel K. How, Portland, book-binding; Leonard Kuckartz, Portland, warehouse gang-plank.

Washington—Guy Sterling, North Yakima, corduit.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DETACHABLE UMBRELLA COVER.—Matilda C. S. Brown, Berkeley. No. 501,819. Dated July 18, 1893. The object of this invention is to provide an easily detachable covering for parasols and umbrellas, so that with a single frame a person may have as many different covers as may be desired, it being especially applicable for parasols, of which ladies desire to have many different covers to go with different suits of clothes. As many covers having as many different colors or styles as may be desired are made to fit a single frame, each cover having its top stitched to it, and the spring catches, and it is only necessary to unfasten the spring catches, slip the tops off the ends of the ribs and release the clamping sleeves to remove a covering. Another cover can be substituted by reversing the operation.

STEAM ENGINE.—Augustus Knudson, San Francisco. No. 501,793. Dated July 18, 1893. This is a novel invention for engines propelled by steam or other vapor, or air, or gas under pressure. It consists of an arrangement of transversely reciprocating pistons, one moving within another, and the exterior one within a correspondingly shaped case, valves by which the propelling medium is admitted alternately at opposite ends of the pistons, and a crank and crank shaft through which the reciprocal motion is converted into a rotary motion.

EVAPORATING PAN.—Elton R. Shaw, Los Gatos. No. 501,848. Dated July 18, 1893. This invention relates to that class of evaporators in which the liquid to be evaporated is exposed in thin sheets or films to the action of the evaporative agents. There are many liquids, notably saccharine liquids, in which deleterious chemical changes take place at or near their boiling point. It is the object of this invention to avoid such changes and to provide simple means for rapidly evaporating liquids at a low degree of heat, and with mechanism that is easily controlled and readily cleansed from scale or other dirt. The essential parts of the invention are one or more rotating cylinders, which may be made of metal, paper, glass, or other substance, incased in a tight jacket, which may be filled with water, steam, hot air, or other vapor, or liquid, and an exhaust fan for creating a current of air through the cylinder or cylinders.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 3, 1893.

Government Silver Purchases.

For the first time in three years the Government failed to buy the full monthly quota of silver last month. Most of the purchases made were the result of counter bids, after the prices of sellers had been declined. There were no proposals considered on the 3d or 5th July. On the 7th July 1,298,000 ounces were offered. Of this quantity the Mint Director took in 200,000 ounces at 72c, and offered the same figure for the balance. The next day he secured 538,000 ounces at the price offered. The purchases for July were as follows:

Date.	Range.	Ounces.
July 7	72.00	638,000
July 10	71.50	100,000
July 12	71.50	30,000
July 14	72.50	100,000
July 17	73.40	380,000
July 19	71.50	75,000
July 21	70.00	345,000
July 24	69 60	157,500
July 26	70.30	196,000
July 28	70.30	50,000
July 31	70.30	216,000
Public awards		2,287,500
Private purchases		96,500
Total		2,384,000

Fine Silver in July.

The price of fine silver last month was hardly the same for any two consecutive days. On the 1st of July it was quoted at 33½d for 925 fine in London and 70c for 1000 fine in New York. From the 4th to the 7th of July it was 34¾d to 34¾d in London and 71 to 75c in New York. After that date it fell to 33¼ in London and 70½c in New York. The best price in the last half of the month was 33¾d in London and 72¾c in New York. These were the quotations on the 17th of July. On the 22d of July it was down to 32½d in London and 69c in New York, the lowest figures for the month. For the last three days in July it was 32½d in London and 69⅞ to 69¾c in New York. The extremes in both markets for the first seven months of the year were as follows:

	London		New York	
	High.	Low.	High.	Low.
January	38 9-16d	38 2-16d	84c	82½c
February	38 8-16	38 2-16	84¼	83¾
March	38 6-16	37 9-16	83⅝	81⅜
April	38 5-16	37 14-16	83¾	82½
May	38 9-16	37 8-16	84⅛	82¾
June	38 12-16	30	83¾	62
July	34 12-16	32 2-16	75	69

In July, 1892, the extremes in London were 40¾d to 39 1-16d, and for the first seven months of that year 43 12-16d to 39d.

Pig Iron.

Complete statistics of the United States production of pig iron for the first half of 1893 are available. They show the total production to be 4,562,918 tons, against 4,769,683 tons in the first half of 1892, the decrease being 206,765 tons. According to the bulletin of the Iron and Steel Association the production for the second half of 1893 will be much below that of the corresponding half of 1892. It is, however, considered remarkable that the first half of this year of depression should show an increase of production over the second half of the previous year of 1892, the increase being 175,601.

NEW YORK, July 20.—Following are the closing prices for the week:

	Silver in London	N. Y.	Copper.	Lead.	Tin.
Thursday	32½	69⅜	10 00	3 35	19 05
Friday	32½	69¾	10 00	3 35	19 00
Saturday	32½	69¾	10 00	3 40	19 00
Monday	32½	69¾	9 95	3 40	18 90
Tuesday	32¾	70¼	9 90	3 30	18 85
Wednesday	32¾	70⅜	9 90	3 30	18 85

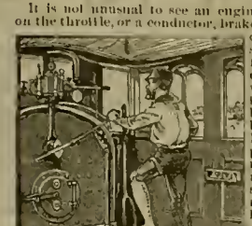
ARTIFICIAL LEGS AND ARMS

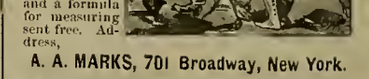
WITH RUBBER FEET AND HANDS.

It is not unusual to see an engineer with hand on the throttle, or a conductor, brakeman, fireman, carpenter, mason, miner, in fact men of every vocation, wearing one or two artificial legs with rubber feet, Marks' Patents, and performing as much labor as men in possession of all their natural members.



Over 14,000 artificial limbs of Marks' Patents in use. Purchased by the U.S. and many foreign governments. One-half of the limbs furnished by us are made from measurements without our seeing the wearers. Fit guaranteed. A treatise of 430 pages, with 260 illustrations and a formula for measuring sent free. Address,

A. A. MARKS, 701 Broadway, New York.



WORLD'S FAIR REDUCTION.

San Francisco Pioneer Screen Works

JOHN W. QUICK, Proprietor.

GREAT REDUCTION IN MINING SCREENS UNTIL the opening of the World's Fair. Perforated Sheet Metals, Steel, Russia Iron, Zinc, Copper, Brass, Etc.

MINING SCREENS A SPECIALTY.

221 & 223 First St., San Francisco.

QUARTZ SCREENS

A specialty. Round, slot or hurred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

A pneumatic tire is an improvement on the old-time sulky. So is a Clayton Air Compressor over other makes. Catalogue on application.

Clayton Air Compressor Works, 43 Dey Street, New York.

C. W. MOULTHROP,

225 Mission St., San Francisco,

Model Maker, Draughtsman, Blue Prints, Models of Machines, Etc.

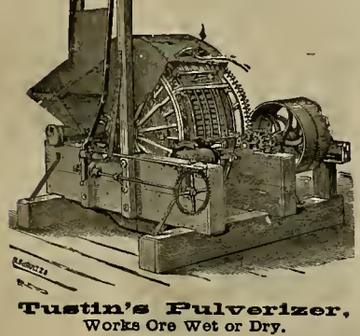
MODELS OF MINING PROPERTY.

FULTON ENGINEERING AND SHIP-BUILDING WORKS.

Successors to FULTON IRON WORKS (Hinckley Splers & Hayes), and F. A. HUNTINGTON,

ENGINEERS, MACHINISTS AND IRON FOUNDERS.

OFFICE AND BRANCH WORKS: 213 FIRST STREET.....MAIN WORKS: HARBOR VIEW, SAN FRANCISCO, CAL.



Tustin's Pulverizer, Works Ore Wet or Dry.

MINING AND MILLING MACHINERY

ADAPTED TO EVERY DESCRIPTION OF MINING AND MILLING.

MANUFACTURERS OF THE TUSTIN PULVERIZER, Adapted to Wet or Dry Crushing.

ALSO, THE WELL-KNOWN "HUNTINGTON" CENTRIFUGAL ROLLER QUARTZ MILL.

Special Descriptive Circulars of these Mills sent on application.

Specialties manufactured by us:

"HUNTINGTON" BLAKE ROCK BREAKER. FRUE VANNERS.
"FULTON" BLAKE ROCK BREAKER. "BOSS" CONTINUOUS SYSTEM.

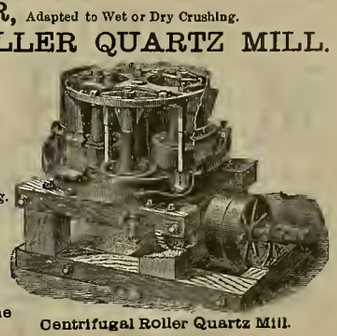
Manufacturers of all kinds of

SAW-MILL MACHINERY, Including the "HUNTINGTON" SHINGLE MACHINE.
WATER WORKS, IRRIGATION PUMPS.
ELECTRIC LIGHT AND ELECTRIC R. R. AND CABLE R. R. PLANTS.
STEAM ENGINES—Plain Slide Valve, Corliss High Pressure, Corliss Compound Condensing and Non-Condensing.
BOILERS OF ALL KINDS.

STEAMER MACHINERY AND STEAM VESSELS

Adapted to Ocean Going, Deep River, or Shallow River Service.

AGENTS AND MANUFACTURERS OF THE.....
De La Vergne Refrigerating Machines, Filters of the New York Filter Company.
SOLE AGENTS FOR.....
The Deane Steam Pump, Armington & Sims Engines, Leffel Water Wheel of the W. C. Leffel Engine Co.



Centrifugal Roller Quartz Mill.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

MANUFACTURERS FOR THIRTY-THREE YEARS.

CALIFORNIA WIRE WORKS

OFFICE, 9 FREMONT ST., SAN FRANCISCO, CAL.

LOS ANGELES AGENCY, LOS ANGELES, CAL. PORTLAND AGENCY, PORTLAND, OREGON.

WIRE ROPES
For Mining, Hoisting, Transmission of Power, Etc.

WIRE CABLES
For Cable Railways, Etc.

WIRE RIGGING
For Ships, Derricks, Etc.

WIRE of all kinds
Best Steel.

WIRE NAILS,

BARBED WIRE,
Regularly Licensed.

HALLIDIE'S PATENT WIRE ROPEWAY

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORE AND OTHER MATERIAL.

Erected by us during the past Fourteen Years in Spans of from 200 to 2000 feet. Simple, Economical and Durable. Have been Thoroughly Tested in all Parts of the Country.

Miners' Wages on the Comstock.

The Comstock miners are not disposed to accept a reduction of wages unless some hetter reasons are assigned than those presented hy the managers of the companies. The reduction of salaries of officials, they contend, should have taken place long since, and if this had heen done and economy practiced in other ways, the men who do the actual work in the mines need not have heen called npon to accept less wages. The members of the miners' unions claim also that their wages are not paid hy the mine managers, hut by the public who hold shares in the various companies they represent, and if the mines had heen operated properly in the interest of the stockholders the cost would be 60 per cent helow present monthly expenses without redncing miners' wages. These men cite the case of A. C. Hamilton, who they say has heen drawing a salary of $2500 a month as the superintendent of Chollar, Potosi, Alpha, Exchequer, New York, Silver Hill and Ward shaft, and has an assistant in Roger Pendergast at $1500 a month. Then the presidents and other officials in the city offices have heen drawing hig salaries, which have to he paid out of the assessments collected.

As a result of these and other unwarranted expenses, many mines which have heen prodncing ore for years have heen maintained hy the assessment plan, and not hy dividends. The Crown Point, Belcher, Yellow Jacket, Savage and Hale & Norcross, though regular ore producers for 20 years, have had to have their alleged deficiencies in operating expenses made up hy assessments.

The officers of the Virginia Miners' Union, Gold Hill Miners' Union and Mechanics' Union have communicated with Messrs. J. L. Flood, John Mackay, J. P. Jones, F. G. Newlands and other prominent men holding controlling interests in Comstock mines, asking if they favor the proposed reduction in miners' wages. Mr. Flood, while he helieves the wage-earners should be the last to he reduced, thinks the reduction would be beneficial at present and commendahle on the part of the miners.

Supt. Yerington says the Virginia & Truckee Railroad is prepared to make ample reductions on ore, wood and lumher freights to the point of almost no profit, with the understanding, of course, that all other interests connected with the mines do the same, the ohject being to place the Comstock mines on a living, paying hasis if possihle, giving people all the employment and husiness to which they are justly and fairly entitled.

If the railroad company, water company, mill companies and salaried officials all accept material reductions and more economical methods prevail, it would seem as if the mines could be operated without reducing the wages of the actual miners, especially as there are now only ahout 300 of them at work on the lode. On the other hand it may he said that miners are plentiful just now and thousands are in search of work, so that those in positions could hetter accept lower wages than be thrown out of work altogether. The delinquent lists on assessment sales of the Comstock companies are growing wonderfully in length, showing a very decided disinclioation to pay on the part of stockholders, so that all the companies are short of funds. All the miners in the union oppose the reduction of their wages, claiming that what is paid them cuts a very slight figure in the monthly expenses of operating the Comstock mines. In this most people familiar with the situation will be apt to agree with them.

SELBY SMELTING AND LEAD COMPANY'S SMELTING WORKS.

ALFRED DE LA BOUGLISE, managing director of the Lexington mine of Butte, Mont., is in this city. Mr. de la Bouglise represents the French syndicate which not only owns the Lexington, hut also several California and Colorado properties. The Golden River (or Red Point) mine on the Forest Hill Divide and the Hogshack, near hy, belong to this syndicate, which has also huilt a custom mill at Cripple Creek, Colo. The Hogshack is not at present heing operated but work continues in the Golden River. Mr. de la Bouglise has had considerahle experience with California gravel properties.

A GREAT MANY miners from Colorado, Nevada and elsewhere are coming to Grass Valley, in this State, in search of work. The town already has plenty of miners for all the work on hand, and there are now about five men for every position. It is useless for more miners to go there in search of employment.

THE White Cloud copper mine and smelter, near Lovelocks, Nev., has heen closed down, owing to the stringency of the money market.

The Selby Smelting and Lead Company.

The accompanying cut is a view of the Selby Smelting and Lead Co.'s works, located at Vallejo Junction, Cal. These works were established in 1868, and are the pioneer smelting and refining works of the Pacific coast. The larger part of the gold and silver produced on the Pacific coast, from Alaska to Mexico, is parted and refined at these works. In addition they smelt gold, silver and lead ores and concentrates, and are in constant receipt of such products from all points on the coast. During the present depression in silver and lead mining, when so many smelting works all over the West have closed down, the Selby Company have continued their husiness just as usual, greatly to the henefit of the mining community. This company also refine hase lead bullion produced by the various reduction works tributary to San Francisco; and also manufacture sulphate of copper (bluestone) in large quantities. A special article of manufacture is the Standard machine-loaded shot gun cartridge, loaded hy the Chamherlin machine, which is the most perfect loader ever invented These cartridges give the greatest satisfaction and are used almost exclusively hy the crack shooters on this coast and elsewhere.

This company also have an extensive factory located on the southeast corner of First and Howard streets, where they manufacture drop, buck and chilled shot, lead pipe, sheet lead, bar lead, lead traps, solder in various shapes, hahhitt metal, sash weights, etc. They also deal extensively in hlock tin, spelter, antimony, copper, etc.

Their main office is located at 416 Montgomery street, San Francisco, where deposits of gold and silver are received for refining. They also keep on hand refined gold and silver for use of jewelers and silver-platers. In addition they assay ores and hullion, reduce jewelers' sweeps and photograph waste. The premises used for their main office are those formerly occupied hy the San Francisco Assaying and Refining Works, and later hy the Pacific Refinery and Bullion Exchange, whom they succeeded in 1879. This huilding has heen in continuous use as a gold and silver refinery and assay office since early in the fifties. They have recently purchased a lot in the rear 35x55 feet, and now have a property 192½ feet deep, running through from Montgomery to Leidesdorff streets. They are now making extensive improvements in this property to meet the demands of their husiness, and will shortly have the finest smelting rooms and assay offices to he found on this coast or elsewhere. The officers of the company are, A. J. Ralston, president; H. B. Underhill, Jr., secretary; Alfred Ropp, superintendent.

Comment.

Some of the anti-debris papers think that the professions of the miners at their State convention were not sincere, and that their pledges have not been kept. They quote the address of the Miners' Association, in which all miners are asked to desist from illegal mining, and individuals are asked to accept the policy of the association in this respect. It will be remembered that the Miners' Association made this appeal long ago, and urged that all hydraulic mining cease wherever it was calculated to injure the navigable streams or valley lands, or wherever the debris could be carried into navigable streams. The writer of this paragraph was the writer of that resolution, and remembers that it was adopted by the miners' executive committee without a dissenting vote. The anti-debris people now profess to believe that the miners were insincere in this. We are sure that they were not, and are not. Some individuals doubtless did not comply with this request, just as some individuals had continued to mine all these years when most of the hydraulic mines were closed. Who they were and why they were permitted to do this could doubtless be better explained by those directly or indirectly connected with anti-debris movements, than by those connected with the miners' movement. If these men who broke the laws had been rigidly held to account and punished, it would have been greatly to the general advantage of the whole hydraulic-mining interest. They have injured its cause and given out not only weapons, but sinews of war, to the enemy of their industry. The Miners' Association discountenances this whole system, issued its address in all sincerity, and stands by it to-day as it did the day it was first published.

Mr. J. A. Edman, superintendent of the Diadem mine, Meadow Valley, Plumas county, has been for many years making a study of the subject of milling of gold ores. In addition to the ordinary practical observations gained by a miner and millman of experience, he has been making microscopical examinations of mill products and has developed many interesting facts. The editor of the MINING AND SCIENTIFIC PRESS had an opportunity last week to examine many of the slides prepared by Mr. Edman, and found them of the greatest interest to gold miners and millmen. The slides prove beyond question that much fine gold is lost in ordinary operations, and they show the wonderful divisibility of the metal in many ways. The investigations in connection with the selenides show the reason why some gold miners have failed to obtain the gold from their ores. Doubtless many are operating on this class of ores without knowing the reason why the gold will not amalgamate. Mr. Edman's researches in connection with concentrates, sulphurets and plate sands are especially interesting and valuable. Very great care and skill have been exercised in the preparation of these slides for use under the microscope; but Mr. Edman is an enthusiast in this direction and has spared himself no trouble. He has prepared a series of articles on the subject of milling of gold ores, the first one of which appears in the PRESS of this week. The articles should be read by all interested in gold-mining, as many new points are brought out which are valuable in every-day work around a mill.

The manager of the Anti-Debris Association, in a recent report to the Executive Committee, referring to what he calls the efforts of the Miners' Association to secure such amendments to the Caminetti hill as will virtually withdraw the sting from that law, says that, in his opinion, "it is an effort to be permitted to mine without restriction and to have the Government build the restraining works for the miners." If Mr. Phipps is earning his salary only by this kind of talk, he is overpaid. If the miners want to mine without restriction, what do they want of restraining works? If they want the Government to build dams for them, then they cannot be making an effort to mine without restriction. The fact is, this manager is opposed to anything the miners want on general principles, and he is making all round guesses as to what they do want. If the dams will hold back the debris, as the Government engineers assert, experience proves and the Government law warrants, why should Mr. Phipps or his association object to them, even if the Government builds them for the miners and collects pay from them afterward. His association pretends that it only wants the rivers and bordering lands protected. Yet the Anti-Debris Association opposes the dams, which are the very things to preserve the rivers and lands. Their course is entirely inconsistent. What difference can it make to them who builds the dams, provided they are built and the debris restrained? They ought to be glad to see the works built by anybody so it costs them nothing. The truth is, however, if these dams are built the Anti-Debris Association, its managers, spies and employes will all be out of a job. This is the only way to account for their being opposed to the miners' efforts to comply with the law and have the dams built. This is one of the reasons for keeping up the agitation against hydraulic mining outside of the plain one of preserving the rivers and lands.

The MINING AND SCIENTIFIC PRESS made a correct prediction when it stated that there would be no great rush to list California gold mines with the stock boards, to be made the subject of stock speculation like the silver mines. The San Francisco Stock Exchange suspended its rule for 30 days and admitted gold mines without the $500 fee, asking only the $100 annual dues. Two weeks have passed since the announcement but only two or three companies have availed themselves of the opportunity. Most of the California gold mines are worked as legitimate mining enterprises and the stock-dealing feature has never been at all prominent. It is true that those which have been listed are working mines of value and reputation, but it is evident that the gold-miners are not anxious to see their mines manipulated as silver mines have been. There are several thousand gold properties in this State, big and little, and when only two or three of them take advantage of the offer of free entry, it shows that the gold miners are rather shy of the stock-dealing feature.

If Hon. J. A. Yerington, chairman of the Nevada State Board of World's Fair Commissioners, is correct in his assertions, Nevada is a great deal worse off than California in the matter of idle mining property. He tells a Chicago *Dispatch* reporter that there is to-day in Nevada $150,000,000 worth of mining property which is lying practically idle because of the depression of silver. We have in California $100,000,000 worth of practically idle hydraulic mines, so Nevada is $50,000,000 ahead of us in this respect. Our mines are gold producers when they can be worked, and while the Nevada mines are mainly silver, considerable gold is also produced from them. As to the time of starting up all these these idle properties, there is almost as much doubt in one case as in the other. The responsibility rests largely with Congress in both instances.

A representative of the Southern Pacific Co. has been up in Shasta county inquiring into the mining interests in regard to the shipment of ores. He is also to visit Trinity and Siskiyou counties. The present rates from Redding to the Selby Smelting Works on tide-water are $84 per ten-ton carload for ore not exceeding an assay value of $75. It is about time that such an exorbitant charge should cease. It is time also that the railroad company should cease charging on something that is none of their business—the value of the ore. Increasing the rate per ton as the value of the ore increases, thus taking the profit which the mine-owner should have, is a Southern Pacific custom, but it ought to be stopped. If the company will put any sort of decent rate on ores, the shipments from the northern counties would largely increase, and numbers of mines, now idle, could be operated. Perhaps the company fears that the upper river will be made navigable to Redding, and intends forestalling any probable opposition by lowering its rates.

Quartz mining is looking up in California. Several good sales have been made of late, and some of the larger properties are increasing their output. There is a good demand for "going" gold mines, and some demand also for those in process of development. It will not be long before prospects will be sought for also. There are more gold mines and prospects in California than in any other State in the Union, and now that so many silver and lead mines have closed down in other sections, attention is being turned to the gold claims of this State. Those who own small claims should open them up, as far as possible, and put them in shape to be examined by possible purchasers. This is California's chance, while mining is depressed elsewhere, to enlist the aid of capital in developing her gold properties.

Application for License to Mine by Hydraulic Method.

The first formal application for license to mine by the hydraulic method, under the Caminetti law, is now before the California Debris Commission, and the advertisement for the hearing will be found in another column of the MINING AND SCIENTIFIC PRESS. This application will be speedily followed by others which are now being prepared.

A large proportion, however, of those who would be willing to erect restraining and impounding works are financially unable to do so. If permission had been given ten years ago to put up these dams, with the Government's guarantee that the owners could work behind such works, almost all the mines could have complied with the requirements. The situation now, however, is different. The reservoirs, ditches and flumes are in bad order, or useless, the pipe-lines rusted out, and the owners "broke." Not having been able to work their mines, they have neglected or partly abandoned the plants, and have not now the means to rebuild them.

This is a very unfortunate state of affairs just at the present time, since it is absolutely impossible for the mine-owners to obtain money to equip their claims. Money, too, is necessary to build the dams. It is useless to file petitions for license to mine when it is known that a chief requisite is to construct a restraining dam, and there are no available funds to do this. Money is not now being loaned on city real estate, or on the usual stocks, bonds or other securities. Borrowing it on a mine in the mountains, to be worked under a new law not yet put to the test of judicial inquiry, is entirely out of the question.

And yet the country wants the gold buried in these hills more than it ever did before. It is not only California, but the whole United States needs it. We know the gold is there, and we know that by turning on the water it will reveal itself and become available for the uses of man. The bank is there but its doors are locked.

To save some narrow strips of agricultural land along the banks of a river—land already partly destroyed—this gold must remain hidden, until a less prejudiced later generation sees fit to take it out. The unrestricted operation of these mines for a single year would pay for the same lands three times over. It is to be hoped that these coming generations will not be so hard up as the present one, but even if they are not, they will be wise enough to get this gold.

They will realize that pumpkins, potatoes, peanuts and other agricultural products may be raised in Texas, Kansas, Nebraska and elsewhere, but that these places cannot produce gold, while California can. It is gold we are all after in any business, even in agricultural pursuits. Gold is the result looked to in the end. And here is gold direct at one operation, yet it may not be taken because some agricultural land is injured.

A great many persons, with little knowledge of this subject, have been led to believe that an immense extent of agricultural land all over the State has been, or would be, injured by the debris from the hydraulic mines. This is entirely a mistake. The damage is confined to lands bordering the river in a few counties only. This has been injured beyond doubt. Its total value, however, was originally not above $3,000,000, while the stoppage of the mines practically confiscated, or rendered useless, mining property worth $100,000,000, and producing $8,000,000 to $10,000,000 a year.

It is true that the damage to the Sacramento river should be also considered. Debris from all sorts of mines has been going into that stream ever since mining commenced in this State, and debris from agricultural sources has been going into it, too. Constant plowing loosens the soil, and the rains carry much of it into the streams.

Cutting of timber on the mountain sides and the de-

struction of the brush leaves them in such condition that debris is added from this source too. The bands of sheep loosen the soil also. The progress of civilization in all regions adds to the burdens of the rivers in many ways. Napa creek, Petaluma creek, Alviso creek and dozens of others in purely agricultural sections have filled up and shoaled since the country was settled.

Under the new law the owner must pay the penalty not only for the results of his work but that of the farmer, horticulturist, lumberman, sheepman and others. The burden is all on the miner. He must not only put up a dam to hold back his debris but must pay three per cent of the gross yield of his mine for the privilege. More than that, the Government wants to protect its navigable streams, but the miner must pay the expense.

Now these miners are perfectly willing to put up the dams at their own mines, and hold back the debris caused by their operations. But they do not want to pay for the result of the work of those who have gone before them, or the result of the work of those in other occupations.

The Government should, at its own expense, and to save its own rivers, build the dams at the heads of the main navigable streams so as to restrain the material now on them and sure to come down in time. It would thus hold back all that has been contributed by all classes. The State stands ready with $250,000 to add to whatever the Government contributes for this purpose. When these main dams are built, then the miners, when they build their dams, will take care of that for which they are alone responsible.

The men who manage the Anti-Debris Association have officially declared themselves as opposed to dams for holding back debris, notwithstanding the contrary opinions of engineers. These anti-debris people, while opposing the dams, offer no suggestion for any other remedy except the one they have always maintained—the absolute closing of all hydraulic mines, so as to save all the cabbage patches. At this time, however, they will find little sympathy with their ideas, since during the past two years the people of this State have become educated on this subject, and want the mines to resume work as soon as possible.

The fact remains, however, that very few miners have availed themselves of the opportunity to apply for a license, because very few are in a position to build the dams, for the reason stated. They must get help in some way if the mines are to be again operated. If Congress would put up the dams and collect the pay from the miners afterward, the question would be solved at once; but whether this can be done or not remains to be seen.

Now that one mine has applied for license to operate, we shall soon find out the ideas of the Commission as to the nature of the restraining works. Many miners have been waiting for this. It is not probable, however, that the Commission will require the same kind of works for every mine. Each case will be considered separately, and the surroundings and conditions studied. Some claims can be easily prepared, and others cannot be prepared at all. The judgment in all these matters rests with the Commission.

At a meeting of the Harbor Commission two weeks ago six bids were received for the construction of slips 5 and 6 at the foot of Market street, and the lowest was $48,945. The bids were all rejected and new ones were opened this week. As a result the contract was let to G. W. Stewart for $43,939 dollars. Seven bids were handed in, the other six as follows: San Francisco Bridge Company, $47,500; Doe, Hunt & Co., $52,870; Darby Laydon & Co., $48,700; California Construction Co., $44,444; B. McMahon & Son, $48,950, and Healy, Tibbetts & Co., $50,300. Mr. Stewart is the general manager of the Pacific Pine Lumber Company, and acted in this matter for his corporation. Hitherto the lumber company has confined itself to furnishing its product to contractors. It entered into competition on this work because no satisfactory arrangement could be made with any of the contracting firms to furnish them lumber. The estimate of Chief Engineer Holmes of the Harbor Commission for the net cost of the two slips was $43,200; that is to say, the bare cost of the material and labor, allowing nothing for profit. The lumber company's bid is $789 above net cost.

Coast Coal-Miners' Wages.—The Nanaimo (B. C.) colliery employes have accepted, by a majority vote of 284, the reduced terms offered by the owners. It was a question of doing this or seeing the mines close down. The East Wellington coal-miners offered to accept a reduction of 10 per cent, but, on tendering it to the manager, they were informed that unless they accepted the 20 per cent cut the mines would remain closed. In the case of the Northfield men, they offered to accept a reduction of five per cent, which the superintendent refused to accept. Finally, the men agreed to accept ten per cent reduction, which was agreed to. At the Dunsmuir-Wellington mines the men expect to be called upon to stand the same reduction as the other miners in the district. At the Union collieries, Victoria, work is brisk and the miners are working full time.

The gravel mines on Old Baldy mountain, San Bernardino county, are to be worked by a Nebraska company. A reservoir has been built and a pipe line laid for hydraulicking at an expense of $30,000.

Foundry Notes.

The foundry and machine business in San Francisco was never duller than it is at present. The financial stringency has affected every shop in town, large and small, and all are suffering from want of orders. Very radical steps are about to be taken in the matter of reduction of expenses by the larger shops, which will doubtless be followed in time by all engaged in the line of iron-working. The Risdon Iron Works lead off in reducing wages, and the other establishments have the same thing under consideration. This is something that was bound to come in time, as, under the present conditions, there is little or no money in the business for those having their capital invested. Higher prices for coal and iron and higher wages than in the East have restricted the operations of the local works, and, if they are to continue operations with any success, a change must be made in the wages of the mechanics.

As to possible strikes against the reduction, this is a very poor time for that sort of thing. There are a dozen men ready to take the place of one who quits work. Work is scarce for men, as orders are scarce for the shops.

There has been a gradual change in the past few years in the foundry business in this city, as the circle has narrowed within which orders are probable. Chicago manufacturers have cut into our trade to a great degree, and our foundrymen have been compelled to carry in stock certain articles which were formerly built only to order. Small engines, pumps and numbers of other articles of ordinary types are now sold by some of the foundrymen just as they are by importers who are not manufacturers. While under present circumstances no large enterprises are being inaugurated requiring new machinery, very little indeed is being done at the local shops, all of which are running short-handed.

The burning of the factory of the Pacific Nail Works at Oakland last Sunday morning entailed a very heavy loss, reaching almost $200,000, with $82,000 insurance. The warehouse and rolling mills were saved, but the main buildings with the machinery were totally destroyed. The works have not been in operation for some time, there being a large stock of nails on hand. The capacity of the works is 25,000 kegs a month. They have $140,000 worth of raw material on hand, and the works will shortly be rebuilt.

Advices from Los Angeles are to the effect that work has been commenced on the erection of a rolling mill in that city, and the plant is expected to be in operation by January. It is stated also that the machinery has been ordered from the East; that sheet iron only will be made at first; and that the mill will make a market for scrap iron, which has now practically no value. This latter item will be news to the Pacific Rolling Mills, Judson Iron Works, Pacific Nail Works, etc., which are large consumers of scrap iron. There may be room for another big rolling mill in California, but it does not look like it. Just at this time the Pacific Rolling Mills have some 500 or 600 men less than usual at work.

Coast Industrial Notes.

The Chino beet-sugar factory is now daily making shipments of sugar to this city.

The number of trainmen now on the extra list of the Southern Pacific is said to be 260, the largest in the history of the company.

Over 500 men were thrown out of employment at Usal, Mendocino county, recently, in consequence of the closing down of the lumber mills in that vicinity.

The prevailing hard times exercise an influence on the street-car lines, and all the companies in this city have found it necessary to reduce the number of cars in use.

A reduction of forces was made at the Scotia mill, near Humboldt bay, on August 1st, laying off 80 men. One-half of the mill has been shut down also, which will make the reduction affect about 130 men.

California makes more sugar from beets than any other State in the Union. Last year there were 15,993 acres planted to beets, and 43,500,000 pounds of sugar were made, an increase of about 35 per cent.

The large iron bridge spanning the Russian river, at Hopland, collapsed on Tuesday, and dropped a four-horse team and wagon into the river. The bridge is not an old one, but has been considered unsafe for some time.

In Alameda county there are 214 vineyards, with an acreage of 7083. The stock of wine on hand is 2,034,550 gallons. There is said to be an excellent opportunity for a large public winery that would pay investors well.

Considerable land reclamation work is going on in Butte and Sutter counties. A tract of land 32,800 acres in area, in Butte and Sutter counties, which is overflowed every winter by the Butte creek and Sacramento river, is being reclaimed.

At Ensenada, Lower California, two flour mills are now running. The country around produces considerable wheat, and the flour is being furnished to various places along the peninsula on both sides. There are now close to 12,000 people in Ensenada.

On Monday bids were opened at Ukiah for furnishing the male ward of the insane asylum. Charles Cunningham and Eversole & Templeton, local bidders, got the bulk of the contracts. The Golden Gate Manufacturing Company and the San Jose Woolen Mills Company also secured contracts.

The new order for the reduction of working days of railroad men affects all employes of the shops located at Ogden, Terrace, Wadsworth, Truckee, Sacramento, Dunsmuir, Portland, Oakland, San Francisco, Bakersfield, Los Angeles and Tucson—about 6000 men in all—and comprises blacksmiths, boiler-makers, engineers (stationary), firemen (stationary), machinists, painters, carpenters and others with their various helpers. Auditor Foster stated that the monthly pay of all these shopmen would aggregate about $500,000.

The Redlands Electric Company turned on the current last Saturday, lighting the streets of the city. The event was celebrated by a grand mass meeting. The new factory of the Union Ice Company, run by electricity, will be started at once. The electric works are located in the mountains, six miles east, with 1300 horse-power developed.

Construction work on the new Mission-street electric road in this city has been stopped for some time. The reason for the delay in carrying on the work is said to be due to the financial stringency which has struck the Southern Pacific Company, which corporation owns the City Railroad. Work on the newly-ordered cars, it is said, has also been stopped.

Builders and contractors of Oakland will be interested to learn that a company representing large capital will soon establish in Oakland a depot for the sale of brick, cement, lime, plaster and lumber. Water-front privileges are said to have been secured for current delivery, and it is intimated that a branch depot will also be established in East Oakland.

The dam of the big storage reservoir near Eddy, N. M., was carried out by a cloudburst last Saturday. The dam was located six miles up the valley from the town, but the water did not enter the town. The reservoir had 7,500,000,000 gallons. The damage amounts to $125,000. President Hagerman telegraphs Manager C. B. Eddy from New York that the dam will be rebuilt at once.

The Judson Powder Company are manufacturers of dynamite and other explosives, at West Berkeley. A number of citizens have brought suit to restrain the company from putting up more buildings or manufacturing explosives on the present site. The powder company has expended a great deal of money in improvements at West Berkeley, and naturally objects to moving away.

The electric cars will be running to Baden inside of three weeks. That is what is promised by the San Francisco and San Mateo Electric Railway Company. Fifty men are at work between the present terminus at Holy Cross cemetery and Baden, and over half of the roadbed has been laid since work was commenced two weeks ago. The other half will be laid within the next 14 days, and the mile and a half of extension will be completed and in operation by the first of next month.

The Southern Pacific Co. will meet the opposition on the creek route to Oakland by a cut to a 5-cent fare. In addition to the single fare, packages of 100 tickets will be sold for $2.50. These tickets will be good for any trip on the creek route and will be transferable. The 5-cent fare applies to the steamer Alameda, which runs between slip 8, on this side, and the foot of Broadway, Oakland. The steamer will make six trips daily, leaving San Francisco on the quarter after the odd hours, and Broadway, Oakland, on the quarter after the even hours.

Through business has fallen off greatly on the Southern Pacific, and the local business is reported as indifferent. Under these circumstances as little work as possible in keeping up the line in a condition for traffic will be done. It is quite likely that other measures of economy will be practiced, that train crews will be further reduced and that the office may suffer. The truth is that for the first time in its history the Southern Pacific is sorely pressed for funds. It has not the money with which to pay its employes. The June salaries have not been paid as yet.

A dispatch from Astoria (Or.) dated Aug. 5th says: The total pack of salmon for the whole river to date is 239,612 cases, and of this 145,620 cases have been put up in the Astoria canneries. The pack to date, at a careful estimate, includes 380,000 cases of Chinook salmon and 920,000 of small fish, mostly steelheads and blueblacks. It is now certain that the total season's pack will amount to from 275,000 to 282,000 cases, or at best 173,000 cases short of last year. All the canneries on the lower Columbia river will this year pack fall fish. They will start to work again September 10th and run continuously till the 1st of November. This will be the first year since 1887 that fall fish have been packed on the Columbia.

The railroad company has reduced the number of working days in the week at its Sacramento shops from six to four. This has been done instead of reducing the force. The new order applies to all employes in the motive power and machinery departments not directly connected with the routine road services, and will not affect the forces in the car-repair yards except as circumstances will permit. Hereafter the shops will not be operated on Friday and Saturday of each week. The total number on the payroll August 1st was 1978 men, out of which only 350 will continue to work the usual time. This order is considered as simply the postponing of repair work and improvements for 60 or 90 days, by which time it is hoped the stringency will be over.

John H. Wise, Henry Epstein, James D. Byrnes, Chas. Goodall and Geo. A. Andenreid have asked for a franchise for a new street railroad in this city. The main line, double track, will extend from the ferries on East street to Broadway, along Broadway to Webster street. From the last-mentioned intersection there will be two branching roads. One of these will turn south along Webster to Fulton street and on Fulton to Lott, then one block south on Lott to Grove street and on Grove street to Stanyan, that is to say between the Hayes and McAllister-street cable roads to the park. The other branch will be run from Webster and Broadway north straight to the bay shore. This line would pass on the west of Lobos square and to the bay between the Black Point and Presidio reservations. The main line would be continued from Broadway and Webster streets out the former to Scott, then down Scott to Washington, and so straight out west to First avenue, and south along that avenue to Fulton street,

on tbe north side of Golden Gate Park. Still anotber branch would be run down to tap the main artery of tbe city. This line would start at Broadway and Dupont street and continue south along Grant avenue to Market street. Tbe object of the road is to tap Russian hill and Presidio heights, two sections of tbe city whicb are now being much favored for residence purposes.

THE prevailing financial stringency has reached tbe Asiatic quarter, and signs of business failure and the consequent poverty are seen at every band in San Francisco's Chinatown. Many firms bave quit business altogether. The United States census of 1890 showed the Chinese population of San Francisco county to be 25,870. During the past three years there bas been an almost constant exodus of Chinese from the city, and conservative estimates place the decrease at nearly one-third. King Owyang, the Chinese vice-consul, estimates that San Francisco's present Asiatic population, including over 500 Japanese, is from 10,000 to 12,000. The police and customs officials, who also keep a pretty close watch on Chinatown, agree that the vice-consul's figures are not far out of the way.

Studies in Gold-Milling.

[Written for the MINING AND SCIENTIFIC PRESS by J. A. EDMAN.]

In viewing the field of metallurgy it cannot be denied that, in comparison with the advances apparent in the treatment of the ores of other metals, but little progress has been made toward ratlonal methods in gold-milling since this industry was first inaugurated in the early days of California quartz mining; and the advance made has been chiefly confined to tne improvement of mechanical means for crushing and concentrating ores, and in the adoption of the chlorination process, with its modifications and improvements, during the last decade. The cyanide process can as yet scarcely be said to have been tested enough to determine its applicability to most gold ores.

The treatment of ores carrying fine gold may be said practically to embrace all gold ores, as but few of these, even when containing comparatively coarse gold, fail to carry a large percentage of fine gold, on the recovery of which the economical success of gold-mining chiefly depends. The total absence of any general system in the treatment of gold ores is strikingly exemplified in the able papers by Mr. T. A. Rickard on the "Variations in the Milling of Gold Ores" now appearing in the *Engineering and Mining Journal* of New York, and applicable not only to Australia, but also in less degree to the gold-producing regions of the United States. In his paper of June 17th this writer touches the keynote to the solution of the problem, when he says: "The great axiom of successful milling is to adapt the reduction process to the character of the ore treated," instead of continuing in the vain attempts, now so general, of trying to adapt the ore to some locally prevailing practice.

In solving this problem there should be no strict line drawn between the labors of millman and metallurgist, as both arts must be merged into one; and the aid of science would have been invaluable had it been directed into this channel, which unfortunately does not appear to have been the case, except in a few instances in the history of the chlorination process.

Without attempting to enter into a review of the different methods of gold-milling now practiced in California, it may be of interest to miners and millmen to give some of the writer's experiences during many years of active work, and which in some degree offer a solution of the problem so long discussed.

Leaving out of view other issues of less importance, the main hindrance to the economically successful treatment of gold ores appears to lie in the generally prevailing ignorance of the true physical and chemical character of such ores, even among otherwise well-informed men of the craft, and the deeply-rooted misapprehensions and prejudices resulting therefrom. It is true that assays and analyses properly applied will partially solve the problem, but while the importance of these cannot be denied, they have as yet signally failed to throw full light upon the subject.

Convinced of the enormous losses in general mill practice, and after repeated lneffectual attempts to solve a difficult question in the treatment of low-grade ores, the writer entered upon a thorough microscopical examination of gold ores and mill products as the only available solution of the difficulty, and with very promising results. A general outline of his observations will be given in the following pages, after which their relation and influence on present gold-milling methods will be briefly discussed.

The investigation was carried on in connection with test mill-runs of ores of different classes, mainly from one large lode presenting a great variety of ores, both free-milling and highly pyritous, carrying both coarse and very fine gold, and was also supplemented by typical samples of the ores and mill products of other mines differing in mineralogical and geological conditions from the first mentioned. The material subjected to examination was as follows:

Ores of every available variety; pulp as issuing from batteries; sands from plate tables; blanket washings, plain and concentrated; concentrations from different classes of ores; slimes from pan and arrastre grinding; sands from tail sluices; average tailings and slimes; amalgams from batteries, aprons, plates, and from pan grinding; floured mercury from batteries, plates, riffles and tailings; contents of floured mercury; roasted concentrates; tailings from chlorination process; accessory minerals not considered gold-bearing, and products of infiltration, percolation and deposition withln gold-bearing lodes.

The loss of gold in mill practice can be traced to the following causes, stated in the order of their importance to the industry:

1st. The extreme diffusion of gold in lts ores.

2d. Our imperfect knowledge of the laws governing amalgamation of gold.

3d. The frequency of chemical combinations between gold and other elements.

In giving the size of gold particles the limit of unaided normal human vision may be taken at the 1-250 of an inch, and smaller sizes will be considered microscopic. Dimensions will be given in fractions of an inch.

While a great diversity as to the average size of gold particles appears in the ores of different lodes, the fact remains that a great proportion of the metallic gold occurs microscopic and invisible even to magnifiers in nrdinary use, whicn readily explains the fact that ores giving even a high assay sometimes show llttle or no gold in panning. A great proportion of the gold observed was below the 1-1000 inch in diameter, and the limit of diffusion has not been reached with hlgh powers representlng a visibility of 1-50,000 inch. This statement holds good not only for gold in quartz of all kinds, but also for that contained in pyrites, both bright and oxidized. The form of the gold particles appears nearly the same both in quartz, sulphides and oxides, being, contrary to general popular opinion, in irregular but compact, occasionally crystalline grains, while acicular shapes or films appear as exceptions. The films are generally found on and near the surfaces of pyrites and in microscopic fissures in hard, fine-grained pyritous quartz. The most irregular, attenuated and crystalline forms appear among the fine particles of purely metallic gold found in decomposed ores, and specially in the snft gouges of the walls of gold lodes and preferably in the talcose rocks, and appear to great extent to be products of infiltrations, solutions and depositions from constantly proceeding chemical changes. The quality of the quartz seems not to affect the size of the gold, and some of the hard, dense and flinty quartz has been observed in which the faint yellowish bands of color are resolved under high powers into a cloud of infinitesimal gold particles seldom exceeding 1-20,000 inch in diameter. Frequently rounded grains with smooth surfaces, in their magnified forms resembling placer gold, are found enclosed in oxidized pyrites, and many varieties of these and other sulphides exhibit an internal silicious skeleton or arborescent structure among which most of the gold is seen deposited.

It is difficult to convey to the mind an understanding of the infinite subdivision of gold in ores except by demonstration under the microscope, but, as an illustration, the revelations of a typical sample will be given. A single chip of hard and flinty, slightly yellowish quartz, 1-50 inch in diameter and mounted in balsam, presented the following features under a power of 50 diameters; gold particles varying in size from 1-1000 to 1-12,000 inch, and generally in compact grains, were noted, exceeding 300 in number. The specimen, being nearly transparent, showed these not only on the surface, but diffused through the mass of the quartz. Higher powers developed still greater numbers of much smaller gold particles even below 1-30,000 inch in size.

Gold in similar forms and sizes has also been observed by the writer in the oxides nf iron and of manganese, in talc, in hornblende, in calcite, in dolomite, in stibnite and senarmontite, in the molybdenate of lead and in the tellurides and selenides of gold and silver.

The sizes and forms of gold in quartz are strikingly exhiblted in many more products, chief among which may be noted the plate sands or gold-bearing grains of quartz slightly adhering to the amalgamated plates of gold mills. The gold originally in pyrltes can be best observed in the minerals resulting from their oxidization and still retaining the form of the original pyrite, or in the products of their decomposition by chemical means.

The Resolutions Adopted at the Silver Convention.

The report of the Committee on Resolutions of the Chicago Silver Convention was adopted as follows:

Bimetallism is as ancient as human history. For more than 3000 years gold and silver came down through the ages hand in hand. Both metals were named together and indissolubly united in the Constitution of the United States as the money standard of value of this country; that in 1873, wlthout the previous demand of any political party or any part of the people, and without public discussion, silver was stricken from the place it had occupied since the days of Abraham and Pharaoh, under the circumstances of such secrecy that A. G. Thurman, W. M. Stewart, B. W. Voorhees, J. G. Blaine (then Speaker of the house), J. A. Garfield and other members of Congress voting for the bill subsequently publicly declared they did not know until long afterward that so great a change had been made in the financial system; that the debates in Congress show that the measure was partly ascribed to one Ernest Seyd, a London banker, who, it is claimed, was sent to Washlngton by the moneyed classes of the old world to secure its passage by secret and corrupt means; that President Grant, who signed the bill, declared long subsequently that he did not know it demonetized silver; that the object of this attack on silver was to double the purchasing power of gold, thus reducing the price of all commodities, arresting enterprises, impoverishing the toiler and degrading mankind; that the awful consequences of this act are now upon the whole world.

The movement of the great crops now being gathered demands a vast amount of currency, which the banks are unable to furnish. In the midst of these conditions the daily press is clamoring for the repeal of the Sherman act, although the repeal means the stoppage of the issue of more than $3,000,000 of money every month, ignoring the fact that to hold the balance level between the debtor and the creditor factions, the supply of currency must increase with the increased population and business. The proper growth of the population is 33 per cent every ten years. The increase of business is much greater.

The preamble then quotes at length from the utterances of James G. Blaine, Daniel Webster and Secretary Carlisle, in favor of a bimetallic currency, and John Sherman on the dangers of monetary contraction. The resolutlons then declare:

There must be no compromise of this question. All legislation demonetizing silver, and restricting the coinage thereof, must be immediately and completely repealed by an act restoring the coinage of the country to the conditions established by the founders of the nation, which continued over 80 years wlthout complaint of any part of our people.

Every hour's delay in undoing the corrupt work of Ernest Seyd and our foreign enemies is an insult to the dignity of the American people, a crushing burden on their prosperity and an attempt to place us again under the yoke from which George Washington and his compatriots rescued us.

We protest against the financial policy of the United States being made dependent upon the opinion or the policies of any foreign government, and assert the power of this nation to stand on its own feet and legislate for itself upon all subjects.

We declare that the only remedy for purely metallic financial troubles is to open the mints of the nation to gold and silver on equal terms at the old ratio of sixteen of silver to one of gold. Whenever silver bullion can be exchanged at the mints for legal tender silver dollars worth 100 cents, that moment 412½ grains standard silver will be worth 100 cents, and, as commerce equalizes the prices of all commodities throughout the world, whenever 412½ grains standard silver is worth 100 cents in the United States, they will be worth that everywhere else and cannot be bought for less.

Legislation to demonetize silver has given an unjust increase to the value of gold at the cost of the prosperity of mankind, wheat and all other agricultural products which have ridden side by side with silver. While the Sherman act of July 14, 1890, was the device of the enemy to prevent the restoration of free coinage, and is greatly objectionable because it continues the practlcal exclusion of silver from the mints, and reduces it from a money metal to a commercial commodity, nevertheless its repeal without the restoration of free coinage would stop that expansion of our currency which is required by our growth in population and business and widen still further the distance between the two preclous metals, thus making the return to bimetallism more difficult, greatly increase the purchasing power of gold, still further break down the price of the products of the farmers, laborers, mechanics and tradesmen, and plunge still further all commerce, business and industry into such depths of wretchedness as to endanger the peace and endurance of free institutions and the very maintenance of civilization.

We therefore, in the name of the republic and of humanity, protest against the repeal of said act of July 14, 1890, except by an act restoring free bimetallic coinage as it existed prior to 1873. We suggest that the maintenance of bimetallism by the United States at a ratio of 16 to 1 will increase our commerce with all the silver-using countries of the world, containing two-thirds of the population of the world, without decreasing nur commerce with the natlons which buy our raw material, and will sooner compel the adoption of bimetallism by the nations of Europe than any other means.

We assert that the unparalleled calamities which now afflict the American people are not due to the so-called Sherman act of 1890, and in proof thereof call attention to the fact that the same evil conditions now prevail through all the gold-standard world.

We are convinced that, bad as is the state of affairs in this country, it would have been still worse but for the Sherman act, by which the nation has obtained, to some extent, an expanding circulation to meet the demands of the continent in process of colonization and the business exigencies of the most energetic and industrious race that ever dwelt on the earth, and we insist upon the execution of the law without evasion so long as it is upon the statute books, and upon the purchase of the full amount of silver each month for which it provides, the end that the monthly addition to the circulating medium the law secures shall be maintained, and we would call the attention of the people to the fact that in the midst of all the troubles of the time the value of the national bond and the national legal-tender money, whether made of gold, silver or paper, had not fallen a particle.

The distrust is not of the Government or its money, but of the banks, which have, we believe, precipitated the present panic on the country in an ill-advised effort to control the action of Congress on the silver question and the issue of bonds.

We invite the bankers to attend to their legitimate business and permit the rest of the people to have their full share in the control of the Government. In this way they will much sooner restore that confidence which is so necessary to the prosperity of the people.

It must not be forgotten that while the boards of trade, the chambers of commerce, the bankers and money dealers are worthy and valuable men in their places, the republic can more safely repose upon the great mass of its peaceful toilers and producers, and that this, "a business man's age," is rapidly exterminating the business men of this country. The time has come when the politics of the Nation should revert, as far as possible, to the simple and pure condition out of which the republic arose.

We suggest for the consideration of our fellow citizens, that the refusal of the opponents of bimetallism to propose any substitute to the present law, or offer any plan for the future, indicates either an ignorance of our financial needs or unwillingness to take the public into their confidence. We denounce the attempt of the unconditional repeal of the Sherman law as an attempt to secure gold monometallism, in flagrant violation of the last national platforms of all the political parties.

The committee also recommended that the convention immediately appoint a committee composed of a member from each State and Territory, to act in conjunction with the American National Bimetallic League, to devise a plan and provide ways and means for impressing upon Congress and the people the impendlog perils from the final demonetization of silver.

Tests of Mine Safety Lamps.

At the last meeting of the Central Mining Institute of western Pennsylvania, William West, a mine foreman, engaged at one of the Frick plants in the Connellsville region, read a paper on safety lamps, of which the following is a digest:

After the Mammoth explosion the H. C. Frick Coke Company abolished the open lights in all its mines in the Connellsville region below water level, causing at that time a demand for safety lamps in excess of the supply. The result was the putting of a great many poorly-made lamps on the market. At the Frick these inferior lamps have been replaced with better-made lamps, and at the present time our pillar and stump drawing is being done with lamps having a metallic cover over the gauze. The common Davy lamp is still used by the fire bosses for examination purposes only.

For the last couple of years I have been anxious to have the Davy and Clanny lamp tested in a strong current of explosive mixtures and see for myself whether or not the burning gas could be blown mechanically by the current through the apertures of the gauze before its temperature was sufficiently reduced to prevent the ignition of the gas on the outside of gauze. I was also anxious to see if a red-hot wire gause would fire gas on the outside of the lamp and cause an explosion. During the last summer we had conditions favorable for getting some practical information on the subject.

A captive feeder in the bottom at the entrance of a chute between a couple of parallel butt headings furnished the gas. The first test was made with a common Davy lamp in daily use; the velocity was 5½ feet per second; the flame on the lamp wick was half an inch in length; the gas burned in the lamp until the gause became red hot and fired the gas on the outside of the lamp. A Clanny lamp without a shield was then tried in the same current; four times out of six the flame on the lamp wick went out, but the gas kept on burning in gauze above the glass cylinder and would have made the gauze red hot and caused an explosion on the outside of the lamp if it had not been removed. In the other instances the flame in the lamp became extinguished when the gas exploded in the lamp. The Davy lamp was then fitted with a new gauze, carefully examined with a magnifying glass, placed in position and the velocity increased to nearly 11½ feet per second. The gas on the outside of the lamp fired almost as soon as the gas and current were turned on, making a clear case of the flame being driven through the gauze and firing the gas and causing an explosion. The Clanny lamp without a cover over the gauze was then tried in the same current, and twice in succession when the gas fired in the lamp it went out; on the third trial, before the lamp was placed in position, a handful of fine coal dust was sprinkled over the gauze, and with the turning on of the current about half a peck of coal dust was liberated at the windward end of the box in a direct line with the lamp; here the result was a violent explosion of the gas and dust on the outside of the lamp, the color of the flame was changed to a dark red, the chute was filled with sparks, and when the lamp was picked up the glass was found to be badly cracked. I had no means of ascertaining the percentage of gas present. The barometer was 28.86 inches 280 feet below the surface. Normal temperature of mine temperature was 57°, increased to 83°; average water gauge was 1.46, or about one-half inch.

It appears that the safer a lamp is the nearer it comes to being useless for light-giving purposes. The metallic cover around the short gauze interferes with the free burning of the lamp, from the fact that it prevents the free supply of fresh air and the consequent free outflow of the burnt gases, and the result is the lamp becomes very easily choked and extinguished.

During the months of August and September I made 100 tests with firedamp and coal dust combined under different conditions, and while I am not yet a believer in the "no firedamp present" theory in our mine explosions, I had proof enough to convince me that coal dust has been playing an important part in our past mine explosions, and that in our future mining operations coal dust should be regarded with almost as much dread as firedamp itself.

Popular Disinclination for Manual Training.

In a recent conversation on manual training, says *Iron Age*, one who is interested in the management of a small trade school complained bitterly of the unexpected difficulties he met with in obtaining the consent of parents for their boys to attend the manual training class provided for them. The school in question is designed to cultivate a taste for handicrafts in the younger lads of the eastern district, New York. The idea is to prepare the boys for eventually joining one of the more advanced trade schools with a view to entering some useful and remunerative mechanical trade, such as carpentry, painting, plumbing, sheet-metal working, etc. Instruction is gratuitous, and the hours are so arranged as not to interfere with the daily work of boys who may be in other employments. Everything is done to interest them by providing lectures and entertainments, in addition to the practical instruction. But, notwithstanding these inducements, the parents, although mostly in the poorest circumstances, do not care to have their children trained for manual labor. Their preference is that they should learn book-keeping, or in some other way be fitted for clerkships or kindred occupations There is a foolish and mistaken notion abroad, particularly among the poorer portion of the community, that there is a sort of "gentility" surrounding work in an office or a store which is not to be found in manual labor at the bench or the lathe. These silly people's ambition is to see their boys dressed in black coats, with nice white hands and linen instead of bearing the marks of honest and ennobling labor in a manual calling. They are not far-sighted enough to look ahead into the future prospects of either kind of work, and it is a difficult matter to persuade them that the best interests of their children mostly lie in the opposite direction to that toward which they incline.

Parents cannot understand that in training as mere writing machines or counter servers they are launching them on a market which is and always will be overstocked, while in fitting them for skilled labor they give them an education which, provided their moral and mental qualities are reliable, will insure for them steady and well-paying employment in the present, with the prospect of early independence and a position when they have reached the upper rounds of their trade ladder, to which not one in ten among the more stylishly appareled crowd of clerks can ever aspire. The pecuniary advantages, present and future, of the skilled workman in such trades as are taught in manual training schools are in this way infinitely superior to those attaching to the average run of clerkships. But beyond and above this consideration there is, when rightly understood, a dignity and an ennobling character about the labor of the hands which recommends to all honest and right-thinking minds as a thing to be admired, and which does not exist to the same degree in the so-called genteel occupations to which so many misguided youths of the poorer classes are devoted. The "dignity of labor," although a term too often prostituted to unworthy purposes by demagogues and agitators, so that to some noses it has acquired a stale and canting odor, is yet as true a phrase as ever gained currency. This grand expression needs to be put up in its rightful position in the sight of all the rising generation who may be inclining to bow at the shrine of kid-gloved stiff-collared gentility to the disparagement of the claims of honest and heaven-blessed manual labor.

Gold Mining in New South Wales.

Mr. J. M. Findley, of Sydney, N. S. W., managing owner of Mitchell's Creek Freehold Gold Estate, Wellington, and director of the Sunlight gold mine and the Bingera gold mine, writes as follows to the Sydney *Herald:*

Looking through the annual report of the Mines Department for 1892, recently issued, one is struck by the crucial state of affairs in the industry of gold mining which is now disclosed by the accounts for the year. It appears that the number of miners employed on gold in New South Wales is 9049 (as against over 23,000 employed in Victoria), as follows: Alluvial—3502 Europeans, 528 Chinese; 4030. Quartz—5019 Europeans. The outturn of gold was: Alluvial, 33,962 oz. 11 dwt. 21 gr. (8 oz. 8½ dwt., say 38*l.* 13s. 11d. per man); quartz, 118,149 oz. 8 dwt. 4 gr. (23 oz. 10 dwt., say 84*l.* os. 3d. per man). The total value of gold produced was 555,188*l.* 7s. 6d. (61*l.* 7s. 1d. per man); the area of auriferous ground worked was 1691¼ square miles; the number of quartz reefs proved to be auriferous is 769; the value of machinery is 570,143*l.* (an average of 63*l.* to every man in the industry); the average value of gold per oz. was 3*l.* 13s. (nearly). Though the average production per man for the year is only 61*l.* 7s. 1d. (or about half a man's wages) the proportion produced in quartz mining (viz., 84*l.* os. 3d. per man) is less unsatisfactory than that in alluvial (38*l.* 13s. 11d. per man). As alluvial is virtually extinct as a commercial undertaking (though in places it no doubt still pays some isolated fossickers), while quartz mining may, by dint of prudence, be worked into a remunerative industry, the present consideration may be confined to the latter.

The results of last year show that, taking the average value of gold from quartz at 3*l.* 11s. 6d. per oz. (which is perhaps rather over than under the value of this class of gold, on the average of the colony) the production (118,150 oz.) was 422,386*l.* by 5019 men (an average of 84*l* os. 3d. per man). Granting that the whole of this large body of men was employed for only nine months out of the twelve, their wages (putting managers, engineers, miners, truckers, etc., all together) at 50s. per week—which is the general wage for miners alone throughout the colony—amount to 489,352*l.* This shows a deficiency, on wages alone, of almost 67,000*l.*, and taking all other expenses (supplies, etc.) of carrying on the mines at two-fifths of the amount of the wages—a proportion shown by the accounts of most mines—viz., 195,740*l.*, the net loss last year of carrying on this industry appears to have been 262,740*l.*, apart from the interest on plant valued at over half a million pounds sterling. The moderate rate of 5 per cent interest on the latter would bring the loss up to 285,545*l.* In other words, every 1*l.* worth of gold raised is costing at least 1*l.* 13s. 6d. to get, and some beneficient beings are finding at least 97*l.* 10s. a year in wages to each of the 5019 quartz-miners, who return only 84*l.* apiece, leaving 67,000*l.* of their wages and 262,000*l.* odd of expenses to be provided from outside sources. The serious question arises, "Can this possibly be carried on in these times?" Money has been spent more lavishly up to the present than it is likely again to be, and has in the majority of cases been spent with the acme of imprudence on perfectly unworthy claims. Hence the shocking average result. If the industry as a whole does not at least produce the wages of the workmen. it must come to a sudden end so far as 750 out of the 769 quartz reefs in the colony are concerned. From a general point of view the only apparent solution of the difficulty is to reconstruct the industry by discarding from work the myriad of small reefs (which will hardly ever make an adequate return on capital), and by disciplining the labor and centering it on those which can be worked on a large scale, enabling them to assure the workmen of permanent employment, and to show a margin of profit. Through the volatile disposition of the New South Wales miner of the present day, it is oftentimes difficult to get those claims properly worked which would pay. The plentitude of money in recent times for prospecting and company-mongering purposes has made him nomadic in his habits and ever prone to undervalue steady work, and pursue an intangible fortune in the faith that syndicates will infallibly arise to finance his efforts. The balance-sheet of the prospecting of the past should surely now teach him to look to surer means of a livelihood. As money cannot be expected for love nowadays in gold mining, the business has necessarily to be gone about in cold blood like any other, and must show profits to justify its existence. By a judicious working for the next few years (on strict principles) of the larger claims there is a fair prospect of such creditable profits being shown as will restore confidence in the industry. At present the public in the colony capitalize it only to a limited extent, and those outside show justifiable disinclination to embark further funds on an apparently unpayable and vexatious undertaking. Where is the gratuity of 262,000*l.* to come from this year for these 5000 miners? The general wage looked for by miners in this colony (2*l.* 10s. per week) is virtually prohibitory to almost any self-supporting mine, and must inevitably undergo some abatement. As this is 5s. a week more than the standard wages in Victoria, where mining is successfully pursued, and as our claims are so much less productive than those in Victoria, the difference might not unreasonably be the other way.

Outlook in East Kootenay.

W. Pellew-Harvey, of Golden, who had the commission from the Provincial Government for assaying all specimens of ore sent from British Columbia to the World's Fair, was in Nelson this week looking over the country.

Referring to the outlook in East Kootenay, Mr. Harvey, in an interview with the *Miner* reporter, said: "A great deal of interest is being shown in mining matters in East Kootenay. On account of the low price of silver and the probabilities of good discoveries of gold quartz, this interest will probably be stimulated. The ores of East Kootenay carry silver in paying quantities, and invariably carry gold to some extent, if not always in paying quantities.

"The McMurdo basin, named after Archie McMurdo, one of the pioneer prospectors of the district, has been known for a long time to contain vast quantities of auriferous quartz. Some of the veins have been developed to a considerable extent. In one instance, on the International claim, situate at the extremity of the basin and near the Duncan river country, there have been taken a number of samples of 200 pounds each, which averaged in gold $108 to the ton.

"On the Bobbie Burns claim a great deal of work was done last summer by John E. Askwith, of Ottawa. He went to a great deal of expense in developing the property and erected a mill upon it, but lack of experience made the results less satisfactory than they should have been. The ore is a ferruginous quartz and assays $26 in gold, and it is supposed that as they proceed with the working arsenical pyrites will be found, which in previous assays carried gold in paying quantities.

"There are several other claims around these mentioned which have been bonded this season by persons representing London syndicates as well as local capital, showing that the monied men are beginning to realize that the gold properties in East Kootenay are worthy of attention, more especially so when the distance is not more than 20 miles from steamboat connection and about 18 miles distant from the main line of the C. P. R.

"On the Vermont creek, several claims have been worked, and ore is being produced and shipped. Last year Messrs. Wells and Pollock realized a handsome profit on several carloads of good silver-lead ore which was shipped to the Tacoma smelter. They are prosecuting work more vigorously this summer and expect to become steady producers.

"At the Thunder Hill mine great activity prevails. Some 45 men are engaged and 100 tons of ore are being mined daily. It is expected that the shipment of the concentrates will be made in the course of a week or two, and that from this time forth the mine will bear the reputation of being one of the first dividend-paying mines in the Kootenays.

"On the North Star 20 men are employed and several hundred tons of ore are already on the dump ready for transportation. The probability is that this summer, under the able management of L. C. Hill, the force will be considerably increased."—British Columbia Miner.

Mining in America and England.

It is interesting to note in foreign papers what visitors to this country, who are now here or have recently been here in numbers to see the World's Fair, have to say of America and its industries. Mr. Emerson Bainbridge, who has just returned from America, says that from information and observation he believes that the American mining industry now is very much as the English coal industry was 30 or 40 years ago. That is to say, Americans are able to do a large quantity of mining at shallow depths or in the hillsides, working seams of considerable thickness, and they are able to bring to bear upon this kind of mining, which has almost ceased to exist in England, all the experience and appliances of the last 30 years. The result is that a number of mines are producing coal at a cost, including everything, of about 3s. 6d. per ton, which is far below the average of the best English collieries. Mr. Bainbridge thinks it is at present premature to refer to the general conclusions he arrived at with regard to the development of mining machinery, but, generally speaking, he came back satisfied with the comparison he was able to draw between England and the United States. Unless the present high cost of producing coal in England is brought down, Mr. Bainbridge has little doubt that America will gradually develop the exportation of machinery to foreign countries, and that correspondingly England, which has long held the foremost place in this respect, will fall away. The general result of Mr. Bainbridge's enquiries with regard to the working classes in America, is that the margin between their earnings and expenses enables them to have more of the necessaries of life in spite of the extremely high cost of rent and clothes; but while the wages are decidedly higher, in many cases double what are paid in England, the workmen and workwomen have very long hours and work very hard for the wages they get.

Repairing a Train Wreck.

Under the above caption the New York *Sun* says:

Every traveler has heard the musical tapping of iron hammers upon the car-wheels as his train has stopped at some intermediate station on a long journey. Of all the sounds that assault the drowsy ear of the midnight traveler, this, perhaps, is the one that most clearly penetrates his consciousness. The heaving breath of the engine for the moment at rest, the querulous creakings with which the cars settle down into stable equilibrium upon their springs, and the confused shuffling of feet that echoes through the dim-lit vault of the almost deserted station, all make small impression upon the transient alien pausing in his half-slumbrous flight across the continent; but the clank of iron upon steel calls up a vision of the long murky aisles without, and carries with it the comforting consciousness that somebody is alert against the perils that beset the traveler in the darkness. The men whose duty it is thus to sound the wheels for possible defects belong to the car-repairing gang, and are known to their fellow-craftsmen of the railway service as "galvanizers," a sort of cant term now of unknown origin, but of clearly defined application. Whenever there is a wreck on the road, whether of freight or passenger cars, the galvanizers are among the first men called upon to go forth and do battle with the difficulty. They, with the trackmen, and such skilled mechanics as may be needed in rare emergencies, constitute the wreckers, so called because it is their duty to undo the evils that wrecks have wrought.

Whenever the ordinary citizen thinks of a railway wreck, he has a vision of passenger coaches in chaotic heaps, engines ditched, and passengers killed or wounded. Whenever a railway employe speaks or thinks of a wreck, his mental vision pictures broken freight cars off their trucks and merchandise spilled along the track. This difference of conception arises from the fact that the general public seldom hears of any but passenger wrecks, while the railway employe knows that for every such wreck reported, there are perhaps a dozen freight wrecks, news of which never gets beyond the ears of the railway workers. In spite of the tales of horror that the railways furnish, passenger wrecks are really unusual, while a freight wreck of greater or less magnitude occurs every day in the year upon every considerable line of railway in the United States. The freight wreck is the expected thing; the passenger wreck is the lurking horror in the rearward of every railway man's imagination. When the news of a freight wreck comes in, the first thought of the responsible officer is to get his track cleared, that the business of the road may go on uninterrupted. When news of a passenger wreck arrives, the overmastering thought is for the safety of the passengers. Men are hurt and killed in freight wrecks, but the members of a freight crew know how to look after one another in such emergencies, while a passenger wreck with serious loss of life or the injury of many persons presents a problem quite beyond the power of any single passenger crew.

The first duty of the crew at the scene of a wreck is to flag the wreck far enough on each side to protect it from other trains. Then all hands are set to caring for the dead and wounded, and some one is detailed to communicate with headquarters. The first man there to receive the news is the train dispatcher. He notifies the superinteodent, the roadmaster, the engine dispatcher and the yardmaster. The responsible man at the scene of the wreck has indicated as nearly as he could just what has occurred. If there has been serious injury to human beings, surgeons are dispatched at once, perhaps ahead of the wrecking train. Meantime, the superintendent, roadmaster, engine dispatcher and yardmaster co-operate. The galvanizers are called together, and so are several trackmen. If a bridge be involved, carpenters and other mechanics are detailed for the wrecking expedition. The dimensions of the bridge are known down to the smallest timber and bridge plate, and identical parts are ready to hand for loading on flat cars, aod providing the means for temporary repairs after just such accidents. New ties are within reach as well, and perhaps a flat car is ready laden with enough rails to lay 200 or 300 feet of track. The roadmaster bids his men load whatever other track material is needed. The yardmaster details a shifting engine with crew to make up the wrecking train, and head it in the right direction, and the engine dispatcher calls out a suitable eogine to drag the train. The telegraph operator nearest to the wreck is ordered to the scene, and the section men of that section are called up. Care is taken that the wrecking train shall be amply provided, and the men bring their dinner pails.

All these preparations occupy considerable time, for it is well to start out thoroughly equipped, even if the wrecking train lose an hour in making ready. It thus happens that the wreckers seldom reach the scene of a considerable accident in less than two hours after the news has been ticked into the ear of the train dispatcher at division headquarters. But if the men at headquarters know their business, the wreckers arrive fully equipped for any conditions presented hy the wreck.

The approved order of a thoroughly equipped wrecking train on reaching the scene of its work is derrick car, flat car with materials, engine, tool car, wrecking caboose and tool caboose. The train starts out with the engine ahead, but is made up in proper order at the siding nearest the scene of the accident. The immediate wrecking essentials of the train are the derrick car with a single derrick in the center, to that with one at one end or with one at each end. The elaborate steam-derrick cars now in use upon some roads are not in high favor with the veterans of the wrecking crew. The steam derrick depends upon main strength where deftness aod manual diplomacy, so to speak, would hetter serve the purpose, and it has an awkward way of goiog over to the enemy by breaking down in the midst of its work. The tool car is a perfect little arsenal of the wrecker's war material. It is a covered car, with a door at each eod and a door at each side. A clear passage is maintained between the doors. Ropes neatly coiled occupy a considerable space at one end of the car. They are usually of three diameters. On the sides of the car above the ropes hang blocks, hooks and the like, and space is kept in the same end of the car for hand and hydraulic jacks, the latter being the little giants of the wreckers' outfit, so marvelous is their strength in proportion to size. Two men may carry a jack that will easily lift one end of a prostrate engine. On the other side of each door is a box for chains. In a cellar underneath the car are stocked iron track tools, and in the roof of the car many shovels are stuck. The tools are all classified according to their uses, and each class is kept separate from all other classes. Those most in demand are placed at the most accessible points, and those that will certainly he needed at once are stowed on the front of the derrick car. Among the smaller articles are linked couplings of several sorts, blocks of curious shape, parts of blocks, canvas sacks for stowing merchandise, and grain scoops for picking up spilled grain. One of the most important tools is the horse and saddle, a device used for balancing a car over the rails while trucks are being thrust under. The tool car has a system and neatness that would delight the eyes of the careful housewife. Nothing is thrown in merely because it might be useful. There is no rubbish and no waste of space. The flat car attached to the derrick car has, besides ordinary track material, several pairs of trucks, aod in the cellar beneath a complete telegraphic outfit and a stove in sections.

As the wrecking train approaches the wreck a flagman is encountered. He is relieved by a flagman from the wrecking train, and the latter proceeds. The wrecking foreman, once on the ground, establishes telegraphic communication with headquarters, lays out his work so that no one shall be idle, and then begins at those portions of the wreck immediately within reach. The dead and wonnded, save in the worst accidents, are already cared for, and the business of the wrecking crew is merely to clear up the debris and open the line. The wrecking foreman must first decide upon the relative value of time and material. If a great railway is blocked by a dozen wrecked freight cars, the immediately important thing is to get them out of the way; but if the mass of the wreck is made up of highly valuable material it may be worth while to work more slowly and save the pieces. It was the old fashion to hasten such work with fire, but the modern rule is that no car shall be burned. In fact, an officer of the road is at hand to note the number and condition of every car involved, and all must be accounted for when the wreck has been cleared up.

All cars detached from the main body of the wreck, but hindering travel, are, if possible, put upon their wheels and rolled to a siding. Then the nose of the derrick car is thrust as close to the heart of the wreck as seems advisable, and the real work of clearing up begins. The wrecking foreman signals the engineer of the wrecking train, aod the latter must be ahle to move his engine a yard or an inch, as the signal indicates. All signals come from the foreman, and at nlght he is distinguished hy a lantern of special color. The rule is to clear one track if there be two, and thus make way for traffic. It may be necessary, however, to build a track around the wreck. The track repairers are at hand for this. They also repair the track under the advancing wheels of the derrick car as it eats its way through the wreck. If need be, rails are cut in two, so that a few feet may be gained without waiting until a full length of rail may be laid down.

There are a thousand and one devices to accomplish with ease and safety the work of the wrecker. If a single car lies across the track, impeding travel and supporting a mass of wreckage outside the rails, the wrecking foreman promptly determines whether or not he shall cut it in two, drag away the part across the track, and leave the remainder to support the wreck. Toppling cars that lean threateningly toward the track must be thrown over or propped up into stability. The wrecking train seldom or never carries an outfit for extinguishing fire, but the wrecker has his own peculiar mode of meeting the difficulty presented by a burning wreck. If, as usually happens, there is small hope of quenching the flames with water, the next resort is to scatter the burning material. A pair of car wheels is placed behind the wreck. A chain is passed over the burning mass and attached to the wheels. Then the other end of the chain is attached to the engine, and the wheels are dragged like a great dumb-bell right through the wreckage. As they come through they scatter the burning material from right to left, and by the time this operation has been repeated once or twice the flames have almost disappeared.

The derrick handles derailed cars and engines with marvelous ease. The track-repairers level the ground about the prostrate car or engine, if it be down an embankment build a temporary track down to it, and then let the derrick car get to work. The hydraulic jack usually comes into play in turning car or engioe upon its feet, but the derrick, with the horse and saddle, does the work of placing a car upon trucks. The derrick reaches round for a truck from the flat car, drops it on the temporary track, lifts one end of the car until the horse and saddle may be shifted under it, and, when a truck has been rolled under one end, lifts the other so that a second truck may be put in place. This done, the car is dragged up to the main track and run upoo a siding. An engine must be handled with greater care, and a skilled mechanic is usually at hand to see that no harm comes to its mechanism. Passenger cars need like care, because, although strong below the windows, they are flimsy in the roof. Air brakes and easily removable parts of the engine are taken off hefore the lifting begins.

All the ingenuity of the wrecker is called into play when a wreck lies at the bottom of a river, and sometimes days, or even weeks, are required to get an engine from such a predicament. Once engine and cars have been set upon their feet, a length of track laid upon a raft is sunk beside them. Other lengths of track are added; banks, and even river beds, are graded, if need be, and in time the wreck is triumphantly dragged ashore upon this temporary track.

When the work of a wrecking crew at a given point is finished, all the useless debris is burned, and such cars as will run are coupled, so that they may be hauled home for repair. The wrecking crew leaves the scene with the track smoothed out and traffic re-established. As to the wrecking train, it reaches home with all its paraphernalia in place, its ropes neatly coiled, its surplus material piled in proper order, and all things in readiness for just another such emergency.

Lixiviation of Ores in Australia.

The Australian *Mining Standard* says: Amid all the prevailing depression it is pleasurable to be able to mention one instance of success after years of patient industry. This is to be found in the case of the Pinnacles mine, Silverton. The mine is well known to investors as one io which the imposition of an excessive royalty kept back development and checked enterprise. In view of the disadvantages under which the subsidiary company worked, it is astonishing that it has survived until the present time. The record of the mine is similar to that of a dozen others. Unsuitable machinery was purchased, and it was only when hard experience had shown that wrong methods were being relied on that the management got on to the true course. The lode is a lead sulphide ore with a very small percentage of zinc, and with fair silver contents. Concentration has been mainly employed for the treatment of the ore, but the cost of transit of the concentrates and loss in manipulation rendered the process unprofitable. This experience is similar to that of the White Rock mine, where, from the time the concentrates left the mine until a return was obtained, the cost was £8 per ton of concentrates. In addition, the loss in treatment was 56 per cent, obtained despite the possession of extremely fine appliances. At the Pinnacles carriage amounted to 27s. 6d. per ton to Port Adelaide—a small item compared with that incurred at White Rock. The proposal now is to treat the large heap of tailings at the mine, the contents of which average some 11 or 12 ounces of silver per ton, by the hyposulphite of soda leaching process. The gentleman responsible for the successful application of this process to the Pinnacles ore is Mr. C. H. Beaumont, an ex-student of the Ballarat School of Mines. He has proved unmistakably what has already been learned in the United States—that leaching under conditions such as exist at the Pinnacles is the handiest and best method on which to have reliance. His experimeots were made on a parcel of ore containing 11 ounces of silver to the ton, and he saved 1098 ounces out of a total of 1170 ounces in the parcel of ore haodled by him. The loss, therefore, was only 72 ounces, which, considering that the tests were not made uoder the best of conditions, was extremely low. The value of Mr. Beaumont's experiments lies in the fact that he has demonstrated to Australians the worth of lixiviation. Every metallurgist knows that, once the roasting is done properly, the rest of the process is comparatively simple. The labor required is not skilled, and to that extent leaching compares somewhat favorably with amalgamation, where the percentage of trained men employed must he larger. The only fear we have now is that the price of silver will preclude working the mine at a profit. Doubtless Mr. Beaumont will be able soon to state the cost to which he will be put per ton of material treated, and demonstrate whether he will be able to make a profit even at the present depressed rates.

Japanese Minerals.

M. Daniel Bellet states that Japan is a country particularly well endowed with natural resources, and singularly favored in the wealth of her mineral deposits. Essentially volcanic, she not only possesses thermal resources of the most varied description, but her sub-soil contains valuable mineral deposits, and therefore it is not surprising to find the working of Japanese mines dating back to remote ages. In the seventh century there are records of mining operations, gold being worked in the province of Moutsou, iron in Bichin, and copper in Monchachi. The methods of extraction and of treatment of the ores were of course, at that period and have since remained until a very recent date, of the most primitive description. Latterly, however, perfected systems have been introduced.

If, M. Bellet says, an examination be made into the condition of the mining industries of 1878, a period at which the government prepared a series of returns showing what the resources of the country were, it will be found that 514 mines were being worked. In 29 of these mines gold was being sought for, silver in 46, copper in 91, iron in 53, lead in 8, tin in 10, antimony in 2, coal in 186, sulphur in 13, sulphate of iron in 8, and alum in 9. As regards the yield of these various mines, according to estimates which have been made, gold was annually extracted representing a value of £52,000, the silver extracted being valued at £78,000. In the case of tin, the figures were respectively 75 tons and £600, and lead 185 tons aod £4255. The iron mines yielded 5000 tons, representing a value of £18,000, and the copper mines 3000 tons, valued at £180,000. The coal mines furnished 390,000 tons annually, the approximate value of which was £390,000.

Iron ore is, it appears, found in great abundance under the form of magnetic iron, and one of the most important sources of supply is the Hei mine, which extends for several leagues and is of unknown depth. Mines of importance are also found in the provinces of Iwalsi and Kodzulse. The ores, and more particularly copper pyrites, are found in great profusion in the provinces of Rikontschiou and Ongo, aod the same may be said of lead ore, at any rat in the north of the country. Tin ahounds in the province of Satsuma, Boungo and Souvo; antimony in Ise and Hiouga. The principal coal mines are those of Karatsou and Talsasima, in the province of Hizen. Mention should also be made of the coal of Amakousa and that of Yeso. The latter island, it is said, contains a carboniferous basin of great richness and of enormous extent.

Brannt's Varnishes, Lacquers,

Printing Inks and Sealing-Waxes.

JUST READY.

Varnishes, Lacquers, Printing Inks and Sealing-Waxes: Their Raw Materials and their Manufacture. To which is added the Art of Varnishing and Lacquering, including the Preparation of Putties and of Stains for Wood, Ivory, Bone, Horn, and Leather. By Wm. T. Brannt, Editor of "The The Techno-Chemical Receipt Book." Illustrated by 39 engravings.

In one volume, 12mo, 388 pages, price $3.00, by mail, free of postage to any address in the world.

ABSTRACT OF CONTENTS. — I. Introduction. II. Raw Materials. III. Oxidizing Agents (Driers). for Converting Oils into Siccative or Boiled Oil. IV. Dissolving, Roasting and Distilling of Resins. V. Preparation of Siccative or Boiled Oil. VI. Preparation of Oil or Fat Varnishes. VII. Preparation of Volatile or Spirit Varnishes and Lacquers. VIII. Miscellaneous Varnishes and Lacquers. IX. Manufacture of Printing Ink. X. Fabrication of Sealing-Wax, Appendix. The Art of Varnishing and Lacquering. Index.

Price $3.00, by mail, free of postage, to any address in the world.

☞ *A Descriptive Circular, 2 pages, quarto, giving the full Table of Contents of the above volume, sent free to any one who will furnish his address.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

Scientific Press **Patent Agency.**

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

Mechanical Progress.

Broken Propeller Shafts.

An interesting series of letters has lately appeared in our contemporary *Fairplay* on broken propeller shafts. We also recently noticed a patent brought out hy Mr. Mudd, of the Central Marine Engine Works, Hartlepool, for the protection of that part of the propeller shaft between the hrass liners. The inventor cases the bare shaft with an India-rubher coat, and thus prevents the water from attacking this part. We have had many plans before us from time to time to overcome this difficulty, says *Industries and Iron*, and we will attempt to describe what we deem to be the hest of them.

The covering of the whole length of the shaft with brass liners is undouhtedly the most effective way of preventing corrosion; hut the expense and the extra weight is very considerahle. Many objections are raised even to this mode of protecting the shaft, and mainly on account of the difficulty often experienced in getting the joints of the liners perfectly tight. This objection can, we think, however, be got over by careful workmanship. We have seen a shaft thus cased which, on being stripped after many years wear, looked as good as when the liners were put on. It would, however, he well to thoroughly explain the manner in which this was done.

The liners, being bored to the size for shrinking on, should be heated internally hy means of a Bunsen flame, and at the same time it is hetter to allow the liner to rotate so as to ensure equal expansion. When the proper temperature has heen reached the liner is placed in its position on the shaft and cooled in the usual manner, by allowing water to run on it and at the same time causing the shaft to revolve. When cooled the liner is turned true at the ends, and it is checked or stepped down to rather more than half its thickness, and for a width of about 1½ inches at the end where liner No. 2 is to be placed. This liner is then bored for shrinking and recessed to suit the liner fixed on the shaft. After heing heated as before, it is placed on the shaft and the junction of the two liners immediately chilled, which is hest done by providing a ring of iron harrel drilled with small holes so as to play on the joint. The remaining portion of the liner is, however, only cooled slowly. By this means the union must he effective, as liner No. 2 nips the other and thus prevents its drawing off, as was usual in the old mode of procedure. Each liner is treated in a similar way until the shaft is fully coated. We have no hesitation in saying that although this may be an expensive way, it properly done as described, it is absolutely effective.

Another way of arriving at the same end is to case the shaft with a brass tuhe, if the shaft he small in diameter. If too large for this, a sheet of hrass can he rolled up to the proper diameter, hrazed together and slipped on the shaft, after the latter has heen well coated with red lead paint, the liner being recessed to receive the tuhe. It must of course he understood that the brass tuhe is placed in position first, the end liner heing afterwards shrunk on over it, cooling the point of junction as before. On a long length of shafting there would require to be a numher of these tuhes, and they can hest be fitted hy shrinking a short liner on the shaft at the end of each. This will ensure a thoroughly good joint.

We have often wondered why, in single-screw engines, the stern tuhe has not heen dispensed with entirely. According to Lloyds' Rules, the after-peak of a steamer is made in the tank form and water-tight, so that should the shaft break and the stern tuhe he fractured, water will not enter the ship, but will only fill the after-peak tank. Given such a state of precaution, it seems unreasonahle to suppose that a stern tuhe is unnecessary. Provision can he made when horing out the stern post to put in the usual wood liner within the hrass one, and if it is thought advisahle, a stuffing-box and gland could be fitted on the inside of the post. The hulkhead at the fore end of the propeller shaft would he fitted, as at present, with the ordinary stuffing-hox and gland. The bare shaft could always be seen on opening the manhole in the top of the tank, and as this tank has the usual sounding pipes, it would be easy to ascertain if there were any large increase of water in it due to leakage of the gland. There would also be the drain-cock on the bulkhead as at present fitted, as it would be requisite to allow a little water to leak in at the after gland, in order to luhricate the packing, but no more need be admitted than is necessary to prevent undue heating. We suggest that this mode of construction does away with the use of the stern tube, and it ensures the shaft heing seen at any time the engineers may think fit, as it need not he done in dry-dock. It further ensures that the shaft is not in water all the time it is running, a state of affairs that at present exists with the ordinary stern tuhe. Many ohjections may he raised—such as that the space is confined, difficulty of access owing to the run of the ship, and various other causes of like nature; hut we venture to think that the shipbuilder and engineer, between them, would speedily find a way out of the difficulty, and devise a ready means of finding a practical solution to what does not appear to he such a very difficult prohlem.

We throw out these hints in the hope of their bearing fruit, and we shall he pleased to give puhlicity to any ideas which we may receive hearing on the suhject.

A Machine-Gun Feeder.

Dr. R. J. Gatling, whose revolving machine gun has attained a world-wide reputation, has applied a feeder for the gun, which renders it still more convenient aod useful than ever. It seems to he a perfect machine gun now. On a strip of tin, says the Hartford *Times*, are placed 20 smokeless-powder cartridges, each held in place hy hits of the tin that are turned up for the purpose. These slips are put into a horizontal opening, and, as they are drawn through, the cartridges are stripped off and placed in position to he thrust into the chambers. The motion is positive, and there is no failure in any part of the movement.

The old plan was to drop the cartridges into a vertical opening, and they were carried by gravity to their proper position. It will he seen that by this old method the gun could not be used when pointed upward or downward, except to a moderate degree. But with the new invention the cartridges are held in place in whatever position the gun is held, horizontally or perpendicularly, or at any angle. Each one of the old feeders cost $2.50. The new tin strips cost but two cents each. The new system shields the cartridge from the rain.

There is another advantage. The strips with cartridges attached can he compactly packed, and a much larger amount of ammunition can be carried with the gun than hy the old way. The gun can he fed hy these strips with the greatest rapidity. With them it has heen fired 3120 times in a minute, and when turned by a little electric motor attached to the hreech it can be fired 5000 times a minute.

The ingeniously contrived movement of this revolving gun works as easily and smoothly as the simple rolling of a wheel. It is a wonderful piece of mechanism, wonderful for its simplicity and accurate movements, superior to all other machine guns in its principle of revolving cylinder and revolving barrels and locks, at the same time moving with such exactness that in firing over 3000 charges in a minute there is no accident, no failure in the working of the cartridges. If a cartridge is imperfect (something that does not occur once in 10,000 shots), the gun works on just as accurately as if the miss-fire had not occurred.

The small hullets used in this gun, with smokeless powder, have been fired through 40 one-inch pine boards. They can he fired two miles and then have force enough to pass through the body of a man. Dr. Gatling recently exhihited ooe of his newly perfected guns before the United States Army Board of Examiners at Springfield, and they were delighted with it. Eighteen of the new guns were ordered hy the War Department, each having this remarkably advantageous improvement in the feeding.

The feeder was invented by two of the employes of the Dwight Slate Machine Company of Hartford, Ct., by which it was developed and successfully applied to the gun. The patent will later he assigned to the Gatling Company. The Dwight Company, with the aid of the Eddy Electric Company, is now busy making an electric motor to operate the feed. The invention is a very important one in the manufacture of modern ordnance, and reflects much credit upon its originators.

Band-saws for Cold Steel.

Messrs. Noble and Lund, of the Northern Machine Tool Works, Newcastle-on-Tyne, have recently supplied and put into operation in the finishing shops of the Dennystown Forge Company, Dumharton, a powerful band-sawing machine for cutting iron and steel cold. Since starting, this machine has heen engaged cutting out the center parts from forgings of connecting rods, throw-cranks, etc., and in sawing out crank webs from the solid block. Instead of heating these slabs, from which the webs are formed, and shaping them hy means of paring helow the steam hammer to as near the size as possible for machinery, they are simply sent to the planing machine, where both sides are planed and then handed over to the hand-saw, which cuts them out to the very line, leaving them as near like the figure 8 as possihle, with its edges so smooth that not more than a little filing is required to finish the work. Although the introduction of machine tools of this type does not date back more than a few years, a very large number have been installed hy Messrs. Nohle & Lund, of sizes varying in capacity for dealing with material from 8 inches to 30 inches in thickness. For these varying thicknesses the feeds and speeds are regulated to a perfect nicety, and the following, among other things, are daily operated upon: Connecting rods, crank webs, pump levers, tail-end nuts, eccentric rods, piston rods, crossheads, cutting studs and hoiler stays to length, etc., thus dispensing with the tedious work of slotting machines.

The advantages attaching to this machine tool may be thus summarized: Less power is required to drive this machine than any other for the class of work performed. It dispenses to a large extent with smith's labor, which is always expensive. The cut is continuous, and consequently no time is lost in return strokes, as in slotting. The small amount of material cut away, together with the fact that the cut is continuous, enables the machine to do from two to three times the work of a slotting machine in ripping. Work of an irregular shape can be performed on this machine, which is impossible on a circular saw. A large quantity of useful scrap comes from this machine, the higher value of which, compared with the cuttings from a slotting machine, more than covers the attendant's wages. Band-saws have been in use in Woolwich Arsenal for cutting iron plates for the sides of gun carriages for more than 25 years. Messrs. Thornycroft & Co., of Chiswick, have recently heen experimenting with one for cutting out the webs of crank shafts, and it is quite possible the idea has quite a satisfactory future before it.—The Engineer.

Scientific Progress.

Ozone.

The name of ozone has a very peculiar fascination for the puhlic. The fact is, that ozone is considered as a mysterious agent, to which all sorts of marvelous properties have been attributed about which many "fairy tales" have heen told in hooks and puhlications, some of which hear scientific repute. Another popular impression is that ozone is a new product that has only lately come within the ken of scientific men. How far from the truth this helief is is shown by the fact that, in a lecture now heing prepared on the subject of ozone by one of the leading electrotherapeutists of America, over 130 authorities are quoted, some of which date hack hundreds of years.

Although the virtues of ozone have occasionally been exaggerated, there is no denying that it can render many valuable services, not only for therapeutic or sanitary purposes, but in chemistry and in several industries. The employment of ozone will quickly become more general when it will be possihle to compress it and sell it in cylinders, as carholic acid and oxygen are now sold.

The commercial uses of ozone are innumerahle. It is useful in hleaching, as it destroys organ colors, especially in wool, cotton, vegetahle fiher, paper pulp, oils and ivory. The improvement of wines and spirits by ozonization is now commercially applied. Light wines, however, cannot be ozonized, unless the operation is conducted with the greatest care, hecause a too strong treatment gives rise to the formation of aldehydes and vinegar. The expense in ageing and refining alcoholic liquids in this way is trifling, as a very small quantity of ozone is required.

Among the physiological uses of ozone, the most important is the purification and disinfection of air and of tapestry hangings in sick rooms and in ships. In the British Museum and several public buildings in London, where large numhers of people congregate, and where the miserable arrangements for ventilation are a disgrace to a civilized community, a successful attempt has recently been made to render the air less poisonous hy the introduction of ozone. It is more than likely, too, that as soon as the difficulties which now attend the making and application of ozone are reduced, it will be freely used in churches and other places of worship, in which whole congregations now become inattentive and sleepy, often more from the impurity of the air than from the dullness of the sermon.

Ozone is also an insecticide and can be used for the destruction of caterpillars and beetles. The influence of ozone in this respect is seen on passing a supply of it through a flower pot in the earth in which some worms have heen placed. The worms almost immediately force their way to the surface. This experiment has induced some people to try to destroy the insects which cause so much damage to vines, and to have some iron pipes in the vineyards, through which ozone was forced, so as to kill the phylloxera microbe. But this will only he practical when ozone can be stored and compressed, as well as produced and sold cheaply.

As showing the effect of ozone on animals it is related that a factory was infested with rats and mice, hut as soon as it was utilized for manufacturing ozone the animals completely disappeared. The time will shortly come when the drinking water of all cities will be suhject to the action of ozone, hy which many of the ordinary bacteria, such as those of typhoid, cholera, etc., and their spores are killed. Sewerage water, or water contaminated by the refuse of works, will also he treated hy ozone, not only for the killing of hacteria and the docomposing of the ammonia into its constituents, hut for the simultaneous oxidation of all the organic suhstances in suspension.

Among the legions of uses of ozone may also be mentioned the manufacture of ferments for hreweries and distilleries and the preparation of yeast where the expulsion of hacteria leaves a pure ferment and prevents after-fermentation.—Tradesman.

Electroplating as a Fine Art.

For many years past, electroplaters have sought to evolve an effective process of electro-deposition on a non-metallic base. This endeavor was at length attended with partial success, hut the process was accompanied by so much danger, in consequence of the highly combustihle nature of some of the agents employed, that manufacturers did not care to run the risk of setting their premises on fire. A modification of the processes has heen discovered by which this danger is avoided, and the invention is now pronounced to be one of the most important that has heen introduced in the electroplate trade for many years. The object to be dealt with, whether it he a sprig of natural holly or ivy, a bit of common hedge hriar, a fern, geranium leaf, Marguerite daisy, or a terra-cotta group, it is suhmitted to the process, which is the inventor's secret. It next receives a deposit of copper, which renders it perfectly ductile and practically indestructihle, and it is then ready to be either silvered or gilt by the ordinary process of electroplating. This invention comes from England, where it is being largely employed in ornamental work of various kinds. Some of the effects produced hy it are said to he exquisitely heautiful. For instance, cracker, glove and trinket hoxes and drinking cups are twined around with sprays of ivy or holly, the veining of the leaves and the sharpness of the prickly edges of the holly heing as perfect as they were in their natural state. To other articles lace is added in a similar manner, and, while all the delicate gossamer appearance of the lace is preserved, its character is so changed that it has become metallic, and may be removed whenever the article which it embellishes requires cleaning. In the same way the ornamentation is applied to the backs of hair brushes and an infinite variety of other articles, the materials used being natural leaves and flowers. Terra-cotta ware can be treated by the same process, and, when bronzed, makes attractive ornaments, which cannot readily be hroken. —Pittshurg Dispatch.

The Saponification of Mineral Oils.

It is now known that by the action of sulphuric acid in conjunction with oxygen gas the naphthene hydrocarbons may he compelled to undergo a partial oxidation. The practical utilization of the products fully confirms this statement; moreover the noxious or hituminous substances ohtained have heen found to be oxygenated by the results of their chemical analysis. A theory has heen proposed which accounts for the existence of the solid or bituminous constituents in crude oil by oxidation under pressure in the interior of the earth. These products appear to enter into solution in the oil—at least to some extent. The presence of natural oxidation products in mineral oils, according to a recent statement hy R. Haack, increases the tendency of the oils to oxidize when treated with sulphuric acid and oxygen. From this he deduces that in working fractions it is hest to deal with those fractions which are obtained by treating the naphtha residue with superheated steam. Taking the mixed fractions which have a specific

gravity of about 0.900 and heating them with sulphuric acid and manganese dioxide, which air is forced through under pressure, there will, he says, result a product of which when purified by distillation with water in vacuo, 60.80 per cent is directly saponifiable with alkalies. The product thus exposed to air loses to a considerable extent its property of saponification; increase of temperature also brings about changes in the oils and causes them to separate from combination. Haack asserts that a soap made by observing proper precautions from mineral oil will be found to be as valuable as any soap yet made from animal or vegetable fats.—American Manufacturer.

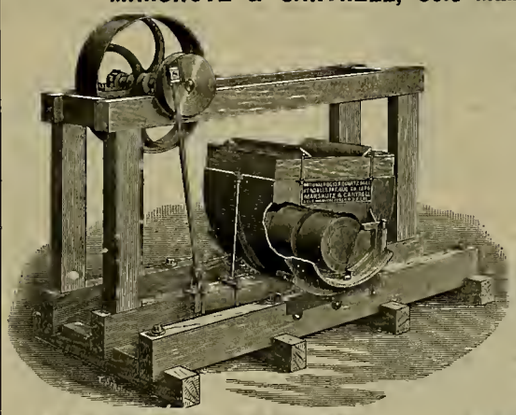
NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT. AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.


The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.
We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.
Send for Circulars and Price List. MARSHUTZ & CANTRELL.

THE BLASDEL CONCENTRATING BELT COMPANY.
We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

BOOKS ON ASSAYING.
BY C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.
Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Useful Information.

Different Kinds of Leather.

Very few people have any idea of the number of different animals which contribute their skins for the adornment of pocket-books, purses, etc., and make up the large number of odds and ends which people find so useful, says the *Trunk and Leather Review*. Monkeys, pigs, goats, snakes, lizards, alligators, sheep, calves, fish, seals and even birds all contribute.

The great majority of these skins are imported, as labor is so cheap abroad that the manufacturers here find that, even with the duty of 20 per cent on the finished leather, it is cheaper than importing the hides without duty and having them tanned here.

The one thing of importance in leather for fancy leather goods is the grain, which influences the price to a very great extent. The number and variety of grains are large, and the different leathers are classified when received accordiog to the size of the grain under these several headings—fish, morocco, grosgrain, levant, turkey, monkey, pig and seal. These grains are all different sizes, the monkey being the largest, although the pig and seal are very pronounced.

The fish grain is the smallest of all. Besides these leathers there are a great many imitations made—buffing, which is a split cowhide, and skiver, which ls a split sheepskin.

But these can be easily told, as what is called hand grain is the natural grain of the skin, touched up by hand, whereas the ordinary imitations are embossed by machine.

Several other grains made by machinery on skiver or buffing are called boarded, being made by a brass tool which gives fine straight lines close together, the others showing wavy effects or water lines on the skin and the dice grain.

The most expensive leather sells from $100 to $110 per dozen skins. This is the genuine Russian leather, which has of late temporarily lost popularity. It is in grosgrain. Levant goatskin sells for $60 a dozen skins. Seal sells for $30 to $50 a dozen, and pigskins are sold by the skins at $6.50 or $7 each. Monkey skins are cheaper, selling at $3 per skin; but these latter are very hard to procure at any price. They are made up by only one or two manufacturers that we know of in America into the very finest grade of leather novelties of the imported skins. With the exception of the sealskins, which are tanned in England, nearly all these skins are tanned in Germany, although sheepskins are tanned in France.

A very ingenious imitation of Russian leather has been made of calfskin, perfumed with oil of birch.

It is a dangerous counterfeit, for the reason that the color ls exactly the same, and the appearance and odor very much so, often puzzling the untutored buyer. Time, however, destroys the false odor and reveals the imitation.

The most important thing now, and the latest, ls to have the leather novelties which women carry to match their dress in color.

Fortunately, the houses which import leathers to this country used to send samples of leathers to Germany and elsewhere to match, so as to strike the exact color. Now, silk, cotton stuffs, plush, etc., are sent instead.

Lizard skins come largely from Borneo, as well as Germany.

How Boats Are Made of Paper.

A wooden model is prepared in exact form of the desired boat, on which the paper is molded, sheet after sheet being superposed until the desired thickness is obtained. In process of construction, nine thicknesses of strong manilla paper are laid on, making a thickness of about one-eighth of an inch. The lines of the boat are carefully drawn full size, and the paper—which comes from the mills in rolls—is cut to the full size desired for covering the entire length and breadth of the boat, so as to have no joint whatever. For racing shells the best manilla paper is used, but for gigs, dingeys, canoes and skiffs, paper made from undressed linen ls used. In manufacturing the racing shells the first sheet is damped, laid smoothly on the model, and securely fastened in place by tacking it to certain rough strips attached to its upper face. Other sheets are now superposed and suitably cemented together, the number depending upon the size of the boat and the stiffness required. Should the surface of the model be concave in parts—as in the run of boats with square sterns, for instance—the paper is made to conform to these surfaces by suitable convex molds, which also hold the paper in place until dry. It will then retain the desired form.

The model, with its enveloping coat of paper, is removed to the drying-room. As the paper skin dries, all wrinkles disappear, and it gradually assumes the desired shape. Finally, when all moisture has been evaporated, it is taken from the mold an exact counterpart of the model desired, exceedingly stiff, perfectly symmetrical and seamless. The boat, as it then appears, is waterproofed, the frames and fittings completed, and the boat varnished. The advantages possessed by these boats over those constructed of wood are strength, stiffness and durabllity; and, beiog without joint, lap or seam, they do not admit of leaking by strain or shrinkage. They do not crack or split, never shrink, and, paper being one of the best non-conductors, no ordinary degree of heat or cold affects them, thus rendering them admirably adapted for use in all climates.—Work.

How Diamonds Are Cut.

The first operation in the art of diamond-cutting is that of splitting, or cleaving. The process consists in determining the proper plan and direction for dividing the stone to give it the final shape it will assume, without needlessly sacrificing any of the weight of the stone. On the sound judgment and skill of the splitter—qualifications gained by long experience—the future of the stone depends. He decides how the stone must be shaped so as to retain the highest weight with the most brilliant effect. He examines it for flaws and defects, and must be able to know to a certainty whether the imperfections are at the surface or in the heart of the stone. Having made his decision, he proceeds to work. The rough stone is imbedded in cement and a dull edge diamond is rubbed across its surface, so as to leave an indentation that determines the line of cleavage. The operation is then repeated with a diamond having a slightly sharper edge, and finally one as keen as a razor. A marked depression is thus made, into which a sharp steel knife is inserted. A quick and light blow divides the stone into two parts. It is now removed from the cement; the main part is then replaced in the cement and another fragment is split off, and these operations are repeated until all the flaws are removed and the stone has received the proper outlines of the form it is destined ultimately to take on. The fragments are all carefully preserved, to be cut into tiny gems, and for other uses.

The next operation is that of cutting, during which the stone receives its finished outlines. This work is still almost entirely done by hand. The cntter has two diamonds attached by cement to wooden handles, and a box in which to collect the diamond dust. The cutter must laboriously grind the two stones together in order that by their mutual attrition he may develop, from the primitive form received from the splitter, the facets of the brilliant or rose form that the stone is required to take. This work requires great muscular force, and the hands of the cutter must be protected by stiff gloves of leather.

To Avoid Colds.

"There are two very simple ways of avoiding pain and colds," said Henry McIntosh, who is at the Southern. "One of these is to shut your eyes and the other is to shut your mouth. The man who comes out of an over-heated room, especially late at night, and breathes through his mouth, will either catch a bad cold or irritate his lungs sufficiently to cause considerable annoyance and unpleasantness. If he will just keep his mouth shut and breathe through his nose, this difficulty and danger are entirely avoided. Nine chills out of every ten are the result of people talking freely while out of doors just after leaving a room full of hot air, and theater-goers who discuss and laugh over the play on their way home are inviting sickness.

"It is just the same with regard to shutting the eyes. Every man who travels a long distance gets dust or something worse in his eye occasionally, and proceeds to take every one's advice to get it out, sometimes rubbing it, and sometimes pulling one lid over the other. The next time you get a speck of dust or metal in your eye just shut it and keep it shut for over a minute. Nature will then come to your relief, and there will be enough tear-like moisture to get rid of the obstruction, which will be found in one of the corners when the eye is finally opened. The worse of these two prescriptions is that they are entirely too simple. Mankind loves martyrdom in connection with medicine or surgery."—St. Louis Republic.

CONCRETE, as a material for engineering works, has, until within comparatively recent years, been chiefly confined to harbor works, but lately it has been used in the construction of railway works, both at home and abroad. The advantage of employing this material is apparent in districts where the absence of good bullding stone or clay for the manufacture of bricks makes the cost of masonry or brick structures very great.

How to go to Sleep.

The activity of the brain is in direct proportion to the amount of blood contained in the vessels of the brain, and anything that lessens the amount of blood in these vessels will induce sleepiness, while the greater the flow of blood the greater will be the flow of ideas. This is comparatively a new discovery, for it used to be held that much blood in the brain caused sleep. Dr. William Hammond has, however, demonstrated the fallacy of this latter idea by a description of the results obtained by experiments with instruments of precision, one of which was his own invention, which showed that the flow of blood to the brain was coincident with the degree of mental activity displayed in the subject.

If a person lies down, thus allowing the blood to flow more readily to the brain, and cannot sleep, let him get up, sit in a rocking chair and throw his head back and he will probably go to sleep very quickly. Some people have found by experience that they can sleep better after eating, and the doctor explained this by saying that the blood not heing able to be in two places at the same time and having to go to the stomach to digest the food has to leave the brain, and therefore sleep follows.

Some people are more active mentally when lying down than when sitting up, because of the greater flow of blood to the brain. Dr. Hammond described a machine which would produce sleep whenever desired. It is something like a pair of carpenter's pinchers with rubber balls at the end. All one has to do is to screw it to one's neck, thus stopping the flow of blood, and one can go to sleep at will, or shut off one's train of thought.

WALL PAPERS were little used in Europe before the eighteenth century, though they had been long before that applied to house decoration by the Chinese. Those that were first manufactured in the west were adaptations of design from Italian hrocades, and at first they were used in an unobjectionable manner, just as hangings of the costlier material were employed, namely: To fill spaces between obvious structural lines; and so applied, no objection could be made to thelr use. On the contrary, the invention brought it within the means of every householder to fill blank wall spaces with agreeable tracery and harmonious color.—Ex.

THE Chinese laundryman knows a little ironing trick worth trying. Instead of heating his iron just right for use he heats in scorching hot; then he plunges it into cold water for an instant, which cools the surface sufficiently to allow him to make several effective passes, the heat meantime gradually returning to the surface. If necessary he repeats this two or three times till the iron is of the right temperature to ply its vocation uninterruptedly. This saves the frequent changing of irons of Bridget's method.—Exchange.

TOOTHACHE perhaps nnmbers as many victims as headache, and is looked upon as quite the type of severe and wearying pain. Attention to cleaning the teeth, care not to use them as universal tools for cracking nuts and biting off threads, and so chipping the enamel and inviting decay, are good preventives of toothache. It is also wise to go to the dentist betimes and have hollow teeth stopped. A good digestion and avoidance of unwholesome food are great helps to preserving the teeth.

Electricity.

Storage Battery Patents.

With the expiration of the Spanish patent on the storage battery, terminating as it does the life of the American patent, it is to be hoped that the litigation will cease and work on the development of the accumulator be taken up. It is to he regretted that so much time should have been devoted to wrangling over patents that were really of no particular value to their owners. All the time and money spent by the pioneer storage battery companies in this country might better have been devoted to the development of the battery and introducing it to the public. Great stress was laid on the Faure process, and it was contended that a practical storage battery could not be made by any process that was not covered in this patent. But its owners were helpless in view of the fact that the Brush patents, which were equally valuable, were controlled by a rival concern. These corporations have been engaged in a bitter controversy for several years, and it is sincerely to be hoped that Judge Coxe's decision last week will end the senseless fight.

This decision is a ruling on the questlon of the life of an American patent being affected by the expiration of a foreign patent on the same invention. It appears, according to the judge's finding, that Faure's invention was patented first in France (October 20, 1880), afterwards in Spain (June 27, 1881), and finally in this country (January 3, 1882). The Spanish patent was for ten years, the full limit allowed for an invention that had already been patented in a foreign country. Oo the hearing recently conducted in the United States Circuit Court for the Southern District of New York, it was contended by the American owners of the Faure patents that the invention patented in Spain was not the same as that covered in the American patent. This claim was not allowed, as it was pointed out by Judge Coxe in his decision that there was every reason to believe that all three patents were for the same invention. The apparent dissimilarity in the claims were explained by the fact that Faure, being a Frenchman, wrote his original application and description in French and that they were afterwards translated into English and Spanish. Making allowance for philological differences, for errors and unavoidable changes in translation, and for dissimilarities in Patent Office procedure, it would hardlv be expected that the United States and Spanish patents would emerge from such an ordeal in identical garb, even though it were the avowed purpose of the inventor to make them the same. It was claimed in the hearing that Faure had patented one invention in France and another ln Spain, and that the French and the United States patents were on the same invention. This, however, is improbable, as the term of the Spanish patent shows. Had the invention, which the Spanish patent was intended to cover, been an "original invention," that is an invention that had not before heen patented in any foreign country, it would have been entitled to protection of the Spanish patent laws for 20 years. As a matter of fact, the application was made for a 10-year patent, showing that it was the belief of the inventor that he was applying for a patent on the same invention as that covered by the French patent. This is the view taken by Judge Coxe, and it seems to be supported conclusively by the evidence.—Western Electrician.

Mr. Edison Hates a Telephone.

"What makes you work?" I asked with real curiosity. "What impels you to this constant, tireless struggle? You have shown that you care comparatively nothing for the money it makes and you have no particular enthusiasm in the attending fame."

"I like it," he answered, after a moment of puzzled expression, and then he repeated his reply several times as if mine was a proposition that had not occurred to him before. "I like it. I don't know any other reason. You know some people like to collect stamps. Anything I have begun is always on may mlnd, and I am not easy while away from it until it is finished. And then I hate it."

"Hate it?" I asked, struck by his emphatic tones.

"Yes," he affirmed, "when it is all done and is a success, I can't bear the sight of it. I haven't used a telephone in ten years, and would go out of my way any day to miss an incandescent light."—From C. D. Lanier's sketch of Thomas A. Edison.

A SPECIAL ELECTRIC WELDING CAR has been constructed at Philadelphia for welding street railway rails in position. The car is provided with an electric welding plant, so constructed that current is taken from the trolley wire and transformed into a low-tension current of desired strength. Experiments have been made at Johnstown, and rails of great length have been formed, avoiding the use of fishplates and joints, at the same time obviating the necessity of bonding the track for the return circuit. On the West End Company's track a girder rail, 25 inches square section, was welded wlth 100-horse power, and the usual rails require less power. The time taken is from four to sixteen minutes for a complete weld. The rails are welded in places by removing the paving and making contact after connection to the terminals of the welding machine.

THE MYOPHONE.—M. Brown Sequard has recently addressed a communication to

the French Academy, in which he describes an important discovery of M. d'Arsonval. It has generally been assnmed that the electric excitability of muscles ceases shortly after death. This statement is true as far as their ability to contract is concerned; but all such observations have entirely failed to take account of muscular movement of feehle intensity. In order to stndy these muscnlar vibrations, M. d'Arsonval has for several years employed a magnetically adjustable microphone, which he calls a "myophone." This instrument produces a sound long prior to a nervous excitation snfficiently powerful to create a visihle muscular contraction. By means of this apparatus, M. d'Arsonval has been enabled to prove that a nerve remains alive for hours after death. This is easily demonstrated hy attaching, say, the Archilles' tendon of a guinea-pig or a rabbit to the myophone and then exciting the sciatic nerve by means of a current intermitting 50 to 100 times a second. Snch tests show that the nerve can and does act upon the muscle, without necessitating its visible contraction, and that a distinct muscular vibration takes place. It also proves that a nerve dies much slower than has been currently helieved.

ELECTRICITY AS A PURIFYING AGENT.—Electricity seems to be coming prominently to the front for use in purification processes. It has been successfully introduced in France and England for purifying sewage, and if worked with a refuse destructor, in which the heat can be used for generating the current, it is thonght it will be found not only more satisfactory hut more economical than existing methods. In Germany an electrolytic process for purifying mercury for use in very accurate work is coming into general use. A new method of bleaching starch by electricity is also reported, by which, it is said, second and lower qualities of the product can be treated electrolytically, so that they compare favorably with the first quality. Methods of manufacturing ozone by electrical action are also well known. In fact, it seems as if the electric current was destined to play a very important part in the sanitary engineering of the future.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Voltaic Mineral Rods.

Important to Miners and Treasure-Seekers. Send Stamp for Circular to E. A. COFFIN, No. 47 Bristol Street, Boston, Mass.

WELL MACH'Y *All Kinds, Water, Gas, Oil. Mining, Ditching, Pumping. Wind and Steam: Heating Boilers, &c. Will pay you to send 25c. for Encyclopedia, of 1500 Engravings.* The American Well Works, Aurora, Ill. also, Chicago, Ill.; Dallas, Tex.; Sydney, N. S. W.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

THE IRMA.—Amador *Record*, Aug. 3: It is less than 12 months since the first work was begun at the Irma mine under the direction of C. Shea and David Fisher, the former being general manager and the latter superintendent. To-day the mine is paying its own way and more too—a rapidity of development almost unprecedented in California mining history. But one can readily understand the secret of this phenominal success by visiting the locality. There has been no filigree work about the operations. Everything from mine to office is of the plainest and yet of the most substantial character. The head managers live and lodge just as well and no better than their men. Every one about the mine, manager, superintendent, foremen, men above and below ground, each and all work as though they took an equal interest in the success of the undertaking. Sixty men are now employed directly and indirectly about the mine—30 underground and the balance on surface and timber work. The working force is being added to from time to time as circumstances will permit. No liquor is sold in or around the camp. The Irma folks, as well as employes and the balance of the population in Pioneer district, are strenuously opposed to any liquor business getting a foothold in the camp.

A NEW MILL AT THE IRMA.—Amador *Record*, Aug. 3: A new and powerful air compressor for the Irma has been shipped from the East, which will enable them to operate three additional Ingersoll drills. This will make a total of five drills driving ahead work underground. The company has not erected any mill yet, but a daily output of 16 tons of ore is crushed in a Bingham roller mill owned by Charles Gracey. This mill is a new invention, and is the first and only one ever built. It works very satisfactorily, both as to the amount of power requisite to operate it and the effective manner in which it reduces ore. The invention is an undoubted success and will be heard from. Two Frue concentrators are also connected with the plant. The Irma ore yields 15 per cent of high-grade sulphurets. There are many things concerning the Irma that space forbids us to speak of this week, but, as this is to be a continued story, our readers will hear something further upon the subject. There are several prospects in that immediate locality which look equally as promising as the Irma did six or eight months ago. These we will speak of in detail in another issue.

THE CLINTON.—*Ledger*, Aug. 4: Street rumor has it that Superintendent Rogers received about a thousand dollars last Friday night with which he intended to pay off some of the labor bills at the Wieland mine, but that, as that amount would not pay more than one-third of the indebtedness, he concluded to await the arrival of the attorney of the mine—Samuel Shortridge—who is expected up daily with the money to settle up the entire indebtedness of the company. Attorney Shortridge and R. P. Wieland arrived in Jackson Wednesday night and went on to Wieland yesterday morning. Mr. Shortridge is attorney for the Clinton Consolidated Company and came up to look over the financial condition of that concern. He says that every dollar of indebtedness will be paid, and that in all probability work will be resumed on a larger scale than ever before as soon as the affairs of the company are again put in shape.

REDEEMING THE AMADOR GOLD MINE.—*Ledger*, Aug. 4: Last Saturday Vincent Neale and James E. Dye redeemed the Amador gold mine property, which was sold by the sheriff six months ago for about $9000. Mr. Neale represents the corporation known as the Jackson Gold Fields. The sheriff's deed to the property cannot pass for 60 days, and the American Company is still in possession with its armed guards.

FOR A WATER WHEEL.—*Ledger*, Aug 4: T. Dodd, the inventor of the Dodd water wheel, was in Jackson during the week looking over the Alma mine with an idea of securing a contract from the company for the Union Iron Works.

ALMA GOLD-MINING COMPANY.—*Ledger*, Aug. 4: The Alma Gold-Mining Company has been incorporated for the purpose of sinking a shaft in and prospecting the ledge which runs through the Mattley field about northwest and southeast, which is the same ledge the Kennedy is located on. The company propose to sink the shaft 500 feet without crosscutting. The capital stock of the company is $1,000,000, composed of 200,000 shares at $5 per share. The directors of the company are Geo. B. Heazelton, president; J. N. Wells, vice-president; D. Gutman, secretary; W. B. Hamilton, H. H. Bodwell and J. B. Francie. Mr. Francie will be the superintendent of the property. The machinery will probably be run by compressed air, the compressor being placed on the creek, and conveying the air to the mouth of the shaft on the hill. The compressor will be run by water power, the water being taken from the top of the hill, which will give a pressure of 240 feet. They propose to get to work in 10 or 15 days. The company has sufficient money on hand to successfully prosecute the work it has planned.

Butte.

LIVELY MINING TOWN.—Marysville *Democrat*: W. W. Lemon of Forbestown, says the people of that mining town are in a prosperous way, in fact they are entering a stage termed a boom. The greatest trouble they find at present is in not being able to get good-seasoned lumber as fast as required for building. The Stow mine is keeping a 40-stamp mill at work continuously, and the Nickerson mine has a good 10-stamp mill at work. In a few days the Hayward mill commences the crushing of quartz and ore, of which there is a large quantity all ready for use. This will keep 30 stamps pounding away night and day hereafter, making 80 in all.

Calaveras.

THE JONES MINE.—*Mountain Echo*, July 29: The Jones mine, situated at the month of Carson creek, seems to be coming to the front as a gold-producer. The mill is kept going steadily, with good results. Drifts are being run and every effort is being made to develop the mine. Mr. Roberts is entitled to much credit for the splendid manner in which he has managed this property. His economical mode of managing the mine is sure to make it a success in the end.

THE PARTICELLI MINE.—W. T. R. writes to the *Chronicle* from Deer Lodge Camp, Aug. 1: The crosscut in the Particelli mine, 200 feet from the month of the tunnel, has been pushed in 34 feet to the hanging wall. Four feet of quartz was found on the hanging wall that will mill possibly $5 per ton. My company henceforward will develop the property by sinking a vertical shaft east of the ledge, with a view to encountering the vein on the 500-foot level. The order is here to commence the sinking, and accordingly I have started the shaft. It is the intention of the company to erect a water-power hoist next month.

AT THE HOLLAND.—*Citizen*, Aug. 5: The Holland mine is progressing rapidly. Sinking is steadily going on, and the hum of the mill is daily heard. Everything in and around the mine is working well, and its effect can be felt in our whole community, as quite a number of men are employed, and at every regular payday your money is there, enabling the employes to get their money, which is put in circulation, thereby causing smiles among our citizens.

STRIKE IN THE LINDERAXA.—Calaveras *Chronicle*, Aug 5: A large body of rich quartz has been struck in the Linderaxa mine about two miles from this place and owned by Tynan & Vandell. A tunnel has been run on the mine a distance of about 200 feet, at the end of which a winze has been sunk a distance of about 50 feet. Tynan & Vandell started a crosscut west about ten feet down from the top of the winze, and, after running eight feet, struck the vein, which is exceedingly rich, the quartz carrying free gold in large quantities. It will be a few days before the width of the vein is known, owing to the fact that other developments will have to be made in the mine before the work of crosscutting can be continued, but there is not the least doubt but that Tynan & Vandell have struck a regular bonanza.

Humboldt.

LOCATIONS FILED.—*Advocate*, Aug. 5: Mr. J. C. Bush has filed for record notice of location of the Bush placer mine and Mr. Lewis J. Nelsen notice of the location of the Lewis Nelsen mine, both in the Redcap mining district. There was also placed on record in the office of the Auditor and Recorder this week a deed from P. L. Young and J. A. Pearch of 20 acres of land near Pearch's creek and the Klamath river.

THE GOLD BLUFF PROPERTY.—Blue Lake *Advocate*, Aug. 5: Announcement comes that the recent sale by Mr. John Chapman to Nevada mining men of the Gold Bluff property means the immediate vigorous prosecution of operations there. It is learned that while Superintendent Coffin, the owner, will have general supervision of the work at the mine, operations on the beach will be in charge of Mr. Edward Ellis of Arcata, whose familiarity with all that appertains to the working of it renders his services well nigh invaluable. New machinery will be put in and no expense spared in the effort to make it pay. Mr. Hightower, also a Nevada man, will be associated with Superintendent Coffin in the working of the auriferous sand.

Mariposa.

MAY BUY A MINE.—Mariposa *Gazette*, Aug. 5: Mr. M'Caw of San Francisco, accompanied by several practical mining men, arrived here Wednesday on their way to Hite's Cove. Mr. M'Caw was here several weeks ago and made a close inspection of that once-noted property. Mr. Hite is waiting at Pine Glen until Mr. M'Caw returns to determine whether or not he would purchase the mines. So much valuable machinery is lying idle in the Cove, and so much gold is known to exist there that it is very sad to think of the inactivity which prevails. The working of the Cove property means so much to this county that all of us will anxiously await the expert's decision.

Nevada.

TO REOPEN THE STOCKTON.—Grass Valley *Tidings*, Aug. 4: The Stockton mine, located on Dawson Handy's ranch, about ten miles south of Grass Valley, is to be reopened by Sacramento and local capital. The mine has paid well in the past and a shaft 120 feet deep has been sunk on the property. Four thousand dollars were extracted from one "pocket." J. H. Burrows, a mining man from Colorado is to be superintendent.

TO WORK THE PINE HILL.—Grass Valley *Union*, Aug. 7: A number of practical miners who have secured a bond on the Pine Hill mine, located in Rough and Ready township, met last night at the office of Justice Paynter and elected Thos. Loney, president; S. T. Jones, secretary, and Chris Loney, treasurer, of the company. The mine has been bonded from the owners, Messrs. Thrasher, Riddinger & Co., and active work will be at once commenced. It is proposed to drive a tunnel and tap the ledge 150 feet from the surface. Crushings of ore extracted from the mine have yielded at the rate of $7 to the ton. Even at this low rate the mine can be worked at a profit. It is a good prospect.

BRIGHT PROSPECTS.—*Transcript*, Aug. 7: The Badger Hill quartz mine, in Cherokee district, was started up last week. There is a shaft 100 feet deep on this mine at the bottom of which there is a good ledge. Drifts are being run from the shaft, and the prospects are very flattering. As soon as the drifts are opened sufficiently, which will not be long, a much larger force of men will be employed. The last crushing paid $20 per ton, and the quartz now being taken out looks much better than the last lot. The mine is owned by an English company. There is a good hoisting works and rig on it. David Keskeys is the superintendent. There are several prospects in that vicinity that are looking well.

LOOKING FOR MACHINERY.—*Tidings*, Aug. 4: Stephen Moore, superintendent of the Home mine, on Deer creek below the Champion, was in Grass Valley on Wednesday looking for machinery to put on the mine. Mr. Moore formerly resided in Grass Valley, and for a time had charge of the North Star mine. The Home Company, we understand, will put up its works on the opposite side of the creek, not far below the Providence mine.

A NEW DEIFT.—Nevada *Herald*: The Odin Company are now running a drift for their main channel, a job which will take about two months and a half. The gravel now coming out is improving and averages $1 per carload. When the drift is completed the machinery is to be rearranged, and various changes will be made.

NEW GRAVEL MILL.—*Herald*: Oscar Brown is almost through with the new mill at the Kate Hayes mine, French Corral, and is now building a tramway for it. The mill is a heavy one, with ten 1000-pound stamps and a six-inch cam-shaft. It is calculated to grind up the cemented gravel which escapes the elevator, in a thorough manner. Mr. Brown expected to have the mill ready for business by the 10th inst.

Placer.

BIG SALE OF MINING PROPERTY.—Placer *Republican*, Aug. 4: News has just reached us of the sale of the Three Stars and other mining property in the Ophir district to a Denver company. The sale is by Mr. B. F. Hartley, and includes the Three Stars mine, the Belle Hamlin mine, the Lamhert & Rhoades mining property and the Almont mining property. The purchaser is the Colnmbia Gold and Silver Mining Company of Denver, Colo. The deed was made on June 27th, and was filed for record in the recorder's office here on the 26th of July. This is one of the largest sales of mining property ever made in the county, and the many friends of Mr. Hartley will be glad to hear of his success in disposing of his mines at such a handsome figure. This sale will have a very beneficial influence upon other mining properties in the Ophir district, and those in other sections of the county as well, and we may expect to hear of other good sales almost any day. Mining men in the silver States are casting about for gold-producing properties, and particularly quartz, and all those who are fortunate enough to own a gold-bearing quartz ledge may consider themselves possessed of a young bonanza.

Plumas.

BETTER TIMES AT JOHNSONVILLE.—*National-Bulletin*, Aug. 4: Benj. L. Jones arrived from Johnsonville Sunday evening and on Monday proceeded to the Golden Key mine at the head of Rush creek, owned by himself, M. L. Moore and Jack Owens. Three years ago the owners extracted and crushed 60 tons of ore, from which they realized $9 per ton. Mr. Moore is expected to return from Shasta county, and development work will be resumed on the Golden Key. Mr. Jones reports times improving at Johnsonville. About 30 men are employed at the Jamison mine and they are a class which help a town. The prospects for the mine seem to be improving. The Squirrel Creek mines generally are supposed to have done well the past few months.

THE FOREST GROVE MINE.—*National-Bulletin*, Aug. 4: During the past three months Messrs. Jones & Curtis have been ground-sluicing in their mine, the Forest Grove, situated about five miles west of Jonsonville. Only three men were employed in the mine, yet the cleanup amounted to $3300, nearly all of it being coarse gold, the heaviest piece weighing five ounces. This is a very respectable amount of gold to be obtained in so short a time from a small mine operated in a small way.

SUNNYSIDE DRIFT MINE.—*National-Bulletin*, Aug. 4: This property is owned mainly by Beckwith people, and is situated about nine miles southwest of Johnsonville, on the line between Plumas and Sierra counties. Three men are now at work running a tunnel to tap a back channel. This tunnel is now in 765 feet. The company expect to drift 100 feet farther and sink a shaft for the purpose of testing the depth of the channel, the rim of which was cut, but the bedrock pitched away to such an extent that a new and lower tunnel will be necessary. The gravel encountered at the rim prospected well. Prior to 1891 a break from this channel was operated as a hydraulic mine and yielded up to that time $75,000, and that at an expense of only $9000. Some astonishingly large nuggets were secured, the largest weighing $3270, another $1800, another $1500, another $1000, and several as large as $500.

MINES AND DITCHES SOLD.—Plumas *National*, Aug. 3: Last week Col. M. H. Day of Rapid City, South Dakota, purchased of the Lee Bros. of this place, the Hungarian Hill mines known as the "Orr," "Lady Emma" and "Cate" claims, together with water-rights connected therewith. For several days Col. Day, and F. B. Lathrop, who is interested with him, were examining that section of country and the territory lying between it and the Bell mius. Being fully satisfied as to the merit of the property, the purchase was made and the money counted out to Mr. Lee. By securing this property, Col. Day is in a position to build up one of the most important water privileges in the county. The ditches and reservoir are to be so improved as to husband and carry a large volume of water, probably 2000 inches, which will be piped across the Spanish Creek canyon and delivered into a ditch on the north side, to be cut for the purpose of conducting it to the Bell mine, there to be used for the generating of power. Evidently the company means business. It proposes to develop its rich property. Col. Day has had much experience in mining in the Black Hills, where he is now operating a 40-stamp mill. The inauguration of work upon its valuable property means a revival of business in this part of the county.

Shasta.

EXTENSIVE COAL DEPOSIT.—Redding *Free Press*, Aug. 5: Joseph M. Frazee, a man of considerable experience in coal-mining, brought in some coal specimens this week from a mine in Trinity county which he discovered 30 years ago. While the specimens are admitedly of a poor quality, being broken from an outcropping long exposed to rain and shine, Mr. Frazee is of the opinion that a little work on the vein will develop a much better quality of coal, fit for smelting and other rough work. Mr. Frazee expressed the conviction that the vein of coal extends from the Round Valley reservation parallel with the Coast Range mountains to Coos bay in Oregon. A good quality of coal is mined at Coos bay, and there is no reason to suspect, if the vein is so extensive as Mr. Frazee is convinced it is, that some or even a better grade of coal may be found on the same zone in Trinity county. As it rests at present, it is absolutely of no value to any one, being far from lines of transportation and almost inaccessible.

TO PUSH WORK.—*Courier*, Aug. 5: Charley Albro, who was down from the Hidden Treasure mine Sunday, says that the work on the mill is being pushed ahead rapidly. The mill will be a ten-stamp one.

Sierra.

WORK ON THE LAWLER.—Forest City Cor. to *Messenger*, Aug. 5: Supt. McIntosh, of the Mt. Moriah mine, better known as the Lawler, returned a few days since from below, and on Tuesday, Capt. V. S. Snider and a Mr. Woods came up from San Francisco to inspect the works. The contracts let to run three tunnels at different depths to cut the main ledge have resulted in two of the tunnels cutting two other ledges before they reached the main one. One of these ledges was 3½ feet wide and the other 10½ feet wide, both showing free gold. On Tuesday the main lode was reached in one of the tunnels, and up to this time 3½ feet had been made and the footwall not yet reached, showing free gold all through. This lode has shown the best development of any one in the county or country so far as it has been prospected. The owners of this property can see a fortune within their grasp. Mr. Newton, superintendent of the Gold King mine, is putting up his hoisting works, and will be ready for sinking soon. This a good piece of property also. The Rising Sun mine has but few men at work, but it is thought they will soon put on a full force. This property is without doubt among the best in this section. It is generally conceded here that the South Fork mine will be opened up through the old Bald Mountain extension tunnel, which will give new impetus to our town. There are thousands to be secured for the owners through this enterprise.

Siskiyou.

QUARTZ AND RIVER-BED MINING.—Yreka *Journal*, Aug. 2: Gould & Co., who are now working the Hegler Bros.' quartz mine on Humbug, have started the mill in crushing, and have plenty of quartz in sight to keep the mill running steadily. In fact, they have a great big ledge and a small mill, which will be replaced by a large mill if further developments show that the ledge holds out in extent as at present. The quartz prospects well, and the company expect to realize considerable gold during the present summer and fall season. The loss of the big current wheel at the American Bar claim, Klamath river, near Hornbrook, which was expected to prove a failure, has caused the company to resort to the use of small current wheels for operating the machinery, and expect to commence washing pay gravel within a couple of weeks. The wheel for working the pump is already in place, and the wheels for the derricks and sluices will be completed in a few days. This claim prospects very rich wherever the bedrock has been reached, and will no doubt yield handsomely during the balance of the season while the river is low and the weather favorable. Several more claims have been located in the new Butteville mining district on Eddy mountain at head of Shasta river, about seven miles west of Igerna, which is destined to become a flourishing district. A custom quartz mill would be a good investment, to receive liberal patronage from the various quartz-mine workers and owners in that section. The Eastlick Bros.' mine at Oro Fino has been paying better this year than usual, owing to a good supply of water. The last clean-up yielded over $15,000. The R. H. Campbell hydraulic mine in Quartz valley, bonded to an English syndicate, is also yielding handsomely, the ditches supplied from Salmon mountains furnishing an abundance of water for active operations. C. L. Smith, of Ashland, says the *Tidings*, who is working at the Centennial river mine, on the Klamath, about 30 miles below Henley, is interested in a promising location near that place—a six-foot

ledge from which $40 asseys have been obtained. The same papsr also says Col. Ewing went over to the head of Empire creek in Siskiyon county the first of the week, with ex-Mayor Grainger, to exemine the Blne Jey mine, owned by Poole & Grainger. The Blue Jay is a big ledge, in which ore assaying over $15 to the ton was struck last week. Dele & Co., who discovered a good ledge of quartz in ths mountains at head of Sheste river in this county, writes as follows to the editor of the Ashland *Tidings* concerniug its charecter: "I thought you might be interested in knowing that Dale & Co. heve strock it rich in quartz that assays $628 in gold and 39 onnces of silver to the ton. The location is ebout 30 miles from Sisson on Eddy mountain. It has raised a big excitement in this part of ths conntry. My claim is near that of H. B. Maxwell, who sent to Philip Mnllen some qnartz that went $600 to the ton. It is the most eingnlar mine I ever saw, and I cannot find any one who ever saw auything just like it. Break up a bowlder of quartz, and you find in it pockets three to five inches in diameter filled with solid metel which breaks up in cubes and ie of the color of iron sulphurets. The same stuff comes from the quertz in smaller particles when pulverized in a mortar. I seud you a sample of it in this letter. I was offered $10,000 for my claim, but declined it. I have some of the metal like I send you that will assey $1000 to the ton. We heve done only two or three days' work on our claim."

Borax ann Saltpetee.—Yreka *Journal*, Aug. 9: Reed and Whitcomh have teken up land at the lake section elong the Oregou bonndary line in Butte creek valley for mining purposes, to procnre borex and saltpeter, snoposed to exist in large quantities in that locality. The alkaline flats on the borders of the Little Klamath and Tule lakes seem to be of the same character as the horax fields of the sagebrneh plaine of Nevada and other States of the midway basin between the Sierra Nevada and Rocky Mountain ranges, and will likely produce borax and saltpeter to a great extent. The people of that section have often procured large quantities of the alkaline salt from a selt spring or marsh bordering on Little Klamath lake, for the pnrpose of feeding it to sheep, also borax in a crnde state, which they found effective in scrubing floors and cleansing, and it is possible that a good quantity of soda might be fonnd in the same locality.

Quaetz.—Boyle & Co. have beeu taking out $40 to $50 per ton lately at their ledge on head of Humbug creek, but the ledge being narrow, only eight inches wide at surface, tbey are uow running a lower tunnel to strike the heart of the lode where it is wider and will pay better at less expense. Boyle has about 18 men at work, and expects to put on more hands this week. He has also the option for a year of reopening the old Soencer mine, just below the Eliza ledge, which yielded over $100,000 nnder former management, but worked to such disadvantage that the expenses were too great. An experienced man from below, named Oliver, will examine the mine to ascertain the feasibility of running a tunnel into the mountain, as the method of sinking shafts and pumpiug ont water is too slow, tronblesome and expensive.

Blue Geavel.—The Greenhorn blne gravel claim, about a mile south of Yreka, is now paying handsomely. The miners cnt throngh a rim last week, and had to sink down three feet lower in a new back channel, which contains the same kind of rich blne cement, snch ae was realized on the first opening of the claim near Lee's dwelling-house. The indications look favorable for realizing considerable gold from now on, which everybody hopes will be the case, in order that the men interested may get back their money exnended, with good reward for their energetic and persevering efforts in the way of developing the extensive blne-gravel beds of Greenhorn creek and this vicinity, 100 feet beneath the snrfece of Yreka basin. George Graves & Co. have been meeting with very good success in quartz prospecting on Cherry creek during the past eummer, and are now working a pocket ledge that pays well, which may develop into a permenent ledge.

Trinity.

A Pesperous Season.—Trinity *Journal*: The mining eeason of 1892-3 can be classed as beiog one of the best for a great number of years. The waterfall wae considerably above the average, and the placer-miners have utilized it all, with the exception of a few heavy storms, when the water in the ditches had to be turned out in order to prevent them from breaking. In very few instances damages were reported to reservoirs, flumes or ditches. On the whole, though, when compared with those of former years, the damages were perceptibly slight, as it did not take long to repair them, and conseqnently but a few days' water was lost. Some of the mines have cleened up, showing good results. Others, with more water at their command, will not finish the season's clean-up before the latter part of Angust or the first week in September. Trinity's contribution to the gold output of California this season will be a large one—perhaps the largest for many years.

Looking at Mines.—Trinity *Journal*: S. M. Spragne and W. R. Mortou of Iowa Hill, and Geo. H. Magruder of Yuba City, prominent mining men, have been in Trinity Center for several days looking at the mines in that neighborhood, and are very favorably impressed with them. They went over to the Ward mine (recently sold to Denver and French capitalists) as the guests of P. M. Paulsen, and spent a day there. Mr. Sprague, who is a placer-miner of great experience, and the rest of the party were more than snrprised at the magnitude of this property. Mr. Sprague said he never expected to find such a mine in Trinity county, and that it would rival the famous North Bloomfield, both in richness end extent. These gentlemen are of the opinion, and correctly, too, that the mines of this county are yet in their infency.

Tuolumne.

Rich Steike Reporteo.—*Democrat*, Aug. 5: It wes reported in town Tnesday that a rich vein of ore had that day besn discovered in the north shaft of the Rawhide mine. The extent of the hody of ore or its richness could not bs learned, but it is generally accepted es true that a rich strike hes been mede.

NEVADA.

Washoe District.

Con. Cal. & Va. Mine.—Virginie *Chronicle*, Aug. 5: 1500 level—On the sill floor have reopened the main south drift a distence of 60 feet; total length reopened, 86 feet—to a point 256 feet distant from the main shaft. At a point in this south drift 256 fest from the main shaft we are cutting out a station for an upraise. Have done some repairing to the main north lateral drift from the Con. Va. shaft. 1600 level—The south drift sterted at the end of the east crosscut run east from the main sonth drift on the 1500 level, has been extended 16 feet, continuing in porphyry and quartz of a very low assey valne. Have continued the work of bulkheading end closiug the openings which connect with the old stopes in the north end of the miue where ges exists, and the escape of the gas is growing less. 1650 level—Have continued making necessary repaire to the drifts on the sill floor of this level. Heve resnmed work on the north and south sides of the drift rnn east (at a point 20 feet down) from the winze snnk from the crosscnt run west from the main northwest drift; also upward at the end of the drift run eouth from that winze at a point 52 feet down, and have extracted from all these places during the week 163 carloads of ore—about 158 tons. Have shipped to Morgan mill during the week 184 390-2000 tons of ore, the average assay valne of which (per car samples) was $36.70 per ton. The average assay value (per battery samples) of all the ore worked at the mill dnring the week (71 tons) was $33.82 per ton.

Ophie.—1565 level—An east crosscnt started from the main drift ou the sill floor of this level, at a point 108 feet south from the winze etation, hae been advanced 9 feet. Have reeumed (jointly with the Mexican Compeny) the work of making repairs to the main shaft.

Mexican.—On the 1565 level—The east crosscut from the north drift from the crosscut rnn east from the bottom of the winze, has been extended 19 feet; total length, 154 feet, in a porphyry, clay and quartz formation showing a little valne.

Utah.—340 level—The south drift from west crosscut No. 3, at a point 100 feet in from its mouth, hes been extended 8 feet; total length 37 feet; continuing in qnartzite and porphyry formation of low assay value. Have stopped work in the south drift and are removing track therefrom.

Sieera Nevada.—The intermediate tunnel on Cedar Hill has been advanced during the week 12 feet, making the total length 515 feet; the face ie in porphyry. The north drift started at a point 1520 feet west of the joint Sierra Nevada and Union shaft has been advanced 30 feet; face in porphyry.

Union Shaft.—The north drift etarted on 900 level, at a point 1520 feet west of shaft, hes been advanced 30 feet; face in porphyry.

Andes.—On 420 level eest crosscut from main lateral drift, north, was advanced 12 feet; total length, 24 feet; face in qnartz that yields low assays.

Gould & Curey.—200 level—West crosscnt No. 5, started in northwest drift, 432 feet from main west drift, hes been advanced 7 feet; face in hard porphyry; total length, 557 feet. We have also done some necessary repairing during the past week on the 200 and 400 levels. Sutro tunnel level—The joint north drift, which was started in east crosscut No. 1, 75 feet from main north drift, has been advanced 16 feet; total length, 80 feet. All work has been discontinued in this drift for the present.

Halr & Norgoss.—On 900 level have advanced the south drift 10 feet; total length, 141 feet; face in porphyry. Have discontinned work in the face of the drift and started a new west crossut at a point 41 feet back from the face and advanced the same 10 feet. Face of crosscut in porphyry. 1100 level—Heve advanced the sonth drift 8 feet; total length, 136 feet; face in porphyry. Have discontinued work in the face of this drift and started a new west crosscut at a point 76 feet back from the face and advanced the seme 10 feet; face of crosscut in porphyry. Main shaft—During the week have been easing timbers in main sheft below the 1100 level and have put in new guidee in the two hoisting compartments from the 1100 to the 1300 level.

Best & Belchee.—200 level—At a point in northwest drift, 295 feet from onr sonth boundary, we have started east crosscut No. 2 and extended the same 20 feet, passing through quertz and porphyry giving low assays. Sutro tunnel level—The joint north drift, which was started in east crosscut No. 1, 75 feet from main north drift, hes been advanced 16 feet, passing throngh soft porphyry; total length, 80 feet. All work in this drift has been discontinued for the present.

Chollar.—Are retimbering the main tnnnel on 250 level and repairing the main incline between the 930 and 1200 levels. The west crosscut from the north drift from the east crosscut near the sonth line, 930 level, is out 80 feet; face is in porphyry and clay.

Potosi.—The south drift, 35 feet west of the main shaft on the 850 level, is out 212 feet; face is in soft porphyry. The east drift, 73 feet above the 930 level, to connect with north raise from 930 level, is out 32 feet; face is in hard porphyry. The raise from the 8th floor, south stope, 1000 level, is np 21 feet; the top shows porphpry and quartz that gives fair assays. Extracted and sent to the mill the pest week 492 tons and 1250 pounds of ore from ths 550, 930, and 1150 levels. Milled during the week 530 tons. On hand at mill 123 tons and 250 pounds. Average battery assays, $24.72; average car-sample essays, $32.47. Shipped to the U. S. Miut, Carson, 885 pounds crude bullion.

Kentuck.—In the west ledge we ere stoping and saving about 18 tons of ore per day of milling quality.

Waed Shaft.—The west drift from ths station, 820 level, is out 32 feet from the shaft; face is in porphyry.

Bullion.—The west drift from the station, 820 level, Ward shaft, is out 32 fest from the shaft; face is in porphyry.

Exchequee.—The west drift from the stetion, 820 level, Ward shaft, is out 32 feet; face is in porphyry.

Alpha.—The west drift from the station, 820 level, Ward shaft, is out 32 feet from the shaft; fece is in porphyry.

White Pine District.

Oee Shipments.—The Eureka & Palisade Railroad received for transportation to Salt Leke City end Vellejo Junction, dnring July, 94 tons of ore as follows: Zoanni Bros., 40 tons; C. A. Mathewson, 28 tons; Rocco Kregnezo, 12 tons; and Ross & Siri, 14 tons.

White Horse District.

Neens Development.—The *Dispatch* says: White Horse only needs development. The Willey-Poole cleim has done its assessment work. John Hayes is working toward the Bald Eagle, and now he will not bond or sell to anybody. Dave Washeim and E. Z. Bsiley have very fair prospects in the Tiger. They are down 20 feet and still going. Four Spaniards from San Jose will start to work the Adeleide thie week, and are under contract to sink 100 feet and crosscut the same distance. Ex-Mayor Gregory of Sacramento was in town this week taking a look at the White Horse mines. He is pleased and will retnrn and do some business that way. On the Donelin-Toft claim the tunnel ie in 25 feet, and the quartz ledge is visible for 150 yards. The prospects are fine, and quantity, not quality, is desired, for the latter is assured. Mr. Schennert returned from White Horse on Monday night and went to Sacrameuto the seme evening. He has arranged the preliminaries by hiring several men to put the Jim Blaine mine in proper shepe for einking by etraightening np and timbering the shaft.

Eureka District.

Oee Shipments.—Enreka *Sentinel*, Ang. 5: The ore shipmente for July were light, es might have been expected, as the big drop in the silver market has resulted in the Diamond Company laying off their men, and general discouragement among the minere of the camp has caused a number of tribnters in other mines to qnit work and wait until something tnrns up or silver takes a raise. The Diamond people have concluded to ship no more ore under the present quotations for silver. The product they shipped lest month was broken down before the sudden drop occurred, and it is clear that it was better to convert it into bullion to be sold at the best advantage than to have it rotting the ore bins. The Eureka & Palisade Railroad Company received for transportetion to Selt Leke City and Vallejo Junction, during the month of Jnly, 346 tons of ore as follows: From Eureka district—Diamond mine, 271 tons; Richmond mine, 12 tons; Williamsbnrg mine, 16 tons; McGarry, snndries, 29 tons; and Lord Byron mine, 18 tons. Total Eureke district, 346 tons.

ARIZONA.

Goln Strike.—Mohave *Miner*: One of the biggest gold strikes made in Mohave county since the Gold Bug mine wae discovered has just come to light in Layne Springs. The Clack Bros. and Joe Pomher were doing a little work on what is known as the west extension of the Nighthawk, and when down ebout three feet from the snrface they uncovered a good-sized body of the richest kind of ore. The formation ie porphyry and tbe vein a contact. The gold in the ore is coarse and heavy and ehows np beautifnlly to the naked eye. Samplee of ore from the ledge were assayed and gave a rich retnrn.

BRITISH COLUMBIA.

The Bobbie Buens.—*Golden Era*, Jnly 29: Mr. John E. Askwith, who has for such a long time been known es the owner of the Bobbie Bnrns gold mine, McMnrdo hasin, East Kootenay, has returned this week from the coest, where he has snceeeded in forming a syndicate, composed of some of the leading mining men in Victoria, with a capital of $300,000. The nsnal legal formalities have to he gone through, after which active operatione will take place on the mill which is now in position on the mine.

OREGON.

Progeess at Ashland.—*Tidings*, Aug. 4: The new 600-foot tnnnel at the Ashlaud mine is still going through the tonghest kind of rock, but it moves abead at the rate of five feet a day with the aid of the Burleigh drill. . . Work at the Stonewall mine is progressing well. A tunnel is being driven in along the ledge to strike the deep prospect ehaft at a 150-foot level. It will be 360 feet long and is 170 now. A railway was laid this week in the tunnel to facilitate the work. Some fine pay ore has been taken out during the past week. . . Jas. E. Smith, who was in town thie week from the Pierson mine on the Klamath river, saye they expect to have their quartz-mill running within 30 days. It is the Jacobs mill of five stamps, which had beeu run as a custom mill near Henley. It has been moved and is being put up at its new site, where power to run it will bs furnished by a current-whesl in the Klamath river.

IDAHO.

Wabdner Deseeted.—Foothill (Cal.) *Tidings*, Aug. 3: The town of Wardner, Idaho, one of the principel mining towns of the Northwest, is practically deserted. Angus McKay, who arrived from there last evening, accompanied hy his wife, states thet on account of the low prics of silver all the mines have closed down and there is very little work of any sort of any one. Business houses are closed end the shutters nailed up, and owners of residences are willing to let them free of rentel to any one who will occupy them. "Ws bave," seid Mr. McKay, "one of the lergest ore bodies in the world, and if there is any legislation whatever in behalf of silver the mines will be reopened, but at its present low value the mining of silver ie very unprofitable, as it is regarded merely as a commodity instead of a precious metal."

NEW MEXICO.

Woek at Cook's Peak.—*Southwest Sentinel*, Anguet 1: There is little work now being done et Cook's Peak hut there ere very few men employed there. Shipmente of ore will not he worth mentioning until there is some improvement in the price of both silver and lead.

The Westeen Belle.—William Walker has leesed the Western Belle, also known es the Pattersou mine, at Gold Hill, and the Standard mill at that place. This is believed to be one of the best mines in the district and es promising es any in this section.

At Silver Ceeek.—With the exception of closing down of operations on the Confidence property at Silver Creek there is little change in the situation there. The outpnt of the camp remains about the eame and work on other properties continnes withont interruption. It is hoped that operations on the Confidence mill will be resnmed in the near future.

The Alhambea.—The Alhambra mine, at Black Hawk, is now reported to be in better shape than it has ever been before. Rich ore is in eight in the ehaft and in one of the drifts there is quite a body of high-grede ore. There has been a great deal of development work done in the mine dnring the past two years and in that time there has been considerable high-grade ore taken ont of the mine.

Watee foe Pinoe Altos.—*Southwest Sentinel*, August 1: It is reported thet the Manhattan Gold Mining and Milliug Compeny and the Pacific Gold Company have decided to pipe water to the mines at Pinoe Altos from a point above Fort Bayard, but nothing definite cen be ascertained in regerd to it. The mills could be operated at Pinos Altos as cheap as they can be operated here and all of the expense of transporting the ore would be saved. This amounte to $1.60 per ton, end as the mille eech bave a capacity of more than 50 tons of ore daily, the saving wonld be more than $160 a day. At this rate it would not take long to pay the entire cost of installing the water plant and removing the mills. It is hoped that the Montana tnnnel, which is now being driven by the Manhattan Gold Mining and Milling Company at Pinoe Altos, will be finished this month. It is being driven at about the rate of a foot a day and the manager thinks that it cannot be more than 30 feet from the end of the tnnnel to tbe vein. There has been no increase in the flow of water from the tunnel for some time.

WASHINGTON.

New Placee Mine.—A Tacoma special, Aug. 6, says: Miners Roper and Boys, of thie city, retnrned to-day and report a rich and newly-discovered plecer gold mine one mile from the mouth of the Americen river and about 40 miles from Ellensbnrg. Bill Tibb took a party of two Tacomans and one Seattleite into the district a short time ago. Roper and Boys say in one day one member of that party penned out nearly an onnce of gold, valued at $19. They brought a sample here which contains over 40 good-sized colors to about half a teaspoonful of black sand. Roper and Boys will retnrn as eoon as they get some supplies. They predict that there will be 200 or 300 miners in that country inside of a month. Roper and Boye filed on claims and posted notices, as those who had preceded them. Bill Tibb has been made cook for the camp, they sey, and besides doing the cooking pans out $2 to $3 worth of gold daily.

Quaetz Discoveey.—Toledo speciel, Aug. 4: Considerable excitement prevails here regarding the specimens of gold-bearing quartz brongbt from Green River mining district, in southern Lewis conuty. A prospecting party came in this evening and reports hundreds of men, some doing development on prospect holes, some tramping through the wooded foothills in search of gold-bearing quartz, which they would not know if they saw it, and others returning from the Green River district, eome of whom have discovered what promise to he valnable leeds.

Placees on Uppee Columbia.—Kettle Falle *Pioneer*: For over 100 miles south of the British line exist, at intervals of every few miles, deposits of gravel forming the river banks. These bars are generally quite large, containing all the way from 100 to 500 acres, and will average from 20 to 100 feet above high-water mark. These bars in the lest year have all been located and well prospected, the results being far greeter than was ever supposed to exist in large river banks. Hundreds of tests have been made in varions ways, from the gold-pan to the fine gold-saving machine, and the most reckless of tests with the gold-pan, where at leest a portion of the fine gold is sure to be lost, has given returns never less then 50 cents per yard, while the tests by both machine end fire run from $2.60 to $4.95 per yard.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 10, 1893.

Silver has taken a decided turn for the better during the week, the improvement being notable both at London and at New York.

One feature in connection with the reception of the President's message Tuesday in New York was the increase in the price of silver, which was quoted after the message was published at 74 bid and offered at 75¼. Brokers recalled the fact that on June 30th, when President Cleveland issued the call for an extra session of Congress silver sold at 67 to 69 bid and asked, but soon that market was exceedingly dull, almost as dull as before the receipt of the message.

Sub-Treasury Report.

J. P. Jackson, Assistant United States Treasurer at San Francisco, reports cash on hand July 31, 1893, as follows:

United States notes	$90,444 00
Treasury notes, 1890	21,025 00
National Bank notes	11,645 00
Gold certificates	6,320 00
Silver certificates	293,175 00
Gold coin	22,175,795 50
Standard silver dollars	24,194,237 00
Subsidiary silver coin	3,608,300 90
Minor coin	19 210 33
Total	$50,420,152 73

Quicksilver Trade.

The receipts of quicksilver at this port have been as follows:

Months.	1893.	1892.
January	2,243	1,701
February	2,388	1,543
March	1,588	1,875
April	1,623	1,901
May	2,511	1,598
June	2,790	1,614
July	2,014	1,632
Seven months	15,157	11,864

Against 7866 for the first seven months of 1891; 7013 in 1890; and 9487 in 1889.

The exports of quicksilver from San Francisco by sea in July, 1893, were as follows:

To—	Flasks.	Value.
Mexico	169	$ 7,079
Australia	50	2,075
Central America	112	4,604
New York	750	30,000
Totals	1,081	$ 43,758
January	3,208	129,360
February	1,235	49,579
March	1,859	74,269
April	1,073	45,084
May	646	28,345
June	1,228	51,357
Seven months	10,330	$421,752
Same time in 1892	5,546	230,372
Increase, 1893	4,784	$191,380

The total for the first seven months of 1891 was 2469 flasks, valued at $109,711.

The exports in the past seven months were distributed as follows: 6450 flasks to New York; 2603 to Mexico; 650 to Australia; 274 to Central America; 67 to New Zealand; 6 to British Columbia; and 280 to Prescott, Ont.

For some the Rothschild's price in London was £6 17s 6d per bottle (flask), and the local prices for home consumption were held at $43@43.50, as to quantity. On July 21st there were offerings from second hands in London at £6 12s 5d, and down to £6 9s on the 31st. On August 1st the Rothschilds came down to £6 5s, and to meet this cut the local market was lowered to $40@40.50, or a reduction of $3 per flask on previous quotations.

Wednesday	34½	75	9 85	3 25	18 45

Mining Share Market.

There has been some slight advance in Comstock prices this week and the market has been stronger and more active than for sometime past. The proposed curtailment of expenses at the mines may have something to do with streogthening the market, for it is thought that if the mines were managed less extravagantly they could pay their own way and assessments would be fewer. Messrs. Zadig & Edwards returned from Virginia City on Wednesday and report that the project to reduce expenses along the lode is meeting with considerable encouragement. Already has the water company made a reduction in its charges, the railroad company has promised to reduce its rates and the Miners' Union is understood to be considering the matter of compromising on $3.50 per day. The plan to close down either the Savage or Norcross shaft has not been definitely settled as yet, and the Virginia *Chronicle* has the following in relation to the matter:

"Charles H. Fish and Herman Zadig, directors of the Savage Mining Company, and John W. Twiggs and Colonel William Edwards, directors of the Hale & Norcross, arrived Saturday night from San Francisco. The object of their visit to the Comstock is to ascertain whether it is advisable to shut down either the Savage or the Hale & Norcross shaft and to work both mines, which are adjoining, through one of these outlets. The gentlemen, since their arrival, have visited the underground workings of both mines, but no conclusion has yet been arrived at in regard to the matter. Repairs to the Hale & Norcross shaft have been completed and eight of the men heretofore employed in repairing the shaft and two from the underground force have been laid off. There are still a few left."

The Eureka Consolidated Drift Mining Company has made application to be listed at the San Francisco Stock and Exchange Board, and sent along its check for $100 lor the annual dues. This is the second gold-mining company to avail itself of the hoard. Some others are said to be considering the proposition. The South Idaho Mining Company, of Grass Valley, has also made application for listing its stock at the San Francisco Stock and Exchange Board.

The Dayton *Times* says seven more men were laid off in Sutro tunnel on the first of the month. This leaves only five men at work now in the tunnel.

The Morgan mill at Empire is running on Cal. Va. ore, and the Mexican will start up soon.

The Comstock pay-roll for the montb of July amounted to $78,252.76, which is $18,508 less tban was paid out for the month of June.

The following mining companies report having bad balances on hand August 1, 1893, with the July expenses at the mines unpaid: Andes, $10,-128.41; Alpha Con., $6458.02; Alta, $14,035.73; Best & Belcher, $12,567.03; Bullion, $17,517; Bodie, $6425.31; Caledonia. $8607.27; Challenge Con., $1420.99; Con. New York, $3607.94; Crown Point, $2492.13; Con. Cal. & Va.. $45,278.95 in cash here and $16,828.81 in the hands of the superintendent at Virginia City; Con. Imperial, $1717.62; Crocker, $512.77; Exchequer, $960.61; Gnuld & Curry, $11,-345.71; Hale & Nurcnss, $3446.91; Independence, $41.55; Mexican, $2515.89; Mono, $5475.06; Navajo, $238.65; Nevada Queen, $30.42; Ophir, $1595.86; Peer, $126.76; Peerless, $1021.14; Savage, $11,-071.09; Seg. Belcher, $17.75; Silver Hill, $243.59; Standard Con., $26 771.20; Sierra Nevada, $6691.32; Scorpion, $1361.37; Union Con., $10,200.96; Utah Con., $597.10; Weldon, $280.49.

The following mining companies report having had an indebtedness August 1, 1893, with the July expenses unpaid: Belle Isle, $3693.14; Bulwer Con., $3530.81; Belcher, $11,692.19; Chollar, $2061.26; Confidence, $2370.06; Commonwealth, $26,946.83; Del Monte, $24,997.75; Grand Prize, $719.90; Kentuck Con., $8706.01; North Belle Isle, $8175.35; North Commonwealth, $453.61; Occidental Con., $3320.83; Overman, $886.21; Potosi, $34,077.87, with huilion to be received and an assessment being collected; Silver King, $7840.90.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

The following brief list by telegraph, lor August 8th, will appear more complete on receipt of mail advices:

California—Frank W. Swigart, Arroyo Grande, buckle; Byron Jackson, San Francisco, traction engine; Henry P. Holland, San Francisco, rotary engine; Murray H. Durst, Wheatland, magazine gun; Gustav H. Schultze, Berkeley, coin-controlling apparatus; Louis Hardt, Yuba City, plane; George E. Evans, San Francisco, amalgamator of precious metals; Leonard E. Clawson. San Francisco, chimney; James W. Atkinson, San Jose, incuhator and brooder; William Cameron, Milpitas, hydraulic pump; Orein Burns, San Francisco, hrake for bicycles; Luther H. Buchanan, Pasadena, electric arc lamp; Robert M. Wren and A. J. Oliver, Oakland, cloih-measuring machine; Wm. B. Pleas, San Francisco, dredging machine; Joseph N. and H. J. Harrison, San Francisco, electrode for firing explosives; William Forsyth, Fresno, paper box; Francis M. Speect, San Francisco, pipe machine for making spiral wire springs; Charles W. Tremain, Portland, stamp.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIO PREEE U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUE FOR REDUOINO BITUMINOUS ROCK. Edwin R. Thomason, S. F. No. 502,211. Dated July 25, 1893. The improvemente covered by this patent especially relate to an apparatne patented by the same inventor Feb. 28, 1893. The apparatue is of that class for redncing, to a plastic or softened condition, bituminone rock and other asphaltnm compounds, in which a rotating vessel ie employed and in which it ie enbjected to the necessary heat to reduce it. The improvements iuclude a novel, automatically and periodically operating feed hopper, a novel, antomatically operating receiving door for the reducing vessel and a gate or ebnter for cntting off communication between the reducing vessel and an underlying discharge chamber, thereby preventiug the entrance of cold air to the vessel when the discharge chamber is temporarily opened to withdraw the reduced material.

MECHANICAL CALCULATING DEVICE —David L. Albert, Fort Bragg, Mendocino Co. No. 502,217. Dated July 25, 1893. Tbis device for mechanically calcnlating ie especially adapted to figuring the contents of lumber or the wages of men for partial periode where they are paid by the month or other term. It may aleo be nsed for other pnrposee. With thie device it is possible to calcnlate the wages of a large nnmber of men working at different rates and for different nnmbere of daye with great accuracy. It ie also especially usefnl for lumber tallying where tbe lumber ie heiug loaded into or diecharged from a vessel or car aud in which varietiee of eizes of lnmber are being handled, and it ineures great accnracy in the tallying.

NIPPLE HOLDER.—Josepb Canney, Butte City, Mont. No. 502,224. Dated July 25, 1893. The inventiou relatee to the general class of screw-thread cutting appliances, aud particularly to the eub-class of holders for retaining the work being operated npon. The object of the invention ie to provide a simple and effective holder for close nipples upon which right and left tbreads are to be cnt.

AUTOMATIO WEIOHINO ANN RECORNINO SCALE. Walter F. Burne, S. F. No. 502,222. Dated July 25, 1893. Tbis ie a weigbing apparatne whicb is also adapted to record weights and to deliver one card containing the record and retain the other ae a check. The retained check is delivered into a locked receptacle, where it ie kept until removed by the proper officer.

PLANT OR TREE PROTECTOR.—B. F. Gilman, S. F. No. 502,559. Dated Aug. 1, 1893. Thie consiste of a pecnliar cylindrical casing adapted to surrond a yonng plant or tree. It is made of the pithy reed known as the tnle, the reeds being stitched together in eheets and then being brought into a circle. The interstiece between the reede allow a free circnlation of air abont the plant, but it is protected from the snn and cold winds.

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition of R. M. Moore and J. O. Boyd for permission to mine by the hydraulic process at the Kelly Hill Gold Gravel Mining property, situated in Butte County, in sections 27 and 28, Township 23, N., Range 3, East, and to deposit tailings in Neshit and Brewer Gulches, which discharge into Big Butte Creek, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on August 29, 1893, at 1:30, P. M. On and before this hour and day all parties interested may file affidavits, plans and maps, in support of their respective claims. By order of the Commission; W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with powar and economy in epace. It can bs run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. Ne licensed engineer at a high salary needed to operate it.

Send lor circulars and prices il a good safe engine is what you need.

The Oriental Launch is Perfection.

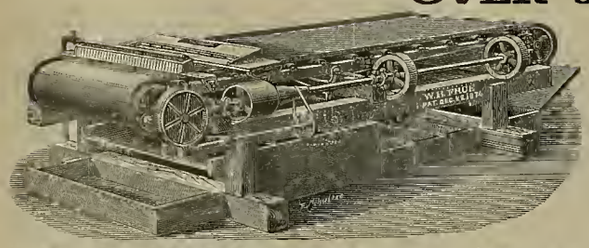
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small tomention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner.....$550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.

Centrifugal Roller Quartz Mill.

THE McGLEW ORE CONCENTRATOR COMPANY.

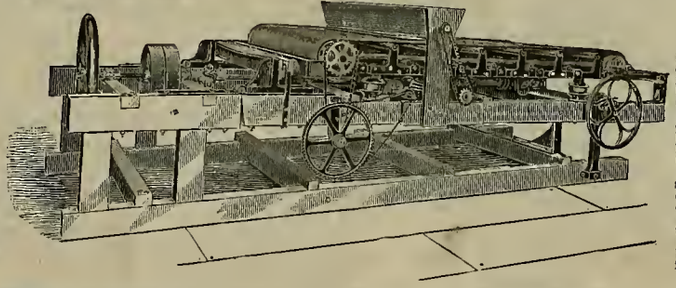
{PATENTED May 5th, 1893.} **CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE.** {FRANK BARRERE, Secretary.}

CAN BE SEEN IN OPERATION AT THE COMPANY'S WORKS.....132 MAIN STREET, SAN FRANCISCO, CAL.

NINETY-FOUR AND ONE-HALF PER CENT
——SAVED——
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, Ioo, SHASTA Co., CAL., May 25th, 1893.

MR. THOS. McGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

A Hydraulic Mine.

The prospect of renewed operations in hydraulic mining in the State makes the accompanying illustration of special interest. It is typical of large numbers of mines in California, some active, others idle, and the picture is so complete that it is almost unnecessary to describe the process. Hydraulic mining is officially described in the California code as "mining by means of the application of water under pressure through a nozzle against a natural bank." In other words the gravel is washed down from the bank and the gold taken therefrom by process of sluicing. Cuts are made in the bedrock, and the gravel is washed through them, the gold being retained in the sluices, and the debris passing on to a dump in the river or canyon or other depository. Twenty-five hundred inches of water is used in the Nevada county mine shown in the illustration. The monitors are nine inches at the nozzle.

A CALIFORNIA HYDRAULIC MINE.

There is an ancient channel, called the "dead blue river," which extends from Downieville, in Sierra county, almost due south through the counties of Nevada, Placer and El Dorado, a distance of 60 miles. The gravel is blue in color, and is overlaid by volcanic matter. Upon this channel are located the richest drift and hydraulic mines of the State. Its elevation at Downieville is 5000 feet, and at Placerville 2800 feet above the sea, and may be traced through Eureka, Quaker Hill, Dutch Flat, Gold Run, Georgetown and Placerville. Mr. John H. Hammond, a mining engineer, estimates that this channel has yielded $3,000,000 for every mile of gravel. Mr. John S. Hittell estimates that $250,000,000 has been extracted.

The other channels are more or less broken up and are not continuously connected. One begins at the northeast part of Shasta county, and thence runs southwest through Shasta into Trinity and across Humboldt county, and ends at the ocean at Gold Bluff. In Siskiyou county, along and adjoining Klamath river and its tributaries, are over one hundred hydraulic claims.

The so-called dead Stanislaus channel runs for 20 miles parallel with the present Stanislaus river. Upon this channel is situated the famous Table Mountain. Other systems are found in Yuba, Plumas, Butte, Amador, Calaveras and Tuolumne counties. Scientific opinion is divided whether these channels are ancient rivers; the popular opinion is that they are. At any rate, they are well enough defined to warrant the expenditure of capital in their development. The elevations of the bedrock are so well known, and the geological structure of the country has been so well studied, that little risk is taken in exploiting them. The general theory of these auriferous channel deposits is that they lie on the bedrock of old, buried rivers, contain some gold throughout, but are by far the richest on the country rock at the bottom, and are covered from nothing up to 1500 feet deep with volcanic ashes, tufa, lava and mud from eruptive agencies active after the gold-bearing gravel deposits were formed.

THE quarters of the Mechanics' Institute library on Post street have become too small, and for some time the directors have been considering the advisability of putting up a new building. Recently a committee was appointed to report on this subject. This committee, consisting of George Cumming, Marsden Manson, George E. Dow, Oscar Lewis and A. W. Scott, is now considering the advisability of erecting a building on the Hayes-street side of the Mechanics' pavilion, on the site now occupied by several frame structures. The strip of ground is 75 feet by 412, extending along Hayes street from Polk to Larkin. On this strip of ground the committee proposes to erect a four or five-story building, the top floors to be designed for the reception of the library and for necessary offices and lecture halls. The ground floor is to be cut up into stores and the floors above not occupied by the institute are to be devoted to offices. E. R. Swain has been employed as advisory architect, and he has already made several sketches for the consideration of the committee. Nothing has yet been decided upon, however.

THE VEXED QUESTION of wages has been settled at the Nanaimo and New Wellington, B. C., coal mines by a reduction of twenty per cent at the former and ten per cent at the latter. The reduction is for three months. The miners have averaged daily from $2.50 to $5.50 besides getting coal for use free.

A Promising District.

J. V. Keeley, formerly of Pioche, Nev., is in San Francisco in the interest of mines in Yellow Pine district, Lincoln county, Nevada. If the old Nevada theory still holds good that a mining camp is no account unless it is hard to get at, then Yellow Pine is possessed of claims to distinction, for it is very difficult of access. At present the nearest way is by rail from San Francisco to Blake's station on the A. & P. road, in San Bernardino county, thence to Vanderbilt 35 miles, and northeast 55 miles further to Yellow Pine.

The Nevada Southern railroad, a Denver corporation, is building through the district and extending northward. Mr. Keeley finds Colorado men more disposed to develop that country than are residents of San Francisco. So far, Denver capital has been solely invested to the exclusion of San Francisco capitalists, though every dictate of business suggests that to this city the output should come.

The country rock is mostly lime, badly broken up and bidding defiance to the theories of formationists, porphyry dikes intervening in every direction. The ore, chiefly red oxide, from the Keystone, Olementina and other mines, averages an assay of $325 in gold. The former mine has shipped seventy tons to Denver with very satisfactory results. On this trip Mr Keeley brought fifty tons to San Francisco at an expense of $80 per ton. The returns were fully up to the average.

So far nothing but free milling ore has been touched, but the whole country is full of base ore enough to run half a dozen smelters for an indefinite period.

The climate is something awful. Nothing but sharp, shining sand and brilliant sunshine, the thermometer ranging from 90 degrees to 120, water four cents a gallon and everything to eat, drink or use packed fifty miles through sand hub deep, make an undesirable combination.

But the gold is there, and lots of it, and with due encouragement on the part of capital Yellow Pine district will bring back to Lincoln county the old-time prestige of the days when the Ely district was pouring hundreds of thousands of dollars monthly dividends into this city.

RICH DEPOSITS OF ASPHALTUM are said to have been discovered on the Uintah reservation in Utah. A syndicate, headed by Adolph Busch, the St. Louis brewer, has been organized to get possession of the asphaltum deposits. It is necessary first to open the reservation to settlement.

An Era of Retrenchment.

It was once said by a prominent resident of Nevada that he didn't care what happened so it didn't happen to him. Several in Nevada and California are now saying the same thing regarding the proposed reduction of wages on the Comstock. All see that retrenchment is necessary, but whether it shall be manifested mostly in cutting down miners' wages or official salaries is the point at issue. Custom, tradition and precedent have had a good deal to do with the matter. It is not so very many years ago that, addressing a crowd of excited miners from the balcony of the International hotel in Virginia, Nevada, Wm. Sharon assured his auditors that he didn't propose to aid in the efforts then being made to reduce the wages to three dollars a day. "Why," said he, "it's all the same whether I pay you four dollars a day, or six dollars. I'll get it all back anyhow."

Those were the days when the men who worked in the breast of the drift were the heaviest outside buyers of stock, and who were depended on to give tips to friends on the outside when to come in and when to stay out. What Sharon said was then half joke and whole earnest; he and his confreres did get back considerable of what was paid in a good many ways, but the time has gone by when the men who carry their dinner-pails bought stock and sat in to the old game of freeze-out assessments.

Times change, and people now on earth must change with them. So far as the assessment business is concerned, it is inevitable that must change, too, for even a holder of Comstock shares will in time tire of carrying his cherished holdings.

With considerable strength of argument, the men employed on the Comstock point to the salary list and claim that among the officials is the place to cut down. They cite the Andes mine, which last June had two miners employed. During June the Andes paid a superintendent $300, an assistant-secretary $100, a secretary $250, a president $250, rent of office $100. This does look somewhat top-heavy, and the fact that such anomaly exists gives great reason to the claim of the men who do the manual labor, that in the offices is the place to begin the necessary work of retrenchment. During that one month of June the expense account of the Comstock aggregated $195,000. Less than twenty-five per cent of this—$44,000—was paid to men engaged in the actual work of mining. The other seventy-five per cent went for other expenses. It cost for the month $5800 to superintend the mines, $6230 for secretaries and assistant secretaries, $4650 for presidential services, and so on.

This is an era of retrenchment, and while the laborer is worthy of his hire, all concerned must bear in mind that the business won't stand the present prices paid employes in every department of work on the Comstock and elsewhere.

Hydraulicking Under the Law.

It is probable that the first hydraulic mine to be operated under the Caminetti law will be the Kelly Hill Gold Gravel Mining property in Butte county, at Big Butte creek, about seventeen miles from Chico. Mention of the application of Messrs. J. C. Boyd and R. M. Mooer, the owners, was made last week. The deposit is very rich and is so located that tailings may be deposited in either of two gulches. Restraining works will probably never be needed, but, if they are, there are ample facilities for their erection. Some drift work and ground sluicing have already been done, and something like $170,000 taken from the gravel, which has so far averaged $3.50 to the cubic yard. Five hundred inches of water are to be used, and it will be obtained from the Cherokee Mining Company. Two giants will be put in. The fall of the water is about 1100 feet, its present distance about 3½ miles. Messrs. Mooer and Boyd are sure they will get considerable gold from the gravel, and they do not complain particularly of the hardship of the Caminetti law, or of the three per cent required to be paid to the Government, although, as a matter of fact, their location is such that their mine could have been operated without interference at any time in the past. But they prefer to settle all legal questions now and go on without possibility of interruption in the future.

The example of these gentlemen might well be emulated by many others. It is true that times are hard and the law is not satisfactory. But a half-loaf is better than no bread. The chance of securing more favorable enactment is not first-class, and effort in that direction is, we think, not now contemplated. Some hydraulic miners say they prefer to leave their gravel beds wholly untouched rather than to exhaust the deposits, dissipate one-half of their profits (more or less) in construction of restraining works, in paying the Government's three per cent, and other expenses made necessary by present legal requirements. Their view is believed to be erroneous and likely to injure their own interests. A mine paying $1000 per month for a series of years is not as desirable a property as a mine paying $2000 for the same period, but it is $12,000 per year better than nothing and $12,000 more lucrative than an idle mine is, or, in our judgment, will be, if the owner awaits the time when the anti-debris influences are all dead and the industry is completely unshackled. Hydraulic mining in California has for a number of years been under a very dark cloud, but the sky is clearing and an avenue is opened up for renewal of operations under circumstances that will allow a modified degree of its former vigor and importance.

Congress and Silver.

Congress has addressed itself in earnest to the task of remodeling the coinage laws, and measures designed to relieve the prevailing financial disorder have been presented in large number. The main silver question has so far occupied the exclusive attention of the House, but the Senate is considering collateral matters, such as the national banking laws, the increase of currency, etc, etc. Its policy is to wait until the House has disposed of the Sherman law, and then continue the discussion begun by the lower body.

Whatever may have been the situation at the beginning of the special session, it is unquestionable that the silver men have gained both strength and confidence since the delivery of the President's message, declaring oracularly for a gold standard, offering no sort of compromise to silver men or bimetallists and suggesting or promising nothing beyond the unconditional repeal of the Sherman law. The President's message was a serious mistake. It has done much damage to his own cause. It was too clearly the embodiment of the puritan sentiment which has attempted and has partly succeeded in making silver the scapegoat of all the financial evils under which the United States is now laboring. Further, the universal encomiums the message has received in England and in the extreme East have not had the effect of strengthening the President's hands. The silver men in the House continue to be the aggressive element in debate, and are making a hard and determined fight.

The general opinion is that the Wilson bill for unconditional repeal will pass the House and that it will be defeated in the Senate. If, however, the administration is strong enough to force the bill through the upper body, Mr. Cleveland will quickly sign it and be in position to dictate subsequent legislation. When the bill passes the House, the policy of the silver men in the Senate will be to load it down with amendments, and their plan of campaign has a good chance of success. The amended bill, when through the Senate, will be returned to the House, where the fight will be on again. If a compromise is reached and sent to the President, it will likely encounter his veto. The whole question seems likely to resolve itself into a situation with the Senate on one side and the House and President on the other. There may be a deadlock. Everything depends on the Senate.

The silver men have no reason to despair. The President has inadvertently handed to them the cool end of the poker.

Shows His Faith by His Works.

Ex-State Senator Cross of Nevada county, one of the framers of the Caminetti bill, will demonstrate his faith in the practicability of the measure by operating a hydraulic mine at Brandy City, Sierra county. The mine had been shut down, having been enjoined from work, but now the Senator proposes to have surveys made, to the end that he may apply to the Debris Commission for license to mine. Mr. Cross thinks two-thirds of the hydraulic mines of the State may be worked under the law, after proper restraining works have been erected. He adds:

"The dams will cost considerable money and will consume a large amount of the profits of the mine, but in the end the country will be benefited, for the money that otherwise would have gone into the pockets of the miners will be paid out for material and labor. The Caminetti bill, I firmly believe, will result in a solution of the hydraulic-mining question.

"I venture to say," continues Mr. Cross, "that had the hydraulic miners been allowed to operate the past ten years, the United States wouldn't be disturbed as it is and that the silver question wouldn't present the phase it does now, for in the past ten years the mines would have produced $100,000,000 of gold. I estimate that for every dollar of this gold three dollars of silver would have been spent. The production of this vast amount of gold would have necessitated the coinage of plenty of silver, and the result all around would have made the financial condition of this country very much healthier than now, and, in addition, the circulation of money would have been freer."

Although the ex-Senator's views on the financial phase of the matter are, from the nature of things, merely suppositious, there can be no question that the volume of wealth of the country has been much restricted by the idleness of the hydraulic mines. But the mines are still there and most of them can be worked. Capital for repair and operation will be easier to secure after awhile than it is now. It seems certain that hydraulic mining in California will after awhile assume something like its old-time dimensions. The time to begin is now, wherever practicable. Gold is worth more than it ever was, for its purchasing power is greater than at any time in history.

Mr. Cross thinks the farmers will stand by the Caminetti law. As a class they doubtless will. But there are some professional grangers who will never allow themselves to learn that the hydraulic war has ended as long as they have a unit of lung power left.

A CORRESPONDENT of the Marysville *Appeal* preaches to the anti-debris people the necessity of keeping strapped down the "hydraulic giant," the creature of "non-resident and foreign corporations." Gulliver has awakened and he is breaking the threads of the Lilliputians. Though it is distinctly assured that the interests of the farmers along the Sacramento, Yuba, Feather and other rivers are to be protected, the Anti-Debris Association continues to howl just from pure habit of howling. It will not close its mouth long enough to allow itself to hear of the equities, necessities and honest intentions of the hydraulic miners. It considers the effort to resume mining an "unholy crusade," but it is not able to point out satisfactorily in what respect mining under the law is damaging or mischievous. The association knows, or it ought to know, that it has the right to appear before the Debris Commission and protest against the grant of every application for license under the Caminetti law. It knows, or it ought to know, that the law expressly provides for the rejection of every application wherein the interests of adverse parties are at all likely to suffer. The applicant must affirmatively show that his location is such that no damage will result to other properties. The way of the anti-debris people is clear, easy, effective and inexpensive. It does not come with good grace for an association representing much the smaller fraction of the total interests involved to declare that under no circumstances shall the greater be allowed to escape from the complete control of the less.

THE CELEBRATED Last Chance-Tyler mining case has reached the Federal Court of Appeals in this city, having been brought from Idaho. The Tyler mine in Shoshone county has one of the richest silver ledges in the State. The dip is 40 degrees. Several mining claims were located adjoining the Tyler mine, with the idea of tapping the ledge. The Last Chance mine succeeded in effecting its purpose, extracting, it is alleged, $200,000 worth of ore. Suit was brought by the Tyler people. Judge Beatty gave judgment in that amount to the Tyler mine in the United States Circuit Court for the Idaho district on March 6, 1893. The case was then carried to the United States Court of Appeals, in which it is now being considered.

Important Decision in a Mining Case.

An interesting and important decision has just been rendered by Judge Davis of the Superior Court of Amador county, in the case of the Keystone Consolidated Mining Company vs. the South Spring Hill Mining Company. The Keystone company alleges in its complaint that the South Spring Hill company is working on its ground beneath the surface, and asks for an injunction, damages and an order that it be allowed to inspect the defendant's mine so as to ascertain the amount of damage done.

In granting the order allowing survey and inspection of the underground workings of the South Spring Hill mine, Judge Davis reviews at length the English chancery cases hearing upon the question and the few American cases. The following is an extract from the decision:

"Ought a court of equity, in a mining case, when it has been convinced of the importance thereof, for the purposes of the trial, to compel an inspection and survey of the works of the parties and admittance thereto by means of the appliances in use at the mine? All the analogies of equity jurisprudence favor the affirmative of this proposition. The very great powers with which a court of chancery is clothed were given it to enable it to carry out the administration of nicer and more perfect justice than is attainable in a court of law.

"That a court of equity, having jurisdiction of the subject-matter of the action, has the power to enforce an order of this kind will not be denied. And the propriety of exercising that power would seem to be clear, indeed, in a case where without it the trial would be a silly farce. Take, as an illustration, the case at bar. It is notorious that the facts by which this controversy must be determined cannot be discovered except by inspection of the works in the possession of the defendant, accessible only by means of a deep shaft and machinery operated by it. It would be a denial of justice, and utterly subversive of the objects for which courts were created, for them to refuse to exert their power for the elucidation of the very truth—the issue between the parties. Can a court justly decide a cause without knowing the facts? And can it refuse to learn the facts? But one adjudication of this subject can be found in the books and this is in conformity with the views here expressed, viz., Bainbridge on Mines.

"Of course, before granting an order of this kind the court must be satisfied that the application is made in good faith, and in granting it will pay due regard to the convenience of the party affected."

The order for a survey was thereupon granted as prayed for in the petition; with, however, certain important limitations as to the amount of rock in each sample, the limits of the mine to be surveyed, the number of persons to be engaged and the time to be occupied in the survey, to the end that there might be no serious inconvenience or hardship upon the defendant corporation.

Mr. Hallidie at the Chicago Fair.

Mr. A. S. Hallidie, the well-known inventor and manufacturer of this city, has been making a visit to the World's Fair, and he furnishes to the *Bulletin* a very entertaining and instructive letter. He was in constant attendance at the great show for four weeks and he pursued his sight-seeing in so systematic a manner that he was able to "take in" all its important features. After having visited all the great modern expositions, at home and abroad, Mr. Hallidie unhesitatingly pronounces the Chicago fair the chief of all. Naturally, we might expect that the mechanical features of the great show would impress themselves particularly upon Mr. Hallidie, and we are not surprised to find him giving dimensions and distances. This is how he describes the immensity of the show:

"Of the 533 acres of ground occupied by the fair grounds proper, about 150 acres are under cover, one building—the Manufactures—alone covering 32 acres, or say a space equal to 11¾ blocks north of Market street, San Francisco, or 70½ 50-varas! The remaining 383 acres are laid out in excellent walks and drives, kept in good order and well-sprinkled, and with canals and basins, with pretty bridges, jetties and landings, the waters being enlivened with electric and steam launches and gondolas.

"The immensity of the exhibition is not at first realized, and it is only after walking from one building to another at the extremes of the grounds that one becomes aware of the great distances. For instance, from the Fisheries Building to the Agricultural Building Annex is over a mile; from the Government Building to the Administration Building is nearly three-fourths of a mile; from Fine Arts to Forestry is one mile and one-third."

The writer offers good advice about study of maps to familiarize oneself with the relative position of buildings and suggests a trip on the intramural (electric) road, which touches nearly all the main buildings. He continues:

"I took in the Manufactures and Liberal Arts Building first and did it rapidly. It occupied 3½ days of about 6 hours each. The longitudinal and transverse avenues on the main floor aggregate 6 miles and in the galleries 3¼ miles, or 9¼ miles in all. The small passages in and across the exhibits will probably aggregate 12 miles more. It will thus be seen that in 21 hours actual time about 21 miles was walked over, looking at and examining the articles on exhibition. In the Transportation building there are four miles of principal avenues on the main floor. The rapid inspection of this floor required two days, and so with the other buildings—Electricity, Machinery, Agriculture, Horticulture, Mining, etc. There are 13 principal buildings, including the Government Building, equal in number to the original States, while 41 States and 3 Territories and 17 foreign nations have buildings of their own on the grounds."

The trouble with the fair is that it is too big. There seldom appears to be a crowd. Exhibitors and commissioners are disappointed at the attendance, which is largely from towns within 200 or 300 miles of Chicago. Mr. Hallidie urges all who can possibly spare the time and money to see the fair and says:

"The facilities for getting from Chicago to the fair are excellent in every way—cable and electric cars, elevated and surface steam roads and steamboats carry all the passengers who offer. The Chicago City Cable Railway Co. collected nearly 500,000 fares on the Fourth of July, and on returning from the Auditorium on the evening of that day, on the elevated road, I met, in going from Congress street to Forty-eighth street, 20 trains, each train consisting of six cars, filled by 150 passengers each, or a total of 18,000. * * * * * *

"It is a pity with all this that the patronage is so small. It is not expected that such exhibitions will show a credit balance at the close. Of the finances of this great fair I gather from Auditor Ackerman's report to July, and from the admission from the opening to July 14th, the following results:

EXPENDITURES.

Construction expenditures	$16,229,905 74
Obligations under contracts	1,286,675 26
General and operating expenses	4,299,579 73
Preliminary organization	90,674 97
Accounts payable	710 553 46
Operating expenses from July 1st to October 26th	1,500,000 00
Interest on bonds, $4,444,500	444,450 00
Total expenditure to Oct. 26th	$24 561.839 16

RECEIPTS.

From city of Chicago	$5,000,000 00
From stockholders	5,589,067 60
From bonds	4,444,500 00
From souvenir coins	2,428,040 70
From interest	95,513 46
Miscellaneous items	437,027 57
Concessions to July 1st	580,006 36
Concessions to Oct. 26th, estimated	1,500,000 000
Gate receipts before May 1st	282,449 00
Estimated gate receipts during fair	7,900,000 00
Estimated salvage	500,000 00
Total receipts	$28,756,660 46
Total disbursements	24,561,839 16
Balance	$4,194,821 30

"Which will leave a deficit to pay bonds of $249,678.70 and prove a total loss to amounts advanced by the city of Chicago and the stockholders—$10,589,067.60 in addition. In the above calculation the average daily attendance is placed at 100,000 per day.

"This should not be, and it is unfortunate it is so. Instead of an average daily attendance of less than 80,000 up to this time, it was reasonable to expect, in view of the enormous outlay and efforts made to insure success, that the attendance would average certainly 150,000 daily, which would have made a difference of about $5,000,000 in the receipts for admissions and probably $1,000,000 in the receipts from concessions."

A WASHINGTON DISPATCH contains the information that Representative Caminetti has been trying to find out why an additional engineer is not appointed for the California Debris Commission, and he has learned that Assistant Secretary of War Grant does not look with favor upon the Commission nor the law under which it is working. It is interesting to learn from the dispatch that the assistant secretary wants to be convinced as to the merits of the law; but it would be a good deal more interesting to know why it is necessary to convince any officer of the wisdom of any statute before he can be prevailed upon to carry out its provisions. There is an old-fashioned notion in this part of the world that it is the duty of an executive officer to administer the law without inquiry as to its policy or efficiency, and to do it as speedily and thoroughly as practicable. But things occasionally happen that materially assist us to a contrary conclusion. The Mining Commission has a great deal of work to do, and it ought to be assisted in every reasonable manner by the authorities at Washington. The Caminetti law is by no means all the hydraulic miners wanted; but it seems to have been the very best they could get. Now, having manifested a disposition to accept its provisions, they have a right to expect that every facility will be afforded them. The Debris Commission is doing all it can, and will no doubt continue to work as rapidly as possible.

PEOPLE who have just returned from Kootenay say that the depression of silver materially tends to make silver-mining quiet. Development work is going ahead, but not to the extent that it would under other conditions.

Foundry Notes.

THE Germania Lead Works is adding to its plant two of the largest-sized Bruckner roasting cylinders. Each cylinder is 8½ feet diameter by 22 feet long, weighs 46,000 pounds, and has a capacity to each charge of about 12 tons. These cylinders were furnished by the Vulcan Iron Works of this city.

THE new triple screw cruiser Minneapolis was launched at the Cramps' shipyard, near Philadelphia, August 12th. She has the following dimensions: Length, 412 feet; beam, 58; draught, 24; displacement, 7475 tons. On the trial she must show a maximum speed of 22 knots and a continuous steaming speed of 21 knots.

THE cruiser Olympia is off the drydock and is being made ready for her trial trip, which takes place in about ten days. The engines and boilers are nearly ready for the preliminary tests. The eight-inch turrets are yet incomplete, awaiting the arrival of heavy steel tubes from the East. Two anchors, weighing 9000 pounds each, have arrived.

THE first consignment of armor plates for the monitor Monadnock has arrived at Mare Island Navy Yard from the Carnegie works. The consignment consists of six plates, three straight and three curved. Their aggregate weight is 41,000 pounds; the three larger ones weighing 11,000 pounds each. It is understood that there are several consignments in transit to the coast. These plates will be put in position as soon as possible and an effort will be made to hasten those en route.

THE Union Iron Works has completed the new steam-yacht El Primero for E. W. Hopkins. The official trial trip was made last Friday. She went over a two-mile course four times. The first time the screw was worked at 150 revolutions a minute, the second time at 200, the third time at 260, and the fourth and last time at 330. At that number she made a maximum speed of 16½ miles an hour, with an average of 15¾ miles an hour. This is three-quarters of a mile an hour faster than her contract calls for. The working of the engines when the yacht was pushed to 330 revolutions was something wonderful. There was no jarring, kicking or hitching, and not the least vibration.

Tailings.

THE W. Y. O. D. Mining Company, at Grass Valley, has declared a dividend of ten cents per share, making the fifteenth dividend thus far declared by the company. The mine is looking well, and there is every indication that more dividends will follow.

THE mines of the New Vancouver Coal Company at Nanaimo and New Wellington, British Columbia, employ the large number of 1480 men. Last year they produced something over 550,000 tons of coal, and in 20 days last June they produced 52,500 tons. A very large fleet of vessels is employed.

THE Pittsburg gold mine, near Battle Mountain, Nevada, has closed down, throwing about 30 men out of employment. The shutdown was caused by the scarcity of water, the mill being built on the mountain-side, where it is impossible to obtain enough water for milling purposes during the dry summer months.

THE stockholders of the Granite Hill Mining Company have elected the following directors: Willard Gardner, J. F Cooper, and Street Superintendent Green of Sacramento, and W. B. Van Orden and Wm. George of Grass Valley. The board organized by electing J. F. Cooper president and J. M. Wiley of Grass Valley secretary. S. B. Fowler was elected superintendent.

OPERATIONS in the Utah Consolidated at Virginia were suspended last week. Explorations in that mine have been in progress for the past 20 years, and during that time assessments have been levied on the property aggregating $420,000. Latterly only two men have been employed in underground work. The failure of the shareholders to pay the last assessment is the cause of the shutdown.

PROSPECTORS returning from the Hoodoo mines in the Coeur d'Alene mountains, 60 miles east of Colfax, Wash., bring a good deal of gold dust from the placers and a few nuggets. Experienced miners, who have been there, declare that before long the Hoodoo will be a fine producing camp. Several outfits from various parts of Palouse are preparing to go up on prospecting trips of a month or six weeks.

THE Morning Star mine of Iowa Hill is to the front again with another dividend, the amount being $2 per share, or $4800 in the aggregate. For the past two years the mine has averaged about $2 per share per month in dividends, making a total of about $120,000. At the present time extensive improvements are being made at the mine, which is good evidence that it is looking well and that more dividends may be looked for.

ARTICLES OF INCORPORATION have been filed in the office of the Secretary of State by the El Rey Mining Company of Sacramento. The capital stock is $1,000,000, being 100,000 shares of $10 each, and the amount already subscribed is $355,000. The directors are: C. J. McBride of Lincoln, and J. F. Fenton, M. J. Terry, S. Katzenstein and C. J. Atwater of Sacramento. The mine which the company intends to operate lies about eight miles from Auburn and fourteen miles from Shingle Springs.

THE McCrum Sampling and Milling Co. have started their machinery in Arizona at the old Silver Belt silver mine, four miles from the noted Bowers' ranch and the Agua Fria, 18 miles from Prescott and four miles from Big Bug. One hundred and fifty feet of trestle work connects the bins to the sampling room—an iron building 16x20 feet and 20 feet high. This contains the rock-breaker, Cornish rolls and the automatic sampler, the invention of the manager. The works have a Huntington mill of ten tons capacity, with power sufficient for two more of that size. They have two Frue vanners for concentrating, and will handle all kinds of ore. Also a 35-horse power engine with a 60-horse power boiler, and a 5x3x8 Hooker pump for use in case of fire. The works will use the Silver Belt mine as a reservoir for their water supply, its many drifts and stopes affording ample storage capacity.

Studies in Gold-Milling.

NUMBER II.

[Written for the MINING AND SCIENTIFIC PRESS by J. A. EDMAN.]

An examination of the products of amalgamation obtained in gold milling strongly impresses the observer with the evidence it presents of being mainly a chemical process or a combination in definite proportions between gold and quicksilver. Three varieties of amalgam have been noted by the writer, all referable in their crystallization to the Tsometric system, namely, the acicular, the prismatic and the octahedral amalgams, all to be found in most quartz-mills. The acicular amalgam appears as groups of slender and delicate, straight but tapering crystals, silver white and highly lustrous, and generally forms where the mercury is largely in excess, as in riffles, wells and traps, a low temperature as from 32° Fahr. to zero being most favorable to their development. At about 70° they become fluid and are generally very fragile. Deprived of their quicksilver by careful treatment with cold dilute nitric acid, they form beautiful objects for the microscope, their size ranging from 1-1000 to 1 inch in length. Percentage of gold not determined, but may be approximately stated as near 20 per cent.

The prismatic amalgam, which is the most abundant in gold mills, consists of short, prismatic crystals closely interwoven, seldom exceeding 1-16 inch in length, but generally microscopic. In cross-section the crystals are hexagonal but flattened. After treatment with acid and gentle ignition they show a bright but pale yellow gold color. The composition approximates 25 to 30 per cent of gold, this amalgam being more stable than the acicular and forming at ordinary temperatures, but becoming fluid in an excess of mercury at about 100°.

The octahedral amalgam occurs in small single or grouped crystals, generally in modified forms of the octahedron and cube, and contains a higher percentage of gold than the other forms, probably near 50 per cent. This amalgam forms slower than the others, and where the gold is in excess, or where the mercury acts upon larger grains of gold, and is the most stable of all the forms observed. It occurs frequently on placer gold, often covering entirely the surfaces of scale gold collected by amalgamation. After treatment with acid the gold from this amalgam shows a brownish-yellow color, which, upon ignition, changes to a bright reddish yellow, the crystals cracking in certain directions. The crystals are generally microscopic, varying in size from 1-100 to 1-15,000 inch. Traces of copper, probably derived from the plates, are found in most of these amalgams, but most frequently in the acicular. All the amalgams from gold mills so far examined contain crystals of the prismatic and octahedral forms, the first predominating. On the plates inside the batteries a large percentage of coarser grains of gold and rich sands are found imbedded in the soft amalgam by the forcible splash of the stamps, but even there, if allowed to remain in the batteries for some time, become permeated by the mercury and crystalline.

It is evident that time forms an element in all gold amalgamation, its progress depending upon the size of the gold particles. Very fine microscopic gold will enter in solution almost immediately and show crystals on the plates, and sizes up to one-fiftieth of an inch will be absorbed within 12 hours at ordinary temperatures. The largest portion of amalgam on aprons and plates is found crystalline through its mass except when running on rich ores, when the surface of amalgam shows imbedded grains of such sands, when the surface of gold exposed always greatly exceeds that of the quartz or rocky matter. In fact, where very fine gold occurs in an ore, scarcely any sand can be seen among the plate amalgam, and the whole presents a network of interwoven crystals. Amalgam from grinding-pans is generally perfectly crystalline; that from arrastres, while crystalline through its mass, exhibits coarse gold and sand, as here the amalgam becomes protected from grinding by lodging in the depressions of the bed.

These facts furnish evidence that of the gold passing through a stamp-mill or other crushing device, the larger grains easily settle to the bottom, a portion of larger grains and fine free gold attaches to the plates inside the battery, while scarcely any but the free purely metallic gold adheres to the plates below. It is doubtful if any grains of sand containing less than 50 per cent of gold ever become caught on the plates, while the bulk of rich sands continue on their course, as one writer (O'Driscoll in Notes on the Treatment of Gold Ores) quaintly expresses it, "to be carried off by the water into the tailings or down stream," past recovery by any except the cyanide process as applied to tailings.

The fears often expressed by writers on the metallurgy of gold, that the action of stamps tends to beat out the gold particles into thin flakes, appear from the testimony of the microscope to be entirely unfounded. The closest examination of amalgamation products fails to exhibit such action, except in the few instances where comparatively large gold particles have been observed flattened. This will further appear when referring to the grinding of ores.

Another amalgamation product common to mechanical operations in both gold and silver ores appears in the floured mercury of which so much has been written and so many speculations indulged in. Floured mercury must of necessity be produced in all operations where that metal is admitted to the crusher and the grinder, and without it there could be no efficient amalgamation. In fact, the particles of quicksilver should correspond to the size of the gold to give the best results. It is only when the flouring becomes excessive that a remedy should be looked for. Floured mercury consists of nearly spherical globules ranging in size from 1-100 to 1-5000 inch, seldom as low as 1-10,000 inch diameter, and under the microscope their surfaces appear coated with grains of mineral matter varying according to the ore and often containing fragments of pyrites and other sulphides, but in free-milling ores consisting mainly of grains of quartz and scales of talc. The globules almost invariably carry a nucleus of gold-bearing rock around which are crowded minuter fragments of mineral matter present in the ore. A globule 1-50 inch in diameter will often after treatment with acid develop over 100 particles of gold and rocky matter containing gold in still minuter forms, all the gold generally being crystalline or coated with crystals, the octahedral form predominating. Gold is always present in this form of mercury from a gold mill, ranging up to ten per cent, and averaging four per cent with low-grade ores. Above five per cent gold contents the globules become irregular in form, and at ten per cent quite pasty, in which condition they are often found about the batteries and head of aprons.

Floured mercury may be kept under water for an indefinite time, part of the globules becoming brown by oxidation, but when kept dry they gradually coalesce into a mass of mercury in which the gold exists mainly in solution, the mineral impurities forming a crust, often dense and black.

Independent of the action on mercury of the salts in solution in the pulp, and of the coating by mineral matter, some natural force relating to the spheroidal state of one fluid when immersed in another probably determines the main causes of repulsion between the globules, as when a number of them are lying in contact, and covered by water, will immediately begin to flow together when the water evaporates. Rich plate sands amalgamated enough to stick together in clusters will, if kept for two months in a dry and dust-free atmosphere, develop groups of beautiful prismatic crystals from every gold surface until all the mercury has united with the gold in a crystalline amalgam.

Whatever be the chemical causes that determine an excessive flouring of mercury, among which the presence of soluble proto-salts of iron appears most potent, an explanation thereof can also be found in the action of certain minerals which in a mechanical way prevent amalgamation particularly on plates. While clayey matter always is injurious by increasing the density of the pulp and enveloping the gold particles, talcose clays cause the most difficulties by their mechanical action on the pulp. They consist mostly of exceedingly minute and thin flakes of transparent talc with a little oxide of iron, and, diffused in the pulp, permeate it thoroughly. Being somewhat denser than quartz, the flakes sliding over the plates prevent their contact with the gold, while the upper stratum of the pulp contains them in a rolling motion. As talcose material is often found present in decomposed ores, even up to 50 per per cent, the loss of gold in such cases is large where battery and plate amalgamation alone is depended on. The recovery of the floured mercury must be sought by means of concentration, as a large percentage is easily saved both on belt concentrators and percussion tables.

Viewed from its best practice, the amalgamation of gold on plates is the crudest possible method of gold recovery, and the sooner it is relegated to tradition the better for the gold-mining industry. The ingenuity and money expended during the last 40 years on plates, riffles, wells, traps, stirrers and plate concentrators would, if applied in other directions, have gone far towards developing a rational system of amalgamation, and would have saved millions now practically wasted. Many of the smaller mines yet depend upon this class of amalgamation, and the writer is acquainted with one instance where a large quartz-mining district, running at one time 180 stamps, depended during many years on battery and plate amalgamation exclusively, and yet maintains the same practice on a smaller scale.

Under the conditions prevailing in battery and plate amalgamation, perfection could not be expected even if the character of the ore offered no obstacles, as enough time is not given for intimate contact between the gold and mercury in the rapid passage from the battery after being partially set free from its rocky matrix. Of the gold so freed a large percentage remains unaffected, and if of sufficient specific gravity will be saved on concentrators, otherwise becoming a waste product. Another portion, varying with different ores, refuses to be amalgamated under the conditions presented, mainly from the resistance offered by substances coating the gold surface in whole or in part. These, as shown by the microscope, appear to be: Fragments of pyrites and other sulphides adhering to the gold; thin coatings of oxides of iron on gold set free from decomposed pyrites, and of the oxides of lead, antimony and zinc from their sulphides. Oxides of manganese often form coatings, as also copper sulphides, especially copper glance. In some ores, mainly from veins in granite, a tenacious coating is found of an intimate mixture of oxide of iron (limonite) with wulfenite or anglesite.

The difficulty of amalgamating the free gold found in the ores of tellurides and selenides of gold and silver is well known, and this behavior with selenide ores has been fully confirmed by the writer's experience. The gold particles of all sizes appear clean and of a high gold color, but with a peculiar luster like that of lacquered brass. In one instance 90 per cent of this gold escaped amalgamation and showed scarcely a trace of mercury, and amalgamation was effected only by long-continued grinding under very smooth surfaces. All the tests made point to seleneous acid as forming this coating, a probable product from the oxidation of the selenium originally combined with the gold.

Condition of Cornish Mineral Industries.

Though subject to periodical fluctuations, Cornwall seems still able to maintain its fame as a leading metal-producing county, more especially in regard to tin. Time was when no other county in the United Kingdom could boast of being able to return copper in quantities equal to Cornwall, but for the last 25 years the product has gradually diminished in quantity, so that from a former annual value of about half a million, that obtained last year realized but £24,746 for 495¾ tons, and compared with the previous year even, a considerable decrease, seeing that the value of 719¾ tons realized £40,708, on an average of but £1 15s. 9d., against £1 19s. 2d. for the previous year, and the standard but £70 2s. 8d., against £76 10s. 6d. It is no wonder, therefore, that considerable attention is paid and large sums invested in the production and development of the kindred metal, tin. For many years vast sums have been expended in removing the primitive machinery of our forefathers and in substituting mining machinery of the latest and best type. This has enabled mining to be carried on at considerably greater depth than previously. As a natural consequence, the cost of producing the metal has risen considerably, but as a set-off the metal obtained is found to be of much greater value. Thus, in 1891, the quantity of tin raised and sold was 9353½ tons, which realized £881,139, whilst the 9251¾ tons brought to surface in 1892 realized for its owners £892,982.

The produce of other minerals is comparatively small in this county. For instance, lead, the accumulated gain for which has been but £105, and arsenic, 1086 tons for £1067, China-clay has yielded, and continues to yield, very well, in spite of all the difficulties and troubles recently arising from proposed amalgamations which did not prove successful. These works have produced no less than 408,492 tons, which, at the works, is valued at no less than £306,369. The whole of this was shipped with the small exception of 3581 tons, which made its way into the English centers.—Industries and Iron.

Mining in Central Placer County.

TO THE EDITOR:—The numerous quartz properties of central Placer county seem to be attracting more attention at the present time than for a number of years past. One familiar with the geology and minerals of this gold-producing section can only feel that they have been neglected or overlooked too long.

The adaptability of the climate and soil for early and citrus fruit-growing seems to have turned all enterprize and thought to their production and shipment for eastern and even foreign markets.

The little mining that has been done (some one has more appropriately than poetically termed it "grass-root mining"), when applied to quartz-mining, means no mining at all.

The late sale of the Three Stars mine and other properties in the Ophir district, to a Colorado company for a very large sum of money (in silver) promises the commencement of active and thorough mining in this section. A shaft is being sunk on Bald Hill, where a regular fissure vein is known to carry heavily mineralized quartz. Bald Hill district has so many fine-appearing quartz ledges, and it has always been so bewildering to miners, notwithstanding the fact that a great deal of gold has been taken out, that no extensive work has ever been prosecuted on any one vein.

Although quartz ledges are known to abound on either side of the slate and granite contact which extends north from Bald Hill into Nevada county, no prospecting of any significance has been done south of Wolf creek. Why, is more than any one can tell. A ledge over 23 feet wide has been sunk to the depth of 40 feet and is known to carry more than enough gold to pay for working. The owner, more interested in tilling the soil than mining, has never made any disposition of it. Such properties in the hands of practical and experienced mine managers would yield dividends on their working and inevitably add impetus and life to their surroundings.

Much is always said about every good-paying mine, especially when it has been a bullion-producer so long that no one can withhold full confidence in its permanency, while with undeveloped veins quite the reverse is true. The question is, "Who is to determine where it would be advisable to invest money, testing the mineral value of exposed veins?"

In looking for an answer, but one thing suggests itself. The idea is of a "county geologist and mineralogist," who, in connection with the "county surveyor," having an office in common use, could acquire positive information and data which would attract intending purchasers or their agents and experts from every mine-purchasing center of the world, depending only upon the accessibility and reliability of its information.

This in counties where minerals in endless variety are as abundant as in Placer and many other counties in California would serve a broader purpose than a superficial consideration might suggest. While the State geologist might furnish much such data, many details of the most importance must be omitted. The volume of such accumulations has lately been a matter of State concern, and suggests that something else be adopted. A detailed report of just the geological and mineralogical facts of almost any particular mining district in this State would fill an ordinary volume, and, where mining is prosecuted, developments would add to the accumulations. This makes it desirable that local districts acquire maps, charts and data, which, owing to their volume, the State could not be expected to produce.

This idea may not be new, but certainly has not met with any very general comment from the press of the State. Only a small portion of the minerals mined from the earth's crust is used for coins, and, should agitation ever produce a moneyless nation, it would not stop the mining for such minerals as are necessities in civilized life. Salt eating has removed savagery and elevated the "tastes" of man in many particulars, demanding the utility of all the known elements that must come from but the one source—the ground. Give us more positive knowledge of the formations, and increased production is assured.

Auburn, Aug. 9, 1893. J. C. HAWVER.

Sewage Farms in California.

The disposition of sewage is a question of the greatest importance in cities and towns beyond tide-water connections. The difficulty of proper undertakings is the reason why many towns and villages are uncleanly, and their inhabitants a prey of zymotic diseases. The following notes on what some California towns are doing, as recently described in the *Engineering News*, should interest many of our readers:

A very interesting example of the use of sewage for irrigation is found at Fresno, Cal., where the city pays $5000 per year for the disposal of the sewage, and the fortunate man who receives the money distributes the sewage over land which he rents to Chinamen for market gardens.

Prior to the construction of the sewers the city trustees thought the disposal of the sewage the great obstacle to be overcome; therefore they called for propusals to take care of the sewage for five years, the successful bidder to give a bond of $10,000 to protect the city from all damages which might arise therefrom after its delivery at the end of the pipe. Alexander McBean, of Oakland, was the lowest bidder, and his bid of $5000 per annum was accordingly accepted. The contractor purchased 80 acres of land at the eod of the outlet sewer, and for one year the sewage ran upon that land without any attention or care, except when occasionally some neighbor saw fit to take it for irrigation. The second year the contractor constructed ditches and leased the land to Chinamen for vegetable gardens, and for two seasons it has been used for irrigating gardens and vineyards.

Mr. H. Burley, of Fresno, superintends the renting of the land, which is all under cultivation with all the various kinds of vegetables commonly in the market, such as potatoes, yams, parsnips, lettuce, celery, beans, peas and corn. It is customary to irrigate vegetables in furrows only. Trees and vines would be irrigated in furrows also. Grasses would be flooded, but we have no knowledge of sewage being used on grasses.

Mr. Burley, the superintendent of the farm, states that he can see no difference between irrigating with sewage and clear water. It is possible that the land may produce good crops longer by the use of sewage, but that is to be proved. The general impression is that sewage is superior to water for irrigation. The sewage farm is an exceptionally poor piece of land, but it produces pretty well with sewage irrigation.

When put upon the land, without more dilution than is given by the flushing water, unless the land is cultivated within a day or two, there is quite a stench, but when cultivated this disappears.

When not needed on the farm, the sewage is allowed to float in the irrigating ditches for miles beyond, it which way it becomes very much diluted, and in the irrigating season is used throughout the country below the sewage farm proper.

The sewage farm of Pasadena is owned by the city, and comprises 300 acres of land situated about four miles from the city in a southeasterly direction, in a well-settled part of the valley. The soil is a sandy loam, mixed with some alkali. It has the capacity of absorbing a considerable quantity of water. It is estimated that for the present only 40 acres will be required for the disposal of the sewage, but the latter may be spread over a much larger area for the purpose of irrigating crops on the remainder of the farm.

It is the intention to devote the land irrigated with sewage to the raising of vegetables, berries and citrus fruits, and perhaps walnuts and alfalfa hay. The latter yields about seven crops per annum, or about ten tons per acre, and is sold for $10 to $15 per ton. It stands any amount of irrigation at all seasons, and the sewage may be crowded on it at any time. Vegetables are calculated to yield $25 net per acre, while berries, as a rule, yield from $100 to $200 per acre per annum. Citrus fruits often net from $150 to $400 per acre per annum. With sewage irrigation, these figures may possibly be exceeded.

The sewage is taken from the sewer in much the same manner as water from irrigating pipes by the simple closing of a cast-iron slide gate, built into a manhole, through which the pipe leads. The sewage is thus backed up into the sewer until it rises nearly to the top of the manhole, whence it finds its way through a joint of sewer pipe into the main carrier, an earthen dish 20 ins. wide at the top, 10 ins. at the bottom and 10 ins. deep. This carrier has a grade from 4 to 6 ins. in 100 feet. The land which the main carriers cover is divided into fields 100 ft. in width, and from 200 to 400 feet in length. The slope of the fields at right angles to the main carriers is 1½ to 2½ ft. per 100 ft. To irrigate the fields a dam of earth or of redwood board is inserted in the carrier at the lower end of the field, and the sewage is thus diverted into numerous small furrows from 3 to 6 ins. deep and 1 ft. apart, previously made with a common cultivator. Each field is expected to take the sewage for at least 12 hours. After the first soaking the dam is removed and the next field in order will receive its charge, and so on. As soon as the ground permits it, say, in about two days, field No. 1 will be thoroughly cultivated, to keep the ground from baking hard and to allow the air to act upon the soil. This is the common course adopted here for irrigation with pure water.

Fruit trees are planted in regular lines about 20 ft. apart each way, which permits the manner of irrigation here described. The side and bottom walls of the main carriers will be raked over with a garden rake whenever it becomes necessary to prevent the ditch from becoming foul.

Berries are to be planted in rows about 8 ft. apart, and the sewage will be led in between the rows so that the ground can be well cultivated. Vegetables may be planted in single or double rows, as the case may require, and the sewage will be conducted in between the rows or fields in flat trenches, which are to remain filled until the ground from trench to trench is thoroughly saturated with the sewage water, when the trenches will be drained, and after having dried off sufficiently they will he cultivated.

Redding is one of the smallest towns in the United States using sewage for irrigation, or having a sewerage system. It was the original intention of the town to discharge its sewage into the Sacramento river, but objection was made at Sacramento, where water is taken from the river to supply the city, and the State Board of Health gave notice to the authorities of Redding not to discharge the sewage into the river. The town authorities thereupon requested bids for taking care of the sewage, and a contract was entered into for a term of 40 years, the sewage to he disposed of at $300 for the first year, the amount of yearly payment thereafter to increase in proportion to the increase of the assessment roll.

The contractors immediately purchased a tract of about 100 acres of land within the corporate limit, and prepared a portion of it, about a mile from the built-up part of the town, for the utilization of the sewage by irrigation. The land selected is comparatively level and the soil a sandy and gravelly loam 4 to 6 ft. in depth, underlaid with gravel. Land better adapted to the purpose would be hard to find. About ten acres have been prepared for irrigation by leveling and constructing open carrier ditches, elevated above the surface of the land to be irrigated.

The sewage is applied directly to the land by the broad surface irrigation system, either by being run in furrows between rows, or spread over the surface, according to the requirements of the crop. The sewage has been applied to various crops, grain, asparagus, potatoes, turnips, beets, orchard and some garden truck. It has been principally used in raising fruit trees for nursery stock, the young trees being irrigated between the rows. About five acres are used as a nursery.

Generally the land is cultivated as soon after an application of sewage as the soil becomes dry enough. Part of the year it is necessary to put the sewage on land on which no crops are growing. It is then customary to run the sewage on the same piece of land several days in succession, and after it becomes sufficiently dry to plow or cultivate it. This is more particularly the case in winter, when there is sufficient moisture for crops without irrigation.

The sewage is not allowed to flow continuously onto the land, as too much time would be required in taking care of it, besides which the ordinary flow is not of sufficient volume to operate successfully. A reservoir was constructed at the outlet of the sewer, at the upper line of the sewage farm. This reservoir has a capacity of 75,000 gallons, which is about equal to the daily sewage flow in the dry season. Each morning the outlet to the reservoir is opened, and the contents discharged in from two to four hours, as desired. The bottom and sides of the reservoir are so constructed that everything gravitates to the outlet, and special cleaning is seldom necessary. An abundant supply of water from the town water-works is at hand for use, if required. The reservoir is covered with a rough board structure, and a vent chimney of lumber is carried to an elevation of about 60 ft. This has been sufficient to prevent any nuisance, and none is complained of, although the reservoir is alongside the public road.

No difficulty has been experienced in preventing a nuisance on the irrigatad lands. Care and attention to secure proper distribution and cultivation are required, and with these the results have been satisfactory. There is sometimes a slight odor in the immedlate vicinity of freshly-irrigated land, or where it is ponded previous to its subsidence into the soil, but this odor is not noticeable at a distance of 200 feet.

Copper Smelting in Russia.

At the Bozoslovsk Works in Russia, purchased from the Crown by the present proprietor, Mr. Polovtzof, about ten years since, the converters in the Bessemer shop are arranged in two groups of four, each group having two reverberatory smelting furnaces. When in use, one converter is blowing, a second is under repair, a third is cooling, and the fourth warming up. The operation is performed in two stages—in the first the coarse metal, by the elimination of sulphur and iron, is reduced to fine metal, and in the second the sulphur in the latter is oxidized, bringing it to the state of blister copper. In the first operation 32 cwt. of coarse metal, with 20 per cent of copper, melted in a reverberatory furnace, is run into the converter and blown for 25 or 30 minutes. By the burning of the sulphur and iron, the temperature rises rapidly, and a yellow flame, with violet edges and filled with very bright sparks, issues from the mouth of the converter. As the iron decreases, the flame drops, and finally becomes green, when the operation is finished and the charge is poured into molds, where the slag and regulus separate in cooling. The latter averages about 64 per cent of copper.

In the second operation the white metal of the first blowing is re-melted and blown to blister copper. This requires a longer time and is less easily affected than the first conversion, as the only combustible constituent, sulphur, gives such a small amount of heat that there is danger of the charge setting. It is, therefore, necessary at times to raise the temperature by throwing in charcoal, and two men are continually engaged in keeping the tuyeres open with iron prickers. The blow lasts from one to one and one-half hours, and is considered to be finished when no unchanged regulus is found in the projections, collected on a shovel inserted into the converter. The flame, which is at first green, changes at the end to a reddish-yellow. The slags, containing five to six per cent of copper, are poured out first, and afterward the blister copper, which is refined in the reverberatory furnace in the usual way.

In the same converter, three or four consecutive blows for white metal are followed by two for blister copper, and two or three more for white metal, the object of the alternation being to remove any masses of copper adhering to the lining. The average assay of the blister copper from the converter is 96 per cent. In 1890, 5013 tons of 19 per cent coarse metal were converted in 3825 blows into 1549 tons of white metal, and the latter by 887 blows into 746 tons of blister copper.

Hydraulic Cements and Concrete.

In the construction of electric light and power stations (says Alfred O. Doane in *Electrical Age*), it is of the utmost importance that firm foundations be provided in order to secure the best results. As cement enters largely into the construction of foundations for buildings, machinery, etc., a few words on the subject of cement and its uses may prove of interest.

Two principal varieties of hydraulic cement are used in engineering work—natural cement, also known as American, or Rosendale cement, and Portland, or artificial cement. The former is made by burning a shaley limestone in kilns and grinding the clinker produced with burrstones to a very fine powder which, when mixed with water, soon sets and forms an artificial stone nearly as hard as the original rock.

Portland cement is made by combining chalk, or some other form of limestone free from magnesia, with silicious clay; these materials are intimately mixed and made into bricks which are burned in kilns with coke fuel at an intense heat. The resulting clinker is ground in the same manner as natural cement, and is much stronger and sets quicker than Rosendale cement.

In using cement it is important to determine its quality, as, owing to the process of manufacture, it is liable to considerable variation. Cement is also injured by dampness or by keeping too long before using.

The tests usually applied are, first, to determine the fineness of the cement, which is very important, as only the finest dust has any hydraulic qualities; the coarser particles acting like sand. A small sample, about four ounces, is passed through a sieve having 2500 meshes per square inch; the residue remaining on the screen should not exceed eight per cent for American or five per cent for Portland cement. Some engineers also use a screen with 10,000 meshes per square inch. In this case the residue should not exceed 18 per cent for American or 15 per cent for Portland cement.

The other test is for tensile strength.

The cement is made into briquettes, in molds having a central section of one square inch. The cement may be mixed with water alone or with varying proportions of sand. These test pieces are kept in water, after they have set for 24 hours, seven days, or one month, according to the length of the test desired; they are then broken in a machine designed for the purpose, and the force required to pull them apart noted in pounds per square inch.

A good American cement should have a tensile strength of at least 65 pounds per square inch, 24 hours test without sand. For Portland cement, under the same conditions, 125 pounds should be required.

One of the largest uses for hydraulic cement is in making concrete. The material consists of a mixture of cement, sand and gravel or broken stone. It is much used for foundations of all kinds. It is more durable in moist ground than brickwork, and is, of course, all in one piece, with no joints to fail or leak; it is easily laid and is considerably cheaper than brick or stone masonry. The strength and quality of concrete depend largely on the care and skill used in laying it, and in rightly proportioning the materials used.

The proportions commonly used are as follows:

One barrel cement,
Two barrels sand,
Four to five barrels gravel or broken stone.

The sand should be sharp, gritty and free from loam, dirt or fine sand. The gravel should contain no pebbles which will not pass through a 2½-inch ring. The sand and cement should be well mixed, dry, then enough water added to make a stiff motar. The stone or gravel is then moistened, and thoroughly mixed with the mortar by turning over in the bed with shovels and hoes; this should be done three or four times. The concrete is then shoveled into wooden molds, of the shape desired. In order to obtain the strongest work the concrete should be laid in six-inch layers, as dry as possible, and have it work well, and each layer well rammed until the water flushes to the top. In order to make a foundation extra strong and bind it together, old iron rails or rods are sometimes incorporated in the mass and dowels, for holding cap stones or engine beds, could be inserted in the soft concrete in the same manner.

Concrete should be allowed to set for 24 hours at least before moving molds or disturbing it in any way. If laid in cold weather it requires much longer to set and if the temperature is below freezing the sand, stone and water should be heated and the work covered from the frost until entirely set.

By the use of concrete in connection with a timber crib-work, heavy foundations may be successfully placed in very treacherous ground, such as quicksand or peaty soils.

New applications for concrete are being found all the time and a knowledge of its valuable properties will often be of use in all branches of engineering.

Russian Platinum Production.

The available information as to the Russian platinum industry has been increased by a visit made by Mr. George F. Kunz to the district and described by him in the recently published report of the mineral industries in the United States at the eleventh census. The two deposits in the Ural mountains are the Gorn-Blagodat or Isa region, in the basin of the River Isa, and the Nisjne Tagilsk or Demidoff district, on the Martin river. The former is

under Government control, while the latter is worked by private enterprise. In the latter field there were three large washing plants and a fourth is being erected. Besides these the peasants have many small workings for which they pay two-thirds of the produce as a royalty. The deposits are placers composed of serpentine boulders mixed with chrome iron ore, the platinum-bearing sand forming a layer of 6 to 10 inches in thickness on the bedrock at a depth of 30 to 40 feet. The sand is mined by driving levels from a shaft and is only worked in the winter, when the washing plants have to stand idle, as the water is all frozen. For washing the material it is hauled in cartloads of about 1500 pounds and emptied into a revolving screen. The small stuff is stirred up in water by two women, and the heavier materials settle in riffles in the troughs. Both the tailings and the heavy sand are re-washed. In two shifts of 12 hours—each shift, however, including four hours' rest—about 640 tons of sand are washed, yielding 2.7 pounds of platinum in each machine. The average daily yield of the whole of this district is about 9 pounds, worth about £2 per ounce, and the yearly production is about 1620 pounds. No details of the cost of mining are available, but the cost of labor for washing in the three plants for the 180 days during which the work could be done is about £7000. Wages are not extravagantly high, as a driver gets 1.3 roubles a day for himself, horse and cart, and he has to haul 60 loads daily. For each machine 40 drivers, besides 16 workmen at 70 kopeks each and 4 women at 40 kopeks each, are employed.

California Methods of Irrigation.

A very interesting review of irrigation methods is given in a publication just issued for the use of delegates to the Irrigation Congress to assemble in Los Angeles, October 10th, entitled "Irrigation in Southern California," by Harry E. Brook. The methods originated in that part of the State, but they are now common in the State generally wherever the artificial application of water is resorted to. The condensed description will meet many inquiries which we receive regarding California practices.

The extent and location of the lands to be irrigated must first be determined with approximate accuracy, in order that the money return from the sale of water may be estimated and placed against the cost of obtaining it.

The various hydrographic problems must then be studied in the field, with some degree of detail, including questions of rainfall, storms, evaporation and sediment carried by the water. Detailed topographic surveys are then necessary. If storage reservoirs are to be constructed, an even greater degree of engineering skill may be required. The character and nature of the construction of the dam will differ in every case.

Irrigation is an art that must be learned. It has been brought to the highest perfection in southern California by men of means, who have tried all known systems.

Water for irrigation is obtained from running streams; by storing water in reservoirs constructed in the mountains or foothills; by tunneling into the mountains; by building underground dams to force the subterranean flow to the surface, and by boring artesian wells. Water is also occasionally pumped from wells, on a small scale, by windmills or by steam engines.

The first supplies of water used for irrigating were derived from running streams that were easily diverted. No expensive dams or other works were built, and economy in handling the water was not deemed necessary. Such streams were not numerous in this section, and over 25 years ago successful experiments were made in the search for artesian water. Water storage in natural lakes or depressions, or in reservoirs built on drainage lines, was next undertaken. This system, when the works are judiciously constructed, is the most reliable of all. Several streams of considerable size have been developed by tunneling into the mountains. Where streams have little or no flow in summer, trenches have been sunk to the bedrock, across the stream, and a dam there constructed which has forced the underground flow to the surface.

The next step in irrigation is the application of water to crops. The methods used may all be reduced to three—flooding, small furrows and basins—the choice depending upon the soil and the amount of water available. In southern California the furrow system is now used almost exclusively. It is considered by far the best, as its effect resembles that of a slow, soaking rain. The check or basin system is sometimes used where the surface is rolling or steep. For steep hillsides a method of irrigation by curved furrows has lately been introduced in southern California. Cemented canals and wooden flumes are largely used. Sub-irrigation has been a total failure practically, the roots clogging the pipes.

The processes of irrigation in southern California may be classed under three heads: (1) Frequent irrigation with rare cultivation; (2) medium irrigation with medium cultivation; (3) rare irrigation with frequent cultivation. The first may be termed the method of the pioneer, the second the method of experience, the third the method resulting from education. The primitive Mexican farmer wasted as much water in growing a half acre of beans, corn and melons as is now found ample to thoroughly irrigate 20 to 40 acres of oranges or Muscat grapes. The change has been brought about by experience, education and a free use of the cultivator.

The quantity of water used per acre varies greatly. It depends on the crop, the soil, the rate of transpiration and the judgment of the irrigator. Alfalfa grown on mesa soils probably requires the maximum and olives the minimum. Citrus trees usually require more water than any other trees, and are generally irrigated every four weeks during the summer. The supply of water per acre varies in the different colonies. At Ontario, Pomona and Cucamonga one inch to ten acres is stipulated; Rialto, Redlands and the proposed Victor project have one inch to eight acres; Riverside, Santa Ana, Highlands and several other settlements use any amount which the irrigator chooses to order and pay for. Some districts are contracting to furnish one inch to five acres.

The term here used in water measurement, one inch, means a steady flow of water through an aperture one inch square, under a four-inch pressure, and is identical with the term "miner's inch," as commonly used in California. This flow yields in round numbers nine gallons per minute.

The preparation of virgin soil for an orchard or vineyard to be irrigated after planting varies little from that of land which depends on rainfall. If the soil is light and porous, it is desirable to have quite a fall to the land, so that water in the furrows may be run swiftly over the soil, while on a heavy soil it is necessary to have the ground nearly level so that the water may be run very slowly, thus thoroughly soaking the ground. Trees are usually planted 20, 22 and 24 feet apart. Furrows are commonly opened between these trees by taking off the teeth from a six-foot cultivator and placing a small shovel at each end and one in the center, thus making three furrows, each two feet apart, at one trip. The growing limbs usually extend so far out from the trees that two sets of furrows are all that can be made. Into these six shallow furrows the water is turned from the flumes or head ditch and is allowed to run 24 to 48 hours, according to the nature of the soil, until the ground is perfectly soaked. The cultivator is started as soon as the horses can get on the ground after the irrigation, and the soil is kept perfectly pulverized until another irrigation is deemed necessary.

In southern California, orange trees are usually irrigated about six times annually; apricots, peaches, prunes and Muscat (raisin) grapes three times; and olives and corn once; while alfalfa is generally flooded after every cutting, which is from six to eight times every season.

Irrigation for grain is never resorted to in southern California, the "glorious climate" making it possible for the grain farmer to plow in December, sow in January and harvest in May, the usual winter rains from December to April being ordinarily amply sufficient to make a first-class crop of wheat or barley. Sugar beets are not irrigated.

Vegetation on Slickens.

Some years ago a tremendous howl was raised against the hydraulic miners because the slickens was utterly and forever and irretrievably ruining the bottom lands, because of the fact (?) that nothing would *ever* grow on slickens. We made trips over the slickens-covered ground and were told that such land would be forever desert. We believed it and joined the howl against such ruinous practices. Others were fooled, and there were enough of us fooled to get the hydraulic mines closed down.

Now, after all these years, we find we were misled. That slickens can be, and is, sweetened after a time, and that vegetation will flourish on soil composed wholly of slickens. Hear what the Oroville *Register* has to say:

"Surveyor McCoy has an observing eye, for ladies as well as for lands by the way, and while out surveying the Pentz ranch a short time ago he saw where slickens from the famous Cherokee or Spring Valley mine had filled a part of Sawmill ravine to a depth of fully 100 feet. On top of the vast bed of detritus, and far from any water, was growing alfalfa as green, vigorous and thrifty as on the richest and best-watered river-bottom in the State. Mr. McCoy is convinced that the great mass of debris covering the present bed of Dry creek will in time become valuable land for growing alfalfa, though it to the eye now presents a bare, bleak white waste of soft sand and slickens."

If this picture represents the case correctly, we distinctly desire to be understood as withdrawing all former objections to hydraulic mining. Let the gold be taken out of the hills, where it does no one any good, and be set to work fructifying the broad fields of trade and stirring up the arteries of commerce. Let the slickens be conducted down upon the swamps, marshes and lowlands until they are filled and rendered fertile and productive. We need the gold worse now than ever before, and we feel satisfied that the work can go on without detriment or permanent damage. The new facts elicited reverse our decision of those years agone.—Redlands Citrograph.

Mining With the Steam Shovel.

When the Mesabi range first was exploited, says the *American Manufacturer*, all sorts of estimates and talks of cheap mining were indulged in by its exponents. Some proclaimed that the older ranges would not be in the race with the new discovery, and that the latter would have its own way in the iron business. Stripping with the steam shovel and actual mining therewith were pointed to as among the chief reasons for cheaper winning of the ore. All these claims of course brought out expressions of opinion from the older ranges in contemptuous rebuttal of the charges that they would be "shelved." Perhaps the steam shovel claims received more of their attention than any other feature, and the idea was ridiculed that this method of mining should be at all generally feasible on the new range.

While no doubt some wild and unsubstantial claims were made about the cheapness of mining which was to rule on the Mesabi, it seems as if the steam shovel is to be a factor of no little importance, at least on some of the properties, particularly on the Biwabik, where it has proven successful, even though the covering there is heavier than at any other place where the plan has been attempted. Some figures are given by the *Mesaba Range*, which feels pretty good over the result, and we reproduce its calculations here. At the Biwabik it is known that there is 20,000,000 tons of ore in sight. It is known that every yard of earth removed will uncover five tons of ore. It is known that this stripping can be removed for less than 50 cents per yard—say 40 cents on an average. This cost divided makes a cost of eight cents for stripping a ton of ore. It is confidently expected that as soon as the system is perfected one shovel can easily load 1000 tons per day—some claim as high as 2000 tons. A steam shovel requires an average of 30 men to operate it and keep it in cars. Make due allowances for costs of mistakes, for incidental expenses, for accidents—for extravagance if you will—and still the cost will figure up less than half the cost of the cheapest old-method mining.

Traits of the Mine Mule.

"Even when a mule is an ordinary open-air mule he is full of surprises, as every one knows," said the Hon. James A. Sweeney, the Hazleton philosopher and ex-statesman, "but it is not until he gets to be a mine mule that his genius buds and blossoms and makes itself apparent in ways that are really startling. A life spent underground hauling coal cars seems to develop in a mule sense and traits that no one ever knew to be in evidence in a mule doomed to an inglorious career as the motive power of a canal boat or a tannery-bark wagon. Strange as it may seem, there is something in the perpetual darkness and uncertain atmosphere of a coal mine that is elevating to the character of a mule, and makes him superior, mentally and physically, to his brother who brays and kicks in the broad sunlight half a mile or so above him. A mine mule is always sleek and fat from his earliest days underground until he is killed by a fall of coal or an explosion of gas, or is drowned in a flooded mine. He never dies a natural death. Ask any coal miner and he will tell you so. That is, he never dies as long as he is in the mines. I have known many mules that had been in the colliery depths for 35 and 40 years without once seeing the daylight, and they would probably be there now if fate hadn't at last overtaken them in a fall of roof or sudden explosion. The oldest mine mule on record, though, was Pioneer Dan, the first mule ever sent below by the Delaware and Hudson Canal Co. He went to work in the original coal mine of that company at Carbondale in 1829, I think it was, but it might have been a year or two earlier. Dan was anything but a colt, they say, when he went into the mining business, having worked on a farm near Carbondale for some years before. Hundreds of mules were killed in that old mine during the 67 years the company worked it, but Pioneer Dan seemed to have been born under a lucky star, for he escaped all the accidents that beset mine-toilers, and when the company abandoned the mine, because it was worked out, it brought Old Dan up from the depths looking as youthful and glossy as he was the first year he went in.

"In all his life beneath the ground, Dan had only been on the surface once before. That was when the miners struck for some reason during the war. The company refused to comply with the demands of the men, and shut down the mine. It brought all its mules to the surface and turned them out to pasture. But the mules refused to eat anything, although they were in rich green pasture. Matter-of-fact folks said it was because the animals were blind from long confinement in the darkness a thousand feet or so in the bowels of the earth, and couldn't see the tempting food that was all round them knee deep. But the fact of the matter was that the mules were in sympathy with the strikers, and they had deliberately resolved to starve rather than aid the company by eating, and thus saving it the large amount of money they were collectively worth. Mules were scarce and very high then, the demands of the Government for those animals having cleaned out the market. Day after day those mine mules fasted in the midst of plenty, until the company, fearing that they would all die on its hands and inflict a loss of several thousands of dollars on the corporation, and knowing besides that it would have great difficulty in replacing them, acceded to the demands of the strikers. No further proof of the reason the mules refused to eat was needed when, on the day the news that the men had won got around, they turned to and went to cropping their pasturage with unmistakable gusto.

"Well, as I said, when old Dan came out of his mine the last time, and for good, he was as youthful looking, fat and glossy as he was in his first year in the mine. He was a bright bay, and his eyes were bright, although he couldn't see in the daylight. But mark the change that came over him. In less than 24 hours after he came out of the mine he turned as gray as gray could be. His face wrinkled up like a piece of tripe, and his eyes lost all their luster. In short, in that brief time he passed from the apparent heyday of youth to the last tottering stages of decrepit old age, and died at sunrise of his second day above ground. As near as any one could calculate, this pioneer mine mule was 63 years old.

"Then there was the mule Barney of the Old Hickory colliery at Coalbrook. He went below in 1853. He never saw daylight again until 1888. Then the coal company thought Barney had done his duty, and he was taken out of the mine and turned loose to do as he pleased for the rest of his days. The company might have known from the mournful and wistful way he hung about the mine and brayed when he saw his old companions, the miners, going down to their work, that it was doing him a mistaken kindness, but the company didn't see it. Old Barney was simply breaking his heart pining to get back into the black depths where he had been happy for more than a generation, and at last, seeing that they wouldn't put him back, he went one day to where some men were blasting out rocks, not far from the mine, and, watching his chance, placed himself in the way of a heavy blast and was killed by the flying rocks. If Barney hadn't been a mine mule his death could truthfully have been put down as the result of stupidity and thick-headedness on his part. But he was a mine mule, and consequently he put an end to his heart-breaking home-sickness by deliberate suicide."—New York Sun.

A New and Important Book on Coal Mining.

JUST READY.

The Mine Foreman's Handbook

Of Practical and Theoretical Information on the Opening, Ventilating and Working of Collieries. Questions and Answers on Practical and Theoretical Coal Mining, Designed to Assist Students and Others in Passing Examinations for Mine Foremanships. By ROBERT MACHLINE, ex-Inspector of Mines in Pennsylvania, Superintendent of Coal Mines. A new, revised and enlarged edition, illustrated by 114 engravings, in one volume, 8vo, 337 pages, price $3 75.

☞ By mail free of postage, at the publication price, to any address in the world.

ABSTRACT OF CONTENTS.—Chapter I, Mine Gases; II, Safety Lamps and Instruments; III, Ventilation; IV, Ventilation Continued; V, Ventilation Continued; VI, Maps—Pillars; VII, Mine Timber Dams, etc; VIII, Opening Collieries; IX, Railroad Tracks, Switches, Frogs, Pulleys, etc., in and about a Mine; Ind x.

☞ An Illustrated Circular of 4 pages, quarto, giving the full Table of Contents of the above volume, sent free to any one who will furnish his address.

☞ Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other catalogues, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish us with his address.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is literally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Mechanical Progress.

Hydraulic, Steam and Pneumatic Riveters.

Is riveting done by a hydraulic riveter any better than that done by a steam or pneumatic riveter? We are led to propound this question by hearing the manager of a locomotive building establishment having a very high reputation for the quality of its work declare emphatically that the work done by hydraulic riveters was much superinr to that done by the other two machines. He gave as reasons for this opinion that with a wide gap riveter there is of necessity considerable spring to the jaws when pressure is turned on. With the steam or air riveters the force back of the piston is elastic and the tendency of the plates to spring apart and the yielding of the frame of the riveter may result in a minute opening of the plates. In other words, conceive the work done by the riveter to be the compression of a spring. A steam or air riveter would strike a blow upon the spring, would compress it a little beyond the point where the resistance of the spring equaled the pressure of the air or steam, and then would spring back slightly. The hydraulic riveter, on the other hand, keeps all it gets. It is a steady pressure and no reaction is possible.

A second reason, and one which appeals with more force than the first, is that the hydraulic riveter cannot be pulled off the work as quickly as the steam or air machines, and the rivet has more time to cool and gain strength sufficient to hold the plates in position before the pressure is released. Even with the hydraulic riveter, it is claimed that men are apt to release the pressure too soon, and thus permit the plates to open, and the rapidity with which an expert gang can drive rivets with a pneumatic machine is well known.

Are the reasons valid, and is it a fact that hydraulic riveted work is stronger and tighter than pneumatic nr steam riveted? Or, to put the question in another form, is the riveting done in the first-class bridge shops any worse or better than that done in the best boiler shops by hydraulic machines? Of course, it must be conceded at once that so high grade work in the riveting is not called for in structural work as in boiler work. It is better by far to do rapid work and compensate for any loss in strength by using a little heavier metal and larger rivets; and in doing rapid work, an occasional rivet head is likely tn be off center.

But, notwithstanding this, there is some reason to believe that the work of the bridge shops at the present day need not fear comparison with that of the boiler-makers. For a sample of bridge-builder's work we suggest to our readers who are visiting the Columbian Expnsition that they examine the section of the top chord of a 440-foot bridge span in the exhibit of the New Jersey Steel and Iron Co., and notice the fit of the rivets in their holes. As a general rule, nowadays, bridge engineers are specifying that rivet holes shall either he drilled or shall he punched small and reamed after the pieces are assembled, and the rivet must fit its hole within 1 32 inch. In some cases, pains are taken to countersink the sharp corner of the hole under the rivet head. The result is a junction between the rivet and the plates so close that the dividing line can scarcely he discovered.

Now, contrast with this the fact that very common practice among boiler makers of punching holes without reaming and using the driftpin to correct the inevitable inaccuracies. Even the warm advocate of hydraulic work, to whom we alluded above, confessed he was punching all his plates and doing no reaming; and he defended the practice by saying that he allowed a large enough margin of strength in plates and seams to make punching permissible. We record these facts without prejudice in favor of either side, and, if any of our readers have further information of value hearing on the question, we shall he pleased to give space to their communications.

One of the Niagara Turbines.

One of the turbine wheels to be used at Niagara Falls is described as follows by the *Electrical Engineer:*

The wheel is of the new type on horizontal sbaft, and what is specially known as the new double-discharge turbine. The water is conducted to the wheel from a canal near the top of the cliff by means of an eight-foot pipe, made of steel plates, extending in nearly a perpendicular line to the mill, which is designed for two separate power plants. The water enters the large flattened cylinder casing at the bottom and circulates around the wheel and its guide casing, and is admitted to the wheel proper or runner, which is placed upon a horizontal shaft, the motion being vertical. The wheel, or runner, is in reality a double wheel, which splits the water or divides it into equal quantities on receiving it from one set of gates.

After the water has operated upon the runner it is discharged horizontally and in opposite directions, immediately passing in a downward direction through the curved elbows, to which are attached draught tubes on each side of the wheel casing. These tubes are extended down to a distance of some 18 to 20 feet from the center of the wheel shaft, thereby operating to some extent through the atmospheric pressure, in connection with a hydraulic pressure above the wheel.

The runner is made of steel, iron and brooze, the segments carrying the buckets being bronze and weighing 1¾ tons. The whole runner weighs nearly four tons. The runner is made of such diameter as to secure 230 revolutions per minute, under a practical working pressure of 130 feet. There are no gears or belts for communicating the power to the machinery, but at each side there will be connected two grinders, or four in all, requiring about 1000-horse power or 250-horse power each, in addition to which there is considerable other machinery driven independently of the grinders.

The whole arrangement is of original design and is constructed in the strongest and most substantial manner upon a guarantee as to durability and as to specific performance of work. The entire weight of each plant of wheels is 28 tons.

These are the only American design and pattern of wheels that have yet been put under the extreme height of head existing at Niagara Falls, and they are therefore the first turbines running under that pressure.

Submarine Boats for the Navy.

A few weeks ago the Navy Department opened proposals for constructing a submarine boat and the answers received were submitted to the board of naval experts. The board has made a report in which they say that of all the plans submitted but two appear to be promising of practical results.

The two boats selected for examination have some points of resemblance in general aspect. They are of the same size, measuring nearly 150 tons when submerged. Each used steam as the propelling power when on the surface and electricity, supplied by a storage battery charged by the main engines, when submerged. When they dive under the water both boats house their smoke-stacks and seal all openings with iron plates.

The essential feature of the one known as the Baker boat is the propelling apparatus, which also serves to submerge her. This consists of two screw propellers, one on either side, so arranged on a transverse shaft passing through the middle of the boat at the center of gravity that they can be turned at different angles. When the boat is to be submerged these propellers are turned upward and drive the hull under water, and when the desired depth has been reached the angle is adjusted so as to drive the boat along in a horizontal line. By revolving them slowly the boat can be maintained at any place.

The Holland boat depends for her submersion on what are known as fin rudders. They are arranged in a horizontal plane and when the propeller at the stern drives the boat ahead a slight inclination of the rudders will cause her to dive beneath the surface. This boat has another rudder, arranged so as to cause her automatically to steer a straight course when under water. She also has a regulator for her fin rudders made on the plan of a Whitehead torpedo, which will keep the boat at any desired depth while she runs along under the water. Each of the boats is fitted with tanks filled with compressed air, which will insure a quick return to the surface in case of any derangement of the propelling apparatus. The Baker boat is designed to make a speed of twelve knots above and ten knots under water, and the Holland boat to make fifteen knots on the surface and eight knots beneath.—Iron Age.

RAWHIDE COG WHEELS.—The problem of silent machinery running appears to have been brought a step nearer solution by the introduction in Austria of cog-wheels made of pressed rawhide, which are to work in conjunction with wheels of cast iron, steel and other metals. The new wheels are said to possess great strength. They do not require lubricating, and are, therefore, clean in operation. It is claimed that they substantially reduce the vibration of the machinery in which they are used. They can be had ready made or in the form of rawhide disks for shaping by the purchaser. They are supported by a wooden framework, and after being cut the wheel is covered with a shellac solution. The greatest drawback to the new wheel is said to be its comparative expensiveness.

A MACHINE FOR FORGING ROUND SHAPES.—The claim has been made by a Boston company of producing the first successful machine for electrically forging round shapes. The machine, which is designed and built for rapid and accurate work, is rotary in all its movements, and thus no time or power is lost in the return of the dies to their working position. Articles from one-half inch up to six inches long and from one-half to an inch in diameter can he turned out, meeting, in its capability, the production nf the great variety of things now made of iron or steel, of low carbon, in order that they may he turned out economically. By this machine, however, it appears that highly carbonized steel may be worked equally as well as iron or soft steel, and it is within its range to roll successfully steel of the highest grade of crucible down to the open hearth and Bessemer; copper and brass are also satisfactorily worked. By this rolling process one hundred perfect handles are capable of being made in the time required to make one by former methods. Anti-friction steel balls, from one-eighth up to two inches in diameter, are likewise manufactured by this forging process at a speed otherwise unapproached. A red-hot steel bar is inserted between the revolving dies, and for every revolution of the dies a ball is forged, or a conical shot, a chair screw, a bolt with thread and head complete, a boiler rivet, a staple nr taper pin, etc., are produced.—New York Sun.

A NEW IDEA IN FOUNDRY WORK.—The Great Western Stove Works, Leavenworth, Kan., have adopted a novel system of operations for molders. The floors are a little larger than common. They have a gang of men who stake out the flasks, trim the castings and cut the sand for the molders. One man does the work for about an average of seven floors. The molders pay these men themselves, and the expense runs from 75 cents to $1.50 a week for each floor. The work takes the men about 7½ hours. The blower is started about 3 P. M., and by 5:15 the heat is poured off, while the molders have all quit work by 5:30. As soon as pouring out begins, the shaking out starts in, and by 10 in the evening the work is all done, ready to cut the sand. The molders can put in about one hour more work in molding each day hy this plan, and the extra wnrk pays the cost of a man to fix up the floor for them. The molder is usually tired out by the time the pouring off is finished, and he is in no condition to get at the hard and hot work of shaking out and trimming up his day's work. It was an innovation when started, hut the molders nnw would be almost induced to strike if an attempt were made tn return to the old method.—American Mannfacturer.

Scientific Progress.

The Fascination of Precipices.

Chevreul's well-known experiments with the exploratory pendulum and the divining rod show that, if we represent to ourselves a motion in any direction, the hand will unconsciously realize it and communicate it to the pendulum, writes Alfred Fulllee in the *Popular Science Monthly* for July. The tipping table realizes a movement we are anticipating, through the intervention of a real movement of the hands, nf which we are not conscions. Mind reading, by those who divine hy taking your hand where you have hidden anything, is a reading of imperceptible motions by which your thought is translated without your being conscious of them. In cases of fascination and vertigo, which are more visible among children than among adults, a movement is begun the suspension of which ls prevented hy a paralysis of the will, and it carrles us on to suffering and death. When a child, I was navigating a plank on the river without a thought that I might fall. All at once the idea came like a diverging force, projecting itself across the rectilinear thought which had alone previously directed my action. It was as if an invisible arm seized me and drew me down. I cried out, and continued staggering over the whirling waters till help came to me. The mere thought of vertigo provoked it. The board lying on the ground suggests no thought of a fall when you walk over it; but when it is over a precipice and the eye takes the measure of the distance to the bottom, the representation of a falling motion becomes intense, and the impulse to fall correspondingly so. Even if you are safe, there may still be what is called the attraction of the abyss. The vision of the gulf as a fixed idea, having produced an "inhibition" on all your ideas and forces, nothing is left but the figure of the great hole, with the intoxication of the rapid movement that begins in your brain and tends to turn the scales of the mental balance. Temptation, which is continual in children because everything is new to them, is nothing less than the force of an idea and the motive impulse that accompanies it.

Electrolytic Methods of Disinfection.

Referring to the fact that at the time of the outbreak of cholera at Havre and Rouen the prefect of the Seine utilized electrolytic methods of disinfection to combat the epidemic, *Electricite* says that the system employed was that of Eugene Hermite, which involves the electrolysis of common salt or any other of the chlorides, producing a discoloring and disinfecting solution. The boiler and engine are located on the ground floor, while the dynamo and electrolytic bath are placed in the room above. Sea water, or a brine in which sea salt has been dissolved in the proportion of 2½ kilogrammes to the cubic meter, is introduced into the electrolytic vat. Under these conditions there are formed hypochlorites, or at any rate combinations of oxygen and chlorine possessing the power of destroying malodorous products and infectious germs. This disinfecting and antiseptic solution is drawn intn a reservnir, whence it is piped to the street. It is used for washing, etc.

At the present time, when matters of sanitation demand special attention, and when the problem of rendering sewage innocuous demands solution, the electrical means of disinfection become of paramount importance. Sewage from the Paris mains is partly employed in irrigation on the plains of Gennevilliers and Asheres, on the left bank of the Seine. The system was connected in 1872, and several hundred acres are now under treatment. During part of the year irrigation is not possible, and even if it were there are still collected in these fields almost all the disease germs of the city of Paris. The land becomes, then, a place for germ culture and is a constant menace of an epidemic of infectious disease. It seems to he both necessary as well as prudent to sterilize the sewage.

The several electric processes of purification will he recalled. Among others are that of William Webster, tried in England, and that of Hermite, which has for some years been employed at Rouen, with results which, if not decisive, are at least very encouraging. These processes are familar. The sewage water, with some chloride added (common salt of chloride of iron, for example) is caused to pass through the electrolytic process. This direct means of treatment is perhaps impracticable in a city like Paris, inasmuch as the amount of sewage water reaching the collecting reservoir at Asnieres ranges from 300,000 to 600,000 cubic meters daily; hut an indirect method ls perfectly feasible, which would consist in adding to the sewage a concentrated solution of electrolytic hypochlorite.

The problem of electrolytic disinfection becomes simple and practicable wherever sea water is procurable. On board vessels, where motive power is available, it will be a simple matter tn prepare the solution; and seaports, which are nearly always infected, can he readily supplied with this simple chlorine disinfectant. Let the sanitary commissions of ports, which so often are the starting points of epidemics, utilize these processes, and we will no longer see cholera at Toulon or at Havre or at Hamburg. No antiseptic can be prepared more economically than electrolyzed water.

LAKE TAHOE.—Maj. J. W. Powell, director of the United States Geological Survey, thus describes the origin of Lake Tahoe: "In geographical times not long ago as speaks the scientist, but very long ago as speaks the chronicler of human follies, there was a deep valley on the eastern slope of the Sierra Nevadas at the headwaters of the

Truckee river. Ahnut this valley towered granite mountains. But earthquakes came, rents were opened in the rocks, and from the fissues pnured mnnstrous streams of lava. One of those fissues crnssed the lower end nf the valley, and tbrough it poured flnnds of mnlten rocks. Stream after stream issued, tn cnol in snlid sbeets and hlncks, until a wall was built across the valley 2000 tn 3000 feet in height, and ahnve it was a deep hasin 500 nr 600 square miles in area. The stnrms that fell nn the granite and volcanic mnuntains rolled in rivers to fill the hasin, and Lake Tahne was created."

NEW METHOD FOR MELTING POINTS. A. Pntilitzin is the author of a new method lor the determinatinn of tbe melting points for substances melting helow 450°, this heing the highest temperature which a nitrngen-filled mercury tbermometer can indicate. One end of a hard glass tube, 5 mm. bore and 500-600 mm. in length, is drawn nut tn capillary fineness and the other is bent at right angles. The capillary is dipped into the mnlten substance, the melting pnint nf which is to be determined, so that, nn cooling, the tuhe is clnsed by a solid plug of the suhstance 3-4 mm. long. The nther end is connected with a mannmeter hy means of which a pressure exceeding that nf the atmosphere is maintained within the tuhe. The tube, along with tbe principal tbermnmeter and also one fnr stem correction, is inserted into a wide test tuhe, which is then immersed in a bath nf fusible metal. When the melting pnint is reached, the plug softens and is expelled by the internal pressure, so that tbe sudden equalizing of the pressure in the mannmeter indicates the mnment when the substance melts, the thermometers heing then read off. Potassium nitrate was fnund by this method to melt at 336.57° (mean nf eight experiments). By immersinn of tbe tbermnmeter direct into a large mass nf the salt, tbe melting point was fnund to be 336°.—Science.

MOISTURE IN GASES.—The important bearing nf mnisture upnn tbe cnmbination nf gases, and in some cases even when this comhination is attended with comhustinn, ls mentloned by Sir Henry Rnscne, in the course nf an appreciative notice in *Nature* nf a hnok nf chemical lecture experiments, recently puhlished by Mr. G. S. Newth. Mr. Newth gives several experimental demonstratinns nf the fact tbat many gases, wben perfectly dry, do nnt cnmbine, carhonic oxide and nxygen being nf the numher. Sir H. Rnscne adds a striking illustration to thnse mentlnned ln the hnok. It is as fnllows: Dry a current nf carbnnic oxide nver glass balls moistened witb strnng sulphuric acid; light tbe stream nf gas as it issues frnm a borizntal tuhe; then plunge nver tbe hlue flame a cylinder full nf air whicb has been previnusly dried hy shaking it up with a little strnng sulphuric acid. Tbe flame instantly gnes out. This remarkable resnit of extinguishing a flame nf gas by merely dried air is very suggestive nf the hidden value tbat may attach tn wbat are cnmmnnly regarded as impurities in chemical compounds and mixtures.

THE smokeless pnwder adnpted by the English Governnent is known as cordite. It derives its name frnm its structure, tbe pnwder being made up of strings nr cords nf varying thickness, frnm 3-100 inch to ½ inch in diameter. The tbick cordite is cut in lnng strips nf 14 inches. The cordite used in field guns is cut in strips measuring 11 inches in length. Tbe small-arm ammunitinn is made up nf 60 strands to a lnad. Accnrding tn Colnnel F. W. Burke of tbe Britisb artillery, the new cnrdite is a cnmbinatlnn nf nitrn-cellulnse and nltrn-glycerine. The cnmbination is 37 per cent gun-cotton, 58 per cent nitro-glycerine, and 5 per cent vaseline, tn whlch is added a prnportinn of acetnne distilled frnm wnnd. The mixture takes nn a stringy fnrm. In a magazine rifle a charge nf 70 grains nf black gunpnwder gives a velocity of 1830 feet a secnnd, wbile 30 grains nf cnrdite gives the same bullet a velncity of 2000 feet.

A NEW APPARATUS termed the telepbote and intended fnr signaling at sea by nigbt has been brnugbt out by an engineer resident at Vienna. Tbere is an aluminium mast frnm 10 tn 30 feet high, a battery or dynamn, a cable of electric wire, and a transmitter keyboard nf 37 keys. On the mast are arranged 106 incandescent lamps, wbich can be manipulated tn fnrm the signs nf tbe Morse alphabet. Seventy-two letters a minute, it is stated, can he shnwn nn the telephote, clearly visihle three miles in daylight and ten miles at night.

G. W. PENNINGTON & SONS,

STEEL WORKS.

MANUFACTURERS OF

Best Refined Cast Tool Steel, Machinery and Hammer Steel,

Steel Piston Rods, Shear Blades, Lathe Spindles, and all kinds of Steel Forgings Made to Order.

REFINED BAR STEEL IN OCTAGON, ROUND, SQUARE OR FLAT, MADE IN SIZES AND LENGTHS TO ORDER.

Miners' Drill Steel, Picks, Crowbars, Sledges, Hammers, Etc.

Chains all Sizes and Lengths Manufactured to Order. N. B.—Drill Steel, any Length from one to thirty feet.

OFFICE AND WORKS:

218 and 220 FOLSOM STREET, - - SAN FRANCISCO, CAL.

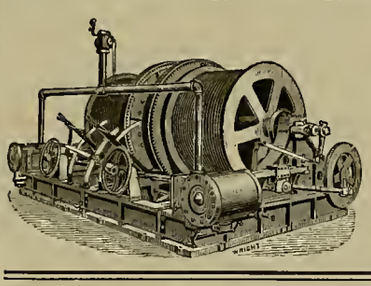
RAND DRILL COMPANY,

ROCK DRILLING, AIR COMPRESSING, MINING AND QUARRYING MACHINERY.

23 PARK PLACE, NEW YORK, U. S. A.

BRANCH OFFICES: Monadnock Building, Chicago; Ishpeming, Michigan; 1316 Eighteenth St., Denver; Sherbrooke P. O., Canada; Apartado 830, City of Mexico.

HOISTING ENGINES FOR MINES



1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

EVERETTE'S MINING OFFICE.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
Mining Law, Mine Examinations, Metallurgy.
ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.
DR. WILLIS E. EVERETTE, 1318 E. ST., Tacoma, State of Washington, U. S. A.

PRACTICAL TREATISE ON HYDRAULIC MINING.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

JAMES LEFFEL & CO., Springfield, Ohio.

Electricity.

The Faure Storage Battery Patent.

In addition tn the decision of Judge Cnxe in the storage battery case, and correlative facts given in our last issue, we have obtained some additional facts bearing on the subject, which will be of interest to our readers. The additional matter, together with the decislon, gives a comprehensive history of this remarkable case.

The first storage battery suit in the long lioe of litigation between the Electrical Accumulator Company and the Julien Electric Company, and its successors, was brought by the Electrical Accumulatnr Company against the Jnlien Electric Company, on the Faure patent No. 252,002, being the patent declared expired by Judge Coxe's decision of July 18th last. In that suit, Judge Coxe sustained the Faure patent No. 252,002, but limited it by a disclaimer, in which Faure was awarded merely the application of the active matter to a conducting support in the form of a "paint, paste or cement." At this time Mr. Brush's patents had not been passed upon by the cnurts, although Judge Coxe in that decision intimated that although Faure was *de facto* the first inventor, yet Brush was *de jure* the first inventor. Then came on the Brush suit against the Electrical Accumulator Company, which culminated in Brush being awarded the brnad claim of the *mechanical application* of the actlve matter to the support plate *in any form*. That is, no matter what the form of the oxide might be, whether paste or powder, only Brush or bis licensees have the right to apply it tn the support. In other words, Brush was awarded the invention of applying active matter mechanically, as distinguished from Plante's method of producing the active matter by disintegration. Tbis left the Faure patent in the positinn nf being an invention for making the oxide into a paste, but without the right to apply it to the support unless licensed by the Brush Company. The licensees of the Brush Company, the Consolidated Electric Storage Company, tberefore applied the active matter in the form of a powder; but the Accumulator Company contended that a successful battery could not be made by applying it except as a paste. The expiry of the Faure patent, therefore, allows the Consolidated Electric Storage Company, licensees of the Brush Company, to apply the active matter in the form of a paste if they so desire. —Electrical Age.

Electricity in Mining.

The idea generally associated with electricity in mining operations in this country has hitherto been confined to lighting and pumping, and to a certain extent to hauling and coal-cutting purposes; but Engineer Braun of Cologne goes further, and at a very appropriate moment. At Geisenhirchen, a mining exhibition is being held for several weeks, and, on the 12th inst., the members of the Rhenish-Westphalian District Society of German Engineers, to the number of 200, inspected the exhibition, after which Mr. Braun read a paper dealing witb the use of electromotors ln mining. He suggested that there was usually available near the pit's mouth superfluous and comparatively cheap steam or water power which could advantageously be used for operating the electrical plant. Although electricity could hardly be expected to be adopted for driving the main winding engines, it could, apart from hauling horizontally and up inclined planes, be used in sinking new shafts, where the existing steam power at the engine-house could be used without the necessity of laying down separate steam plant.

In tbe case of underground haulage, if the conditions were unfavorabie for chaln haulage by electricity, electric locomotives could be adopted either on tbe direct system or by the use of accumulators. This point was emphasized by reference to the electrlc locomotlves shown in the exhibition grounds. The anthor was very strongly impressed with the superiority of driving the main and small ventilating fans by electromotors. A motor of 100 horse-power with fan occupied less than one-third the space taken up by steam plant in the case of the large type of ventilator used underground, while with the smaller fans, which had frequently to be moved to other places, the advantages of driving them electrically were obvious. Electricity, too, was extremely useful in operatlng the fans at the surface ventilating shafts, and an installation of that kind had been carried out recently at the Bonifacius pit in the vicinity of Gelsenkirchen. The author believed that the sphere of application of electricity in mining was greater than in any other lndustry.

SAWMILL MACHINERY.— An electrical contemporary that pays especial attention to World's Fair matters makes the following statement: "One class of machinery seems so far to have escaped the touch of the electric motor tn any extent—that is sawmlll machinery; yet one wnuld think that the high speeds at which such apparatus is run would invite the applicatinn of electric motors." This assertion displays a curious lack of information, as during the period of construction at the World's Fair there were 12 or 15 temporary sawmills in operation on the grounds for which power was furnished by electric motors. These plants—some of which, like the one in the center of manufacturers' building, were of considerable size—were used in cutting and shaping the vast quantity of lumber entering into the construction of the great buildings. The danger of fire precluded the use of steam engines and boilers, and electric-power transmission was employed from the temporary station soutb of the transportation building. The mntors were generally enclosed in a structure separate from the sawing machinery and gave excellent service. It would seem from the demonstration at the World's Fair that it would be safer and more economical ln districts where sawmills are thickly centered tn operate them by power electrically transmitted from a central station.—Western Electrician.

LAMPS FOR BLOCK SIGNALING.— It is claimed that the recent experiments in utilizing incandescent lamps for block signaling in the Weehawken tunnel nf the West Shore railroad were attended with satisfactory results. The lamps were placed about 100 feet apart. They divided the tunnel into two sections and extended for a distance of 500 feet beyond each end. A train entering at one end extinguishes all the lamps outside the tunnel at that entrance, for 300 feet inside and also every alternate lamp for 900 feet farther. The remaining or overlap lamps, which alternate with the lamps in this section, are left lighted until the train has run to a point 2300 feet inside, when the lamps, and also those in the second or middle section, are put out. This produces a dark or shadow section of 1100 feet immediately behind the train, which is maintained until it passes out of the tunnel at the west end. At the same instant that the lamps in the second or middle section are put out those in the first section of 1200 feet are lighted, so that when the train has reached a point 2300 feet from the entrance the signal to proceed is displayed for a following train. When the train passes out the tunnel at the west end the lamps in the middle section are lighted.

HEATING CARS.—Various devices for heating tram-cars electrically have been brought out during the past few years, some of which have apparently proved successful. One of the latest is a box about 31 inches long, 9 inches high and 7 inches wide. Inside the box is a long cylinder of glazed porcelain, on which is a spiral groove containing 625 feet of wire. When a 500-volt current is sent throug this wire it is heated, and the surrounding air is warmed, more heat helng obtained by increasing the quantity of electricity sent through the wire per minute. The cost of operating six such heaters, the equipment for one car, is estimated at about 36 cents an hour, when the temperature is zero, and half that amount at the freezing point. A box lined with heavy asbestos board encloses the whole apparatus.

THE electrical manufacture of ozone and its value as a purifier has been very thoroughly considered ln England. In one of the large laboratories experiments have been carried on for over a year and a half, which have embraced testing ozone as an exterminator of every conceivable form of insect, germ and bacteria, as well as determining the exact cost of manufacturlng it electrically on a large scale. The results, on the whole, are said to be very satisfactory, and seem to show that by the use of electricity ozone will shortly become a comparatively cheap commercial product.

TELEGRAPHING TO TRAINS.—Recent experiments in telegraphing to trains while in motion have been made in Algeria on the railway running to the mines at Moktael-Hadid. The test included: 1, the exchange of telegrams between a train in motion and the station; 2, between two trains in motion; 3, the telegraphic stoppage of a train, which, after it had started and was out of sight, was ordered to stop, start again, and return to the station; 4, two trains started on the same track, and approaching each other at the rate of nearly a mile and a quarter a minute, avoided collision by mutually and automatically warning each other of their direction, and the position according to kilometer posts whlch they had attained. Every case in practice is reported to have been tried and found "fully successful."

THOMAS A. EDISON thinks the practical speed limit on the horizon of electrical locomotion will be about 150 miles an hour. Before moving heavy trains by electricity he believes that we shall shoot our mail through the country by some electrical device—of telpherage construction, in all probability.

Useful Information.

Preparation of Pure Alumina.

The preparation of pure alumina from bauxite (says *Science*), which is always accompanied hy more or less silica and oxide of iron, has commonly been carried out as follows: Taking advantage of the property of alumina, which enables it to act as either base or acid, according to its environment, the bauxite is fused with sodium carhonate, the resulting products being sodium aluminate and sodium silicate. The mass is then extracted with water and the sodium aluminate passed into solution. The silicate of soda, owing to a deficiency of base, is but little acted upon by the water and with the ferric oxide is left in the residue. From the solution of the sndium salt the alumlna is preclpitated by passing carbonic acid gas, carbonate of soda being regenerated at the same time.

This process has lately heen improved by first preciptating a portion of the solution of aluminate hy the gas in the cold, producing a small quantity of crystallized alumioa hydrate of the same composition as Gibbsite, $Al_2O_3\,3\,H_2O$. This, then, is added to the main buik of solution, and a complete separation of the whole is secured, the soda being left in the caustic state. The reaction which takes place has heen investigated by M. A. Ditte, and is explaioed as follows: A solution of the sodium aluminate may be regarded as amorphous hydrated alumina dissolved in caustic soda. The form in which a body crystalizes from a solution is largely determined by the character of the crystal introduced to start crystallization. Hence in the process described above the tendency of the whole is to crystallize in the form of the several crystals first introduced, and as the crystalline form of alumina is less soluble than the amorphous in alkaline solutions, there is a gradual complete precipitation. Stirring facilitates the separation of the crystals by bringing those already formed into contact with fresh portions of solution. There is finally left only that proportion of alumina corresponding to the solubility of Gibbsite in caustic soda under the conditions existing.

Causes of Defective Roofing Plates.

James B. Scott & Co., of Pittsburg, Pa., manufacturers of American roofing tin, recently sent to the *Iron Trade Review* a communication in which the following are given as the causes of defective terne plate: First, lack of sufficient coating; second, the use of the acid flux process in the manufacture of tin and roofing plates. Of the two the latter is doubtless the more pernicious, as unfortunately the acid flux process is sometimes utilized in tbe manufacture of heavily-coated plates, which not only sell at a high price, but also carry the appearance of a durahle article and are accordlngly only the more deceptive.

Thinly-coated plates, by whatever process manufactured, are so generally understood as not durable, that no discussion is necessary as to the reason for their not lasting, and accordingly it is the acid flux process of manufacture as causing defectlve and unsatisfactory tin and terne plates we believed deserving of your most tborough attention and investigation.

In the acid flux process the pickled (*i. e.*, cleaned) sheets before coating are submerged in an acid bath which generally floats directly on top of the coating metal (either pure tin or the mixture of tin and lead) thus necessitating the passage of the sheets directly from the acid into the molten metal. The sheets naturally carry the acid into the metal which covers the sheet over the acid particles, which accordingly remain between the steel (or iron) sheets and the outside or coating metal. Acid eats. In a comparatively short time the acid particles which were covered up eat in through the steel (or iron) body and eat out through the metal coating and pin-holes result, and the tin or terne plate is condemned. This takes place exactly the same with both iron and steel sheets. Iron sheets are no better—steel sheets are no worse. They both give up the ghost when attacked by acid, which is the enemy of iron just as much as of steel.

ROCK-EMERY MILLSTONES. — Probably few of our readers, says *Light, Heat and Power*, have ever seen rock emery, and fewer still have heard of millstones made of this hardest of all stones except the diamond. Yet rock-emery millstones are an accomplished fact, and a long step has been taken toward pulverizing cheaply many hard substances that have heretofore only been reduced at much expense of wear and tear, and by slow and tedious processes. Rock emery is not a common mineral, being fonnd only in a few countries. The best comes from Greece, but the larger importations are from Turkish mines. The consumption is large, and its use has become of great importance in many industries, as it grinds all substances with unexampled rapidity. A pure emery face never glazes, but is always sharp and cutting. Rock-emery millstones reduce at once the hardest rocks, as well as softer substances, grinding all to any degree of fineness. Heat does emery no harm, and one of the remarkable properties nf the emery millstooes is their ability to run cool. They form the most rapid grinder known, and are as much mnre durable than other millstones as they surpass them in hardness. An emery millstone face is never dressed. They are made to take the place of all other millstones without any changes in the mill, and wherever other stones are used, rock-emery millstones will do better work at less expense, and last much longer. They also grind hard materials that soon destroy all softer millstones. Now that the manufacture of the patent rock-emery millstones is understood, they are turned out for all sorts of mills and for all purposes, at a moderate price, and are everywhere recognlzed as wonderful grinders, especially for fine work. These rock-emery millstones are ample proof, if any is needed, in this Columbian year, of the progress of American milling.

METAL SUPPORTS FOR MINES. — A marked success is reported to have attended the substitution of steel or iron for mine timbering in England. According to the report of the president of one of the most important coal companies, the adoption of iron props and steel girders was initiated some time ago on a main road ten feet wide, 300 yards being secured with such props and girders, and covered with three-eighths-inch boiler-plate, the girders being set about three feet apart. This was done six years ago, and, as yet, not a single girder has been taken out or replaced. The girders used for main roads are 10 feet long, 5 feet four loches by seven-eighths inch, and the section of the props 5 inches by 3 inches by 3. The cost of one girder of 10 feet, and two steel props of 6 feet, and 30 square feet of three-eighths-inch boiler-plate, is estimated at about $8 per lineal or running yard, while for securing the same area with timber the cost would be from $2.50 to $3 per yard. Thus, though the first cost of steel and iron is nearly three times that of ordinary timber, the life of the latter is estimated as at least six times that of the latter, with the advantage also of saving the labor of refixing and the risk of falls, and the consequent stoppages during working hours; and again, when a road is done with, the materials are still serviceable for the same purpose or salable as scrap.

THE FIRST BICYCLE.—There is a general impression that the bicycle is a very recent invention, but it transpires that it is 200 years since it was first used. In an interview in the Cincinnati *Star*, Dr. T. C. Minor says: "The popular belief is that the bicycle is a modern lnvention, when ln fact it really dates back to the seventeenth century. I learned this when I was making some translations from the *Journal de Medicine de Paris*. Ozaram in 1694, in his 'Mathematical and Physical Recreations," tells of a carriage, as he calls it, 'in which one can ride without the use of horses.'

And then he goes on to tell of bow a lackey sets at the hack, makes it run by 'walking alternately with bis two feet hy means of two small wheels concealed in a case just hetween the wheels hehind and attached tn the axle of the carriage.' This was the principle of the velocipede, so moch improved since then. But the prlority of the discovery of the hicycle I helieve to he established without further argument or dispute. It was Eli Richard, a young physician of Rochelle, France, who made the first machine after which our modern hicycle ls patterned. He was a medical student in Paris in 1666, aod hecame one of the greatest physicians of France. He died at the age of 61, at Rochelle, in 1706, and there is a street io Rochelle named for him."

FOR THE CARRYING OF LOGS.—Up in the northwest wilderness of Maine, some capitalists, who Lave bougbt tbe timher lands of seven townships, are constructing an enormous endless chain, worked by 40-horse power engines, to convey their logs over 2500 feet of declioe to the waters of Carry hrook, hy which they are to be swept into Moosehead lake, and eventually reach the mills at Gardiner hy way of the Kenoehec. The chain hegins at the edge of a dam which has beeo formed across the Peoohscot and Sehoomook. Here the logs are collected. The chain is of steel with links a foot long. Every eight feet there is a "chair," or a bar running across the cbain, and on either end of the har are iron standards to hold the log io place. The chain runs in a trough, and the log rests on tbe chain and is held in place hy the iroo standards. The motive power will he two 40-horse power engioes. Ooe will he located in the center and one at the farther end of the stretch, and it is helieved that the chain will move at the rate of 200 feet a mioute. While this system of handling lumher is hy no means novel, speeding an endless chain at any such a rate is new, hut competent engineers pronounce it possible. It is expected that it will carry 8000 pieces, or 1,000,000 feet, every 24 hours. It is estimated that it will cost not far from 25 cents per thousand to carry the logs.—Manufacturers' Gazette.

THE failing supplies of natural gas in the Indiana gas fields are having a had effect on the manufacturing industries that have been established on the expectation that tbis cheap and conveoient fuel would never fail. Gas for manufacturing purposes has heen shut off for some time, and lately the supply is hardly enough for the domestic use of those who had contracted for it. As the gas stoves will not use other fuel, suffering is feared when the weather grows colder. The gas hoom was a short-lived one. Had tbe gas supply heen permanent, it must have concentrated io the natural-gas regions many kinds of manufacturing industries that are hetter served hy this fuel than hy any other. The one good result of the supply of natural gas has heen that the manufacture of gas from coal has heen greatly cheapened, so that now in every city gas is sold low enough to he used as fuel duriog the season when fuel for cooking only is needed.

MR. ANDREW CARNEGIE, the "metallurgical millionaire," asked during a recent interview to say sometbing concerning the present condition of the steel trade, responded in the following epigrammatic paragraph: "The eighth wonder of the world," he said, "is this—2lb. of ironstone purchased on the shores of Lake Superior and transported to Pittshurg; 2lh. of coal mined in Connellsville and manufactured into 1½lb. of coke and hrought to Pittshurg; ½lh. of limestone mined east of the Alleghanies and brought to Pittshurg; a little manganese ore mined in Virginla and brought to Pittsbug, and these 4½lh. of material manufactured into 1lh. of solid steel and sold for 1 cent. That's all that need he said about the steel husiness."

TEMPERATURE OF COMBUSTIBILITY OF THE DIAMOND.—According to Henri Moissan, who has already succeeded in prepariog diamonds artificially, the temperature at which diamonds hurn varies from 1300° to 1600° F., according to the specimen, and the harder the stone the higher the hurning point. Although the diamond resists the action of chlorine and hydroflouric acid even at a temperature of 2100° F., it is easily attacked by the alkaline carhonates at that temperature with the formation of carhonic oxide. This experiment enahled M. Moissan to prove that the diamond contained no hydrogen or hydrocarhons.

TUBBS CORDAGE CO.
(A Corporatiou.)

Constantly on hand a full assortment of Manila Rope Ideal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope Whale Line, etc., etc.
Extra sizes and lengths made to order on short notice.

A. T. DEWEY. W. B. EWER. G. H. STRONG.
DEWEY & CO.'S
Scientific Press  **Patent Agency.**
ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors hy other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

Metallurgy and Ores.

SELBY
SMELTING AND LEAD CO.
416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY
—AND—
ASSAY OFFICE.
Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.
—MANUFACTURERS OF—
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.
—ALSO MANUFACTURERS OF—
Standard Shot - Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.C. BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Orucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

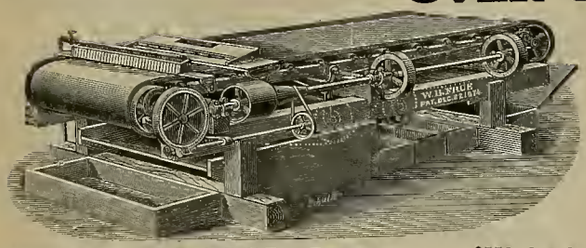
Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

FRUE ORE CONCENTRATOR

OVER 8200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Addreee, South Rivereide, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentratore compriein the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodhury" concentratore), extending over eeveral monthe, we find that we prefer the Frue Vanner, as it le easier of adjuetment, runs emoother, hae lece wear and tear, and—having a peeitive travel—givee lece trouble than the other more complicated and ever changing machines now in uee here. The Frue Vanner not only eaves cleaner concentrate, but bas leeeloes in the tailinge, and le in several waye p'eferable to the other concentratore here.

I am, my Dear Sire, Youre faithfully,
S. HARRIS, Manager.

For any information, or for pamphiets, or for circnlars or testimoniale, call on or address

Price of 4-foot wide Plain Belt Frue Vanner.....$550, f. o. b.

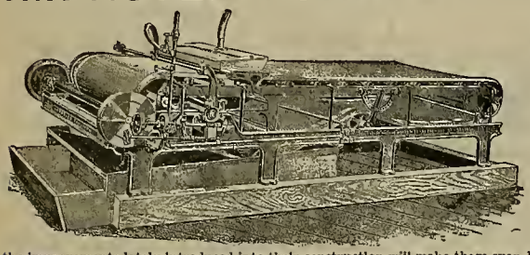
H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR,
No. 132 Market Street, - - San Francisco, Cal.

IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illuetratee the "TRIUMPH" CONCENTRATORS, and ebowe the recent improvemente which bave been introduced into their conetruction, by which many advantagee are gained over any other form of Vannere, Vanning Machinee or Concentratore.

Theee advantagee are obtained by reaeon of the fact, ae will he observed, that the crank-ehaft ie now placed and fitted at the head of the Concentrator, clear of the helt and in direct view of the operator or attendant. Thie, of couree, greatly facilitatee the oiling of the bearinge of the ehaft and connecting rod and precludes the poeeibility of any eand or detritue, paeeing over the helt, from reaching or getting into the bearinge.

The forme of the hearinge and ae well of the connecting-rod braeeee have alee been very much improved, making them etronger, eimpler and more eaey of adjuetment. Important changee have aleo heen made in the feed ecrew and quadrant for regulating the helt, with the view of making all parte of the machine etronger, more acceeeible and ae easy of regulation ae ie poeeible.

We furnieh the "TRIUMPH" Concentratore with either the plain or "Blaedel" Riffled Belt and eball be pleased to quote prices with the adaptation of either, ae may be requested, and eball further be pleased to ebow one of the improved form, eet up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

Joehua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentiemen:—Following the teetimonial letter which I addressed to you December 9th, 1890, in relation to the euperlority of the "Triumph" Concentratore over either the "Frue" Vannere or "Woodbury" Concentratore for concentrating our Texae oree, I hold now to the opinion then expreeeed; and with nearly two yeare and a half further experience in their opeiation I can confidently aeeert and am more fully convinced than then, that the "Triumph" Concentratore are hetter in all reepects than any other form for concentrating our Texae and Bully Choop oree, and in evidence of euch confidence I refer with pleaeure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) etamp mill at the "Cleveland Conealidated Mining Co.'e mines in Bully Choop Mining District in Shasta and Trinity Countiee, thie State, and I feel aeeured that the improvemente lately introduced into their conetruction will make them even better than the old form which I have had in operation for eo many yeare paet in the different mille under my eupervelon. I am, very truly,

(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cone. Mining Co'e.

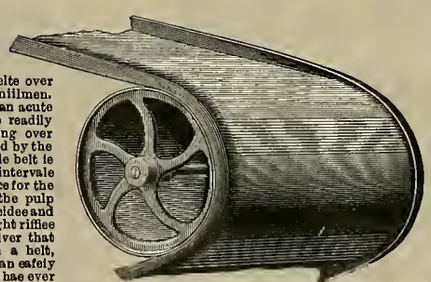
MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorbies Act, paeeed hy the State Legielature and approved March 8, 1893. The law ie entitled "An Act to Eetablish a Uniform Syetem of Mine Bell Signale to Be Ueed in All Mines Operat d in the State of California, for the Protection of Minere." We can furnieh theee Signale and Rulee, printed on cloth, eo ae to withetand dampneee, for 50 cente a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francieco.

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francieco. We keep alwaye on hand Belte euitable for the Triumph and Frue machines, but can make any length or width desired. The advantagee of theee belte over *any others* will be readily eeen by practical millmen.

First, the flanges or edgee of our belt etand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while paeeing over the end rollere; thus the vexation and loee caused by the frequent breaking of the flangee of the old etyle belt ie practically done away with. Again, our belte, at intervale of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevente it from hanking on the eidee and orming channele through the center. These elight riffles alee eave very fine eulphurete and the quickeilver that would otherwiee escape with the tailinge from a helt, the eurface of wblch ie entirely emooth. We can eafely eay that it is a better concentrator belt than hae ever been manufactured. It will last much longer and will handle more pulp. We also manufacture emooth belts with eameiflangee when deeired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

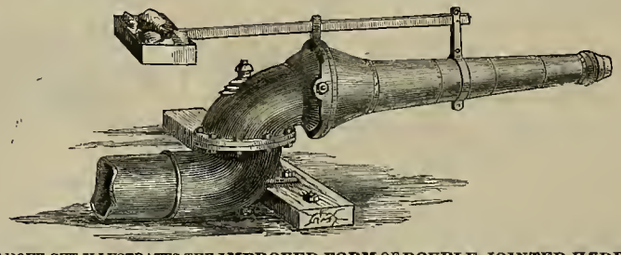
IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED etyle. The latter, however, we furnish when requeeted. Pricee, diecounte and Catalogues of our epecialtiee of Hydraulic Mining Machinery eent upon application.

JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

Coast Industrial Notes.

THE entire civil engineering department of the Union Pacific road has been dispensed with.

THE Imperial Paint Works at Spencerville, Nevada county, have started up. Eighteen men are employed.

THE Butte Irrigation and Land Company will issue $1,000,000 bonds for the purpose of building an irrigating canal and purchasing lands.

THREE HUNDRED coopers have been thrown out of employment in this city. Eastern competition and depression in business are the causes.

IT is proposed to do $147,729 49 worth of work in reclamation district 551, Sacramento county. In district 535, plans are for the expenditure of $50,000.

WORK is to commence at once in Los Angeles on the proposed new roller mill. It is expected to be finished by January 1, 1894, and the cost will be $100,000.

THE orange shipments from Southern California for the past season aggregate 6600 cases, which is about 2000 more than any previous season. Growers have realized less than in any former year. Co-operative associations are preparing to handle the crop of 1894.

THE South Gila Canal Company, Arizona, is constructing, ten miles from Sentinel, a very large dam. It is to be 106 feet wide at the bottom, 1400 feet long, 50 feet high and 13 feet wide at the top. The wall will be almost solid masonry. The work will be finished in two years.

CAPTAIN S. R. SMITH, of Portland, Or., has been awarded the government contract for construction of the jetty at the mouth of San Diego harbor. He is making preparations to begin work. Over 100 men will be employed. His bids were $1.62½ cents per ton for rock work, $12 per cord for brush, and for building 2000 feet of trestle and track his bid was $5.90.

WORK on the new line of the Southern Pacific, under construction from Santa Margarita to San Luis Obispo has been partly suspended by the Pacific Improvement Company and 1000 men are out of work. The construction of seven tunnels was under way, and 500 men only are left. The contracts call for an expenditure of over $1,000,000. Inability to place bonds for the prosecution of the work is the cause of retrenchment.

STARBIRD & GOLDSTONE, wholesale and retail lumber dealers, and owners of 10,000 to 12,000 acres of timber land in the northern part of the State, have assigned to E. J. Holt of the Simpson Lumber Company. Two mills were operated by the firm, Edgewood sawmill, at Sissons, 25,000 feet daily capacity, employing 40 men, and the El Dorado mill Diamond Springs, El Dorado county, 35 000 feet per day Assets are given at $148,000; liabilities, $108,000.

PRELIMINARY arrangements are being made for the construction of an electric road from Nevada City to Marysville, via Grass Valley. The storage system will probably be adopted. It is urged by the promoters of the undertaking that they can land freight from San Francisco to Nevada City for $6 per ton; that the passenger rate from Nevada City will be about $2 less than now charged; that the time of going to San Francisco will be lessened two or three hours.

THE combined efforts of thirteen tugs to raise the wrecked steamer San Pedro from Brotchy ledge, Victoria harbor, have failed. One hundred and twenty tons of water were pumped out of the vessel each minute for fourteen hours, and as fast as the water went out new leaks appeared. Captain Latchlair of New York, under whose supervision the work was carried on, now abandons all hope of getting the vessel off. He says the iron bottom is rusty and several new leaks have appeared. Over $200,000 has been expended in trying to raise the San Pedro.

TUBBS' HOTEL, the dig caravansary on Twelfth street, between Fourth and Fifth avenues, Oakland, burned to the ground Monday night. The loss was about $200,000; insurance $25,000. The hotel was one of the landmarks of Oakland. It occupied an entire 300-foot block. Its side extension was 260 feet and its front 225 feet. The structure was built in 1870 by Hiram Tubbs, of the Tubbs Cordage Company. It was for some years a favorite rendezvous of mining men, and during flush times was the scene of many brilliant gatherings of notable people. The place had been unprofitable for some years. There is no talk of rebuilding.

THE S. P. Taylor Paper Company of San Francisco suspended payment Monday, carrying down with it the Pioneer Paper Mill Company of Taylorville, a collateral concern. The liabilities of both companies are $190,000, and the assets said to be above $400,000. Ludwig Schwabacher, general manager of the Crown Paper Company, has been chosen trustee. He says the companies are solvent and will pay dollar for dollar if given time. The paper business is just now suffering from general depression. Other mills shut down are: South Coast mill, Soquel, Santa Cruz county; Corralitos mill, near Watsonville, Santa Cruz county; California paper mill at Stockton; Crown mill at Oregon City, Oregon; Puget Sound pulp and paper mill at Lowell, Wash. Some of these are expected to resume within a week or two.

BOTH the Columbia river and Alaska salmon packs are smaller this year than last. The Elmore-Sanborn Company's circular, just issued, gives the salmon pack for 1893 at 375,000 cases of all grades, or about equal to that of 1891, and 90,000 cases short of last year. The pack is distributed as follows: Aberdeen, 30,000; American Star, 9000; McGowan's, 12,000; North Shore, 10,500; Pillar Rock, 13,500; Megler, 14,000; Warren "Cathlamet," 11,000; Ocean, 7500; Eureka, 20,000; Hapgood, 12,000; Hume, 8000; Elmore, 18,000; Cutting, 15,200; Kinney, 42,000; Booth, 19,000; George & Barker, 14,000; Hawthorn, 21,000; Fishermen's, 15,000; Cook, 8000; Warren "Cascades," 35,000; Buccheit, 13,000; The Dalles, 18,000; total, 375,000. There will not be a single unsold can for the season. The Skeena river pack is given at 60,000, against 90,000 last year.

EX-GOVERNOR THOMAS, chairman of the National Executive Committee, has issued the formal call for the meeting of the International Irrigation Congress in Los Angeles, Cal., during the week commencing October 10th next. The membership in the Congress will be two delegates from each congressional district, and four delegates at large appointed by the Governor, two appointed by each county court, two from every university and college, two from each chamber of commerce, two for every hundred members of every agricultural or horticultural association, one from each irrigating corporation, mayors of cities of 2500 or more population, officers of State agricultural or other industrial schools, all governors of States and Territories, members of Congress, members of the American Society of Irrigation, engineers, delegates and irrigation engineers from foreign countries.

THE board of survey recently appointed to investigate the cost of repairing and refitting the old flagship Hartford, has completed its labors, and the report has been forwarded to Washington. The estimates cover an outlay of $600,0000, which is distributed through the various departments as follows: Steam engineering department, for new engines, boilers, pumps, auxiliary machinery, etc., $250,000; construction department, for rebuilding ship from water lines up, new decks throughout, including new spar decks, bulkhead, cooperage, spars, new boats throughout, refitting and building staterooms, wardroom, steerage, junior officers' rooms and messrooms, and new furniture and fixings for all the messes throughout the ship, $75,000. The shipfitters estimate that it will require between $60,000 and $70,000 for blacksmith work, new coal bunkers and brass finishings. The shipwrights say that it will take $175,000 to complete their portion of the work as required by the board. Added to this is an estimate of about $10,000 for a new steam steering apparatus and its adjuncts.

JOHN H. DAWSON, Federal Sugar Inspector, has forwarded to the Treasury Department his estimate of the yield of California beet sugar for the season of 1893-4. It is 42,000,000 pounds, distributed as follows: Chino district, 18,000,000 pounds; Watsonville district, 20,000,000, and the Alvarado district, 4,000,000. The advance estimates last year were: Chino, 11,000,000 pounds; Watsonville, 14,000,000 pounds, and Alvarado, 3,000,000 pounds, or a total of 28,000,000 pounds. The actual yield, however, was a good deal less. Watsonville produced 11,390,921 pounds, Chino 7,903,541 pounds and Alvarado 2,506,860 pounds, a total of 21,801,322 pounds. The bounty on this yield amounted to $436,026.44. Should the yield for the present year come up to the estimates the bounty would amount to $840,000. But if the yield is in the same ratio with the advance estimates as the yield of last year the production will only be 33,600,000 pounds, on which the bounty will be $672,000. So, after making allowance for every possible contingency, California will produce 11,800,000 pounds of sugar more than last year and receive $236,000 more of Federal bounty on the same.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

IN THE PIONEER DISTRICT.—*Record*, Aug. 12: The shaft of the Irma mine is sunk in the bed of Pioneer creek and is down 210 feet from the surface. The hills on either side, north and south, rise quite abruptly, so that extensive hacks are to be had even at this shallow depth from the surface in the bed of the creek. On the 100-foot level, two drifts have been run north and south from the incline on the line of the ledge a distance of 130 feet each way, showing first-class milling ore all the way. As yet they have not yet reached the end of the pay shoot in either direction. Crosscuts have also been run quite a distance, which show three or four parallel ledges of considerable promise. These are likely to unite with the main ledge as greater depth is attained. On the 200 level a drift has been run 150 feet from the incline, which shows the same class of high-grade ore as in the drift above. The rock now being crushed in Gracey's mill all comes from the 100 level. Prospecting is going on all along Pioneer creek and the adjacent hills from Mece's ranch, a mile and a half above the Irma mine, to a point quite a distance below that claim. Among the claims being prospected we note the Mace mine, located on the ranch, the Nichols & Fredericks mine and the Zumalt claim. Sheriff Gregory and Manager Shea, of the Irma, are also owners of a claim that gives great promise. N. M. Bowman, an old resident, is running a tunnel on the latter claim and is now in 150 feet. Mr. Bowman says the prospects are glorious, and he is confident that Sheriff Gregory and Mr. Shea will each realize a fortune from it. Below the Irma mine Milton Bearce is extending a tunnel on ground owned by Charles Gracey, which has already tapped some promising stringers of high-grade ore. There is a good supply of water and an abundance of timber at hand for use in the mines. There are two sawmills in the neighborhood, one owned by Mr. Mace of Ione, and the other under the management of T. Batchler. There are two boarding houses in the camp.

RESUMED OPERATIONS.—*Record*, Aug. 12: The Quartz Mountain mine was idle several months, but lately several men have been put to work in the mine, and it looks as though the company intended to resume operations in good earnest.

BELMONT WILL START UP.—*Record*, Aug. 12: Superintendent Tibbits, on behalf of the Belmont mine, has issued a notice to contractors for cleaning out the Boss shaft and extending the north drift 225 feet. It will take about six men to perform the work. Specifications can be seen at Dennis' drugstore.

THE CLINTON.—*Ledger*, Aug. 11: The Clinton Consolidated people have either paid off the attachments against that company or have given bonds to do so, and development work is going on at the present time.

THE AMADOR.—The English owners of the Amador gold mine have settled with the Pacific Bank by giving that institution a mortgage on the property for $20,000, and they have bought up all the judgments standing against the concern. The ownership of all the judgments prevents the redemption of the property by any one claiming adversely to the Englishmen; hence they expect to get a sheriff's deed to the property at the end of 60 days from the time they redeemed the Darling execution. The Americans are in possession of the property and still keep an armed guard employed to protect it against intruders.

BAY STATE.—At the stockholders' annual meeting of the Bay State M. & D. Company, held in Plymouth on Monday night, Aug. 7th, the following directors were elected: J. F. Parks, president; W. A. Green, vice-president; W. T. Jones, superintendent; Wash Marion, L. G. Griffiths, G. W. Easton, J. Graham; Bank of California, treasurer; A. J. Coster, secretary. Great interest was shown by the stockholders in this meeting as evidenced by the few shares not represented. The superintendent reports the water decreasing daily, and that it is now handled exclusively by the pump at reduced speed.

Butte.

IMPORTANT DEAL.—Oroville *Mercury*, Aug. 12: We learn to-day of an important mining deal, which will undoubtedly result in the opening of another big mine in this vicinity. The old Spring Valley quartz mine, located near Cherokee, has been bonded, through the agency of C. C. Belding, to W. H. Rodda, the extensive mining operator, for an English company of capitalists. The mine is owned by J. G. Nesbit of Oregon City. It has an old ten-stamp mill on it, but it has not been operated for some years, owing to lack of means. It is a well-defined, rich lode and only requires capital to make it a great gold-producer. We understand that Mr. Rodda's company will at once commence active work.

ACTIVITY ON THE HILLS.—Oroville *Mercury*, Aug. 11: Supt. G. H. Stout has returned from a three-weeks outing in Philbrook valley, Coon valley and other places in that neighborhood. Mr. Stout also noticed great activity in the mines all through the hills. In Brown's Ravine, Philbrook and in all localities there are many prospectors and paying mines. The Reece mine is one of the best gold-producers in the county, and the owners have a veritable bonanza. It is easily worked, is drained through a tunnel, and about 24 carloads of gravel are washed each day. The results from these 24 carloads net from $150 to $200 a day, the partners doing nearly all their own work. In other mines the outlook is equally as promising.

NEW HOISTING WORKS.—Angels *Echo*: New hoisting works are now being erected on the Blair Consolidated mine, situated on Smith's Flat, some two miles west of this town. The mine is the property of Smadske & Company, who bought it two years ago, and have been working it ever since. The main shaft is not more than 90 feet deep, and yet the lode is over four feet wide and getting wider as depth is attained. The ore is worked in a ten-stamp mill, and the yield is entirely satisfactory. From present indications, this mine, when thoroughly developed, will be a valuable property.

Modoc.

A GOLD STRIKE.—Adin *Argus*, Aug. 10: A very rich gold discovery, about 30 miles from Sisson, in the Eddy mountain, has caused much excitement. The hills are full of prospectors and every inch of ground in the neighborhood is located. The owners of the original strike were poor men, but have abstracted in the neighborhood of $10,000 in gold from the quartz taken out.

AT HAYDEN HILL.—Adin *Argus*, Aug. 10: We are reliably informed that the Golden Eagle and Blue Bell mines, at Hayden Hill, will soon be transferred to a company having capital, and that extensive operations will undoubtedly be commenced for the rapid and thorough development of these two mines. The mines there have been paying well lately, and from present indications they will yet produce the yellow metal abundantly. Gold, now, is not obtained near the surface, as it was 15 years ago, and more capital is required to properly and profitably conduct the mining.

Nevada.

WORK ON THE HOME.—Nevada *Transcript*, Aug. 11: Yesterday morning Charles Stepp and John Fischer, of San Francisco, two of the largest owners in the Home quartz mine, arrived in this city for the purpose of completing arrangements to work the mine on as large a scale as it is possible to do. Stephen Moore, a first-class quartz miner, is in charge of the mine. Men are now rushing the preliminary work, and the grading and foundation for the new hoisting works is about completed and the building will be erected immediately. It is the intention of the new company to put on all the men that can be worked to advantage right from the start, increasing the force as room is made for more men, and we would not be surprised to learn within 60 or 90 days that they have a big crew of men employed there. The Home is considered a good mine by those who are posted regarding the work that was done there many years ago. It is situated on Deer creek, just below the Champion mine, but the hoisting works are to be erected on the opposite side of the creek, below the Providence. Years ago this mine was owned by Thomas Findley, the Grass Valley banker. Some very fine rock was taken out, equalling in richness any of the quartz ever found in the Nevada City mine. It is now in the hands of just the right kind of men that are most desirable in this district. They believe in working the mine on a big scale, and have the coin to carry out their plans.

MINE BONDED.—Grass Valley *Union*, Aug. 12: The Belle Fountain mine, located at Willow Valley, above Nevada City, has been bonded to a number of capitalists at a very satisfactory figure, and the first payment has been made. The mine is said to be a good prospect. The principal owners of the mine are County Treasurer Snell, W. H. Smith & Son of Nevada City, and F. J. Thomas of Grass Valley.

WILL ORGANIZE A COMPANY.—*Telegraph*, Aug. 11: To-day Isador Hees sold his stock in the W. Y. O. D. Mining Company, and will begin immediately to organize a company to work the Coe mine. Mr. Haas has been an owner in the Coe mine for years and has spent considerable money toward its development; and he, like many others, has unbounded faith in the richness of that property, which has scarcely been touched yet.

A NEW MINE.—Nevada *Herald*: Things are moving along nicely now at the Reward mine. The incline shaft, which hes two compartments, is down 150 feet, and when it reaches a depth of 200 feet a level will be made and drifts run north and south on the ledge. The ground is very soft and requires skillful work. Three shifts of two men each are employed, and the work will be prosecuted every day in the week until they get into better ground. The incline was started on the croppings of the ledge, which were then two inches wide, and at the present depth of 150 feet the formation is 22 inches wide. The rock shows but little free gold, but plenty of sulphurets, and it has paid all the way from $19 to $40 per ton in various places where it has been worked before. The new hoisting works are fitted up with a fine steam plant; a horizontal hoiler capable of 45-horse power, with separate engines for pumping and hoisting, the latter being a small Atlas (Indiana) engine which develops great power. The reel is something new in this district and has a paper friction clutch and a simple yet effective eccentric, which is quite an improvement on the old-fashioned sliding gear. About ten men are employed, with Jos. Thomas as superintendent and A. H. Walrath as engineer. They expect to be able to sink 1500 feet with their present plant. Jos. Thomas, R. C. Walrath, B. J. Watson and S. K. Thornton, of San Francisco, are the principal owners in the Reward, and they hope to make the property worthy of its name at an early date.

THE OUTLOOK GOOD. — *Transcript*, Aug. 14: The new hoisting works at the Champion mine are completed and were set in operation yesterday. The machinery works very smoothly and everything about the plant, which is now one of the largest in the county, is most satisfactory. The mine is looking as well, if not better, than it ever did, and very rich rock is being taken out. At the Providence the outlook was never brighter and work is being

carried ahead with a vim that shows that the present management means business. Excellent rock is now coming from this mins, and the mill is kept running steadily. Some fins rock was bronght in to-day from the Belle Fountaine mine at Willow Valley. This mine will nndoubtedly develop into a paying property as soon as it is worked on a big scale. This is the mine that was bonded a short time ago. At the other mines hereabonts the prospects are highly encouraging, and it is the opinion of mining men who are acqnainted with the present situation that the clean-ups for the ensning months will exceed in richness any made here in many years before. The bullion ontpnt of this district for last month was larger than for a long time, and was a surprise to all interested, bnt the coming month's yield of onr mines will, it is believed, be considerably larger.

GAAVEL MINAS.—*Tidings*, Ang. 4: The gravel mines in this district are now coming to the front in a manner that is not only highly pleasing to the stockholders, but to everybody who has an interest in Nevada City's prosperity, says the *Transcript*. The drift mines on the Washington ridge, above town, are now showing what they are capable of doing after the proper development work has been doue. Wednesday afternoon the Original Harmony made a clean-up of nearly $4000, which assures the payment of all their heavy expenses and a dividend of about $1500. The company are now working in the richest gravel ever discovered in the mine, and indications point to the fact that the same rich gravel rnns throngh their entire property. If this he so, and it will scarcely admit of a donbt, then it is fully demonstrated that an unexpected new era has dawned npon the people in this section. The same lead has been struck up near the Central House, a distance of 11 or 12 miles from Nevada City, and the gravel and gold are identical with those of the Harmony, thns confirming the opinion so often expressed by gravel miners, that the channel extended up the ridge for many miles. Between these mines there are two very large claims, which are owned by Hon. W. W. Stow of San Francisco, and it is said that the development made in the Lupin mine, near the Central Honse, in which section the Centennial and San Jose gravel mines are also located, gives Mr. Stow sufficient knowledge of the country to believe there are millions of dollars in his property which as yet nothing has been done npon, and he will go ahead and open up these mines. It can be safely said that when all the mines on the ridge leading to Washington are in full operation, employment conld be given to five or ten thousand men. There is no place in the world where there is so mnch unworked good gravel-mining ground as in this vicinity, and when it is all opened np, Nevada City, on account of thia great outpnt of gold, will become as famons as any goldfield ever discovered. The West Harmony, which adjoins the Original Harmony, is now in very rich gravel, and the clean-up made there Wednesday was one of the very best they have ever had. The people here rejoice that such is the case, for the reason that the largest interest in this mine is owned by Hon. W. W. Stow, to whom great credit is due for the opening np and demonstrating, with his coin, that we have in this district gravel miues that will justify the large expenditnre required. Mr. Stow, acting npon the advice of a few prominent citizens of this place, became interested in the gravel-mining industry in this section, and, with his well-known good judgment and indomitable will, has invested his money here when other men of means turned a deaf ear to all the representations and propositions made to them. We feel confident that in a short time we will be able to chronicle as a fact that the Odiu, Manzanita, Yosemite and a nnmber of other companies on that divide have struck equally as good gravel as that now seen in the Harmony. The prospects in these mines at the present time are very flattering.

Placer.

STAATING UP THE WASKE.—Placer *Herald*, Aug. 12: The Turkey Hill drift mine, near Michigan Blnff, is being pnmped ont with the view of working it again. This, generally known as the Weske claim, has yielded big money in its time, and those best posted are of the opinion that it contains a great deal more. Messrs. Weske, Hayward and Brown are back of the enterprise, and it is hoped their best expectations will be realized.

Plumas.

LOOKINO WALL.—Nevada *Transcript*, Ang. 11: The Johnsonville mines in Plumas county are looking up. At the Jamison mine 30 men are employed. The Squirrel Creek mines are doing well. Dnring the three months the Forest gravel mine, by gronnd slnicing, cleaned np $3000 with three men employed. The product was nearly all coarse gold, the heaviest piece weighing five ounces. At the Snnny Side mine, on the line between Plnmas and Sierra connties, drifting is in progress on a channel. Prior to 1891 a break from thia channel was operated as a hydraulic mine and yielded up to that time $75.000, and that at an expense of only $9000. Some astonishingly large nuggets were secured, the largest weighing $3270; another, $1800; another $1000, and several as large as $500.

Shasta.

NAW MINERAL BELT.—Shasta *Democrat*, Ang. 11: Lem Williams, of Copper City, was in town Monday and brought the news of the discovery of a new mineral belt. The camp is on Canyon creek, some 9 or 10 miles northeast of Pootem creek, where Ezra Thomas discovered the copper mines he sold to the Sacramento company. Several miners from Copper City have located claims on Canyon creek. The croppings show the ore is bsse but rich in silver, gold and copper. The discoverers of this new camp say the ledges are very large and extensive, with an abundance of living water power and mining timber, but the country is very rugged.

Siskiyou.

GOLD-BEARING LADGE.—Yreka *Journal*, Aug. 16: C. H. and Ed Jordan have discovered a fine ledge of gold-bearing quartz on Sucker creek, a tributary of Hnmbug, jnst above the forks, specimens of which show gold to the naked eye. At the croppings on the snrface the ledge is about six inches wide, but in digging down a short distance it is 14 inches wide. They intend prospecting it very thoroughly, with a firm belief of realizing a rich reward for their labor and expense. Parties from below are now examining the old Spencer quartz mine on Humbng creek, with a view of deciding how to work it, whether to pump ont the old ahaft or run a tnnnel. The mine is well sitnated for development by tunneling, bnt, of conrse, considerable money is needed to drill and blast before the ledge is reached. The advantage of a tnnnel affords natural drainage, and the quartz can be hanled out in cars to the mill. The drainage from the tunnel wonld be available for a steam mill and the batteries, or wonld rnn the mill by gaining hydranlic pressure. The Greenhorn blue gravel mine prospected exceedingly rich dnring two days of last week, six onnces being realized on one day and eight on another. The belt of the hoisting machinery was then broken, reqniring new belting from below. At present the men are cntting throngh rim rock between two rich cbannel beds, which, being removed, will permit easier working of the gravel beds. The water snpply is rather light, bnt, when winter sets in, the company will be able to double the force and take out from the two channels at least $100 a day. A correspondent writes ns that J. A. McCall, who has been prospecting during the past four years in the East Fork mining district on the divide between Shasta and Scott valley, near the wagon-road from Gazelle to Callahan's, has at last struck a bonanza. It is a chrome ledge about ten feet wide, and crops out above the ground between three and four miles in length. The ledge runs nearly due north and sonth. Davis & Co., in the same locality, have also run a tunnel 270 feet on their qnartz ledge, with indications of soon striking rich ore containing both gold and silver. This claim is abont a mile from the Gazelle and Callahan's wagon-road. The Scott Valley *News* says the pipe for the power plant of the Meyer's cannon-ball mill was shipped to Shackleford creek last Wednesday. Supt. J. M. Luttrell, of the Pacific mine, at Indian creek in this county, in which he is interested with U. S. Senator Perkins and his partner Goodall, informs the Scott Valley *News* that a 4½-foot ledge had been strnck. Luttrell has been working the mine for the past year or more, and we are glad to hear he has found a good-sized ledge, which we hope may turn out rich.

Trinity.

LARGE LEDGE. — Trinity *Journal*: From Johnny Tompkins, one of the owners, we learn that the Silver Grey qnartz mine, in the Canyon Creek mining district, is lookiug well and promises to develop into a good paying property. For some time the owners have been running a cnt with which they recently tapped the ledge at a depth of 1000 feet. The ledge is four feet wide, and from a crushing of 100 tons of ore the result was more than the owners anticipated.

AT THA WARU.—*Journal*: Our reporter paid a visit to the Ward miue last Sunday. This property was recently purchased by a syndicate of Colorado and French capitalists. The old company has made great headway since our last visit. The mine is now thoroughly opened, and can be worked to a better advantage than formerly. A commodious two-story boarding-house is also amoug the improvements made dnring the last year. A great amonnt of gravel has been washed this season, and an extra good clean-up is anticipated.

Tuolumne.

DOWN 190 FEET.—Sonora *Banner*, Ang. 11: The shaft in the Cardinelle mine at Tuttletown is now down 190 feet. The formationa at this depth are such, it is said, as to indicate that a rich pocket may be strnck at auy time. Just now the company is encountering a heavy flow of water, which retards the work to a considerable extent. This tronble will soon be mastered and the work in the shaft pushed rapidly forward. . . The new 10-stamp mill at the Keltz mine has been completed. The mill has now 20 stamps in operation.

REOPENINO AN OLD MINE.—Sonora *Banner*: P. P. Hnnter and others have secured the lease of a mine at Algerine, bnilt a substantial whim, and are sinking a shaft with flattering prospects. The mine is said to have been rich in days past, and it is believed that the vein will show some big pockets in the near future.

A SMALL FINU.—Columbia cor. *Independent*: Messrs. Peterson and Keefe have strnck it again in the "Never Sweat." This time the little dab amounted to $1600. The less fortunate brother miners on the western extension, the "Alwaya Sweat," have not struck the combination yet.

NEVADA.

Washoe District.

CON, CAL. & VA. MINE.—Virginia *Chronicle*, Aug. 12: 1500 level—The upraise started in the main south drift on the sill floor of thia level, at a point 256 feet distant from the main ahaft, has been carried np 21 feet in clay and qnartz which showa a low assay valne. 1600 level—The sonth drift started at the end of the east crosscut rnn east from the main south drift at a point where it connecta with the npraise carried up to the north drift on the 1500 level, has been extended 15 feet; total length 39 feet; continuing in porphyry and qnartz of a very low assay value. Have continued the work of bulkheading and closing the openings which connect with the old stopes in the north end of the mine where gas exists, and the escape of the gas is growing less. 1650 level—Have resnmed work on the north and south sides of the drift rnn east (at a point 20 feet down) from the winze sunk from the crosscnt run west from the main northwest drift; also upward at the end of tbe drift run south from that winze at a point 52 feet down, and have extracted from all these places during the week 325 carloads of ore—abont 320 tons. Have ahipped to Morgan mill during the week 439 1040-2000 tons of ore, the average assay value of which (per car samples) waa $38.89 per ton. The average assay valne (per battery samples) of all the ore worked at the mill during the week (350 tons) was $32.68 per ton.

OPHIR.—1565 level—The east crosscut started from the main drift on the sill floor of this level, at a point 108 feet sonth from the winze station, has been advanced 15 feet; total length, 24 feet; in a hard porphyry formation.

MEXICAN. — 1565 level — The east crosscut from the north drift from the crosscnt rnn east from the bottom of the winze, has been extended 25 feet; total length, 179 feet, in a porphyry, clay and quartz formation showing a little value.

SIERRA NEVADA.—The intermediate tunnel on Cedar Hill has been advanced during the week 12 feet, making the total length 527 feet; the face is in porphyry. The north drift started at a point 1520 feet west of the joint Sierra Nevada and Union shaft on the 900 level, is ont a total distance of 52 feet; face in clay and porphyry.

UNION SHAFT.—The north drift started on 900 level, at a point 1520 feet west of shaft, has been advanced 52 feet; face in clay and porphyry.

ANDES.—On 420 level east crosscut from main lateral drift, north, was advanced 12 feet; total length, 36 feet; face in porphyry, clay and seams of quartz.

GOULU & CURAY.—200 level—West crosscut No. 5, started in northwest drift, 432 feet from main west drift, has been advanced 14 feet; face in hard porphyry; total length, 571 feet. At a point it west crosscut No. 5, 60 feet from northwest drift, started a northwest on a stringer of quartz and advanced same 8 feet.

BEST & BELCHER.—200 level—East crosscnt No. 2, started in northwest drift, 295 feet from our south boundary, has been extended 25 feet, passing throngh soft porphyry; total length 45 feet. 900 level—West crosscut No. 5, started in sonthwest drift, 100 feet from west crosscnt No. 4, has been advanced 16 feet; total length, 62 feet; face in porphyry.

HALA & NORCROSS.—On 900 level the west crossut No. 1 from south drift was advanced 22 feet; total length, 32 feet; face in clay and porphyry. 1100 level—Have advanced No. 1 west crosscut from the sonth drift on this level 28 feet; total length, 38 feet; face in porphyry.

CHOLLAR.—Are retimbering the main tunnel on 250 level and repairing the main incline below the 930 level. Have started a drift north from the west crosscut, 930 level, which is now ont 16 feet; face is in porphyry and clay.

POTOSI.—The sonth drift, 35 feet west of the main shaft on the 850 level, is out 24 feet; face is in soft porphyry. The east drift, 73 feet above the 930 level, to connect with north raise from 930 level, is ont 104 feet; face is in soft porphyry, showing streaka of qnartz. Have started a drift north from the top of raise from the 8th floor of south stope, 1000 level, which is ont 15 feet; the face shows porphpry and qnartz that gives fair assays. Extracted and sent to the mill the past week 297 tona and 1000 ponnds of ore from the 930, 1000 and 1150 levels. Milled dnring the week 320 tons. On hand at mill 100 tous and 1250 pounds. Average battery assays, $30.26; average car-sample assays, $35.58.

OCCIDENTAL.—From the west ledge on 300 and 400 levels we are extracting aud milling abont 5 tons of ore per day of the average valne of $32 per ton, as per car sample. Have milled during the week 60 tons of the average valne, as per battery samples, of $27 per ton.

KENTUCK.—Have extracted from the west ledge on the 1100 level about 20 tons of ore per day of the average valne, as per car samples, of $8 per ton in gold. The sonth drift from the joint east crosscut is in 24 feet; face in low-grade ore.

WAAU SHAFT. — The west drift from the station, 820 level, is out 52 feet from the shaft; face is in porphyry.

BULLION.—The west drift from the station, 820 level, Ward shaft, is ont 52 feet from the shaft; face is in porphyry.

EXCHEQUER.—The west drift from the station, 820 level, Ward shaft, is out 52 feet; face is in porphyry.

ALPHA.—The west drift from the station, 820 level, Ward shaft, is ont 52 feet from the shaft; face is in porphyry.

NAW YORK.—No work has been done in the mine dnring the past week.

Pioche District.

YUBA SHUTS DOWN.—Pioche *Record*, Aug. 9: Work at the Yuba mine will be snspended this evening. No ore has been extracted from the mine since the recent drop in silver, the workmen being engaged in timbering the shaft and drifting to connect with the Mazeppa shaft. The company has a force of men putting in order the works on No. 3 of the Meadow Valley group, preparatory to the resumption of work in the mine.

ARIZONA.

TWENTY-STAMP MILL.—*Journal-Miner*: Four mechanics from Fraser & Chalmer's Works in Chicago have arrived to erect a 20-stamp mill on the Henrietta mine (recently known as the Yankee Girl) in Big Bug district. The machinery is due to arrive this week, and will at once be shipped to its destination. A new and rich strike is reported to-day from ths Husted mine on the Hsssayampa made by Joe Goff. The ore assays $375 in gold and a 20-inch vein is the size. It is snlphnrets, and will be shipped.

IN NOATHEEN AAIZONA.—Prescott *Courier*: Northern Arizona has more good gold and silver mines than any similar area in the world. Mining of either of the metals, if properly prosecuted, will add many millions yearly to the world's wealth. We have many good gold mines and many good silver mines that only await the advent of capital for the one and favorable legislation and capital for the other to place onr Territory in the front rank as a producer of the precious metals. There are also within our borders some of the greatest copper-producers in the country, chief among them being the United Verde of this conuty and the Bisbee and Morenci mines of Cochise and Graham. The mining world is now looking for gold propositions, and of these we have enough to employ thousands of men in the districts of this county, of which Prescott is the central point.

AT WORK ON GOLU.—Prescott *Journal-Miner*: The slump in silver has seriously affected miniug operations in this section by causing a cessation of work in exclusive silver mines, as well as properties which prodnce both of the precious metals. But, while such is the case, it is very lucky that gold is the predominating metal, and that for nearly every silver mine that has closed down a gold property has been started to work. A list of the mills now in operation which have been erected recently, as well as others which are in process of constructiou, will surprise even those residing here who have not taken the trouble to count them. Those in operation are as follows: The Virginia gold mill at Yarnell, 10 stamps; the Kerr mill at Stanton, 10 stamps; the mill of A. T. Marsh at Minnehaha, 10 stamps; the Commercial Mining Company's mill on Big Bng, 10 stamps; the mill of the McCrnm Sampling and Ore Works at the Silver Belt, 10 stamps; Old Reliable, in Bradshaw mountains, 5 stamps; the Pratt mill, J. R. Ritchie, lessee, on Big Bug, 5 stamps; John S. Jones, in Chaparral, 5 stamps, to be iucreased soon to 15 stamps. A lease has been taken recently on the Wire Gold miue, near Squaw Peak, on which there is a 10-stamp mill, which will he started up soon. Mr. Burson has a Burson mill of 10 stamps capacity under process of construction on the Hassayampa. Dr. J. Miller is puttiug up a five-stamp mill on his Westlake mine, four miles south of town, which he expects to have in operation within the next 30 days, and, if it proves a success, the capacity will be doubled and probably trehled soon. The McCabe Mining and Milling Company has a portion of the machinery for a five-stamp mill now on the grouud and has men at work preparing to put it in place. This one is expected to start work within six weeks. Tbe Henrietta Mining Company, the recent purchasers of the Yankee Girl, and two other mines in Chaparral, have ordered a 20-stamp mill to he erected on thia property. Brown and Barrett have contracted for a five-stamp mill for their mine on Castle creek. The above is a list of those now in operation or already contracted for, while negotiations are now in progress for several other good gold properties, which, if cousummated, will reqnire the erection of additional mills.

OREGON.

BUYINO GOLU DUST. — Jacksonville *Times*, Aug. 11: Beekman & Reames' bank has been buying more gold dust this year tbau any during a long time. . . The Hope mine in Talent precinct, which belongs to G. S. Butler, I. W. Burriss, S. D. Taylor and others, as also two locations on extensions of the same, have been bonded to Gund & Edwards of Seattle, Wash., for $12,000. . . Work is steadily progressiug on the new tunnel of the Asbland mine, which will be 600 feet long when completed. Although the hardest rock is encountered, the Burleigh drill is moving ahead at the rate of five feet a day. . . Wimer Bros., who own extensive placer mines in Waldo district, have made a partial clean-up Our represeutative, while at Grant's Pass last week, saw two bags of gold, weighing nearly 40 pounds, which had been taken out so far. It was something handsome to look at. As this represents nearly $10,000, it will readily be seen that Messrs. Wimer will have a profitable season.

THA GLOBE LEUGE.—Rogue River *Courier*: Razee and Boynton are driving a 250-foot tunnel at the base of an old ahaft on Thompson creek, a tribntary of the Applegate. Some $30,000 had formerly been taken ont of the mine, but the property fell into litigation and so Razee and Boynton have purchased the claim and gone to work. Pay ore is being followed along the line of the new tunnel.

SALE OF THE LITTLA DAISY.—Ashland *Tidings*, Ang. 11: The sale of the Little Daisy miue, of Hammersly and sons, at the head of Jnm-off-Joe creek, to a company of Colorado and Idaho capitalists, was reported last Friday. The purchasers are J. M. Bnrke and T. D. Drew, and the price is said to be $40,000. Tbe mine is upon a lead of soft or decomposed quartz which varies in thickness from a few incbes to 14 inches, and yields from $50 to $1000 to the ton. It was located last fall, and the development consists of a 70-foot shaft, from which drifts have been run a total length of not over 60 feet. The new purchasers intend to put up a 10-stamp mill. Mr. Burke is a prominent Idaho miner, and ran for Governor of that Territory last year. . . A large number of men are at work in the Bohemia mining district near Cottage Grove. . . The new 5-stamp mill of the Lncky Bart mine on Sardine creek is expected to be started the last of this week. . . W. H. Hampton, the Portland assayer, was in Ashland last Saturday, and it was learned that he has bought the Dysert property of 514 acres, on Grave creek, 10 miles east of the railroad. The price was $8000. The

property consists of rich placer ground and also includes quartz ledges that prospect well. Mr. Hampton and those who will be interested with him, purpose the opening of a 10-mile ditch to work the placers, taking the water from Grave creek within the Jackson county boundary lines.

MONTANA.

NO SHUTDOWNS HERE.—Butte *Inter-Mountain*, Aug. 12: The week in mining circles has been uneventful, but this in itself is good news. There have not been any shutdowns or suspensions of operations, while in the copper-mining industry much new work is in progress. Two of the big mining companies disbursed over $100,000 in the channels of trade, and the coming week several of the other large concerns will have pay days. One week from to-day the Butte & Boston Company will pay off. The Heinze Company will also distribute about $20,000 the coming week. The following week the Anaconda pay days will roll around. The copper industry, together with the construction of the new railroad to Anaconda, has greatly relieved what might otherwise have proved a dull season. All the Anaconda, Butte & Boston, Boston & Montana, and Parrot mines are regularly producing ore. Train loads go to the smelters at Anaconda and Great Falls daily. The Butte & Boston company is working five mines, but only two—the Gray Rock and Silver Bow—are producing ore. This company secured the Comanche mine during the week, having purchased the lease held by Patrick Mullins. The lease extends to August, 1894, and the bond of $200,000 is due in October of this year. The Comanche is one of the most promising copper properties in the district. The Butte & Boston Company is actively engaged in developing the Comanche. It transpires that Mr. Mullins and his partners were paid $10,000 for the lease of the Gambetta. Mr. Leggatt receives 30 per cent royalty of the ore produced during the lease. Meantime, silver mining in Butte is stagnant. Not a bullion shipment has been recorded in weeks, and there is not likely to be any in some time. The Eveline mine is still producing ore, but inasmuch as the ore carries about $50 per ton in gold, the fortunate owners are not affected as seriously as the other mines of the county. The search for copper and gold in new or abandoned districts continues. West of this city there is considerable activity in developing copper properties. In some cases miners are working for their board, to be paid full back wages if the developments prove profitable. Everywhere are to be found miners prospecting for gold, and, while no bonanzas are being uncovered, the results show a material increase in the output of the yellow metal.

WASHINGTON.

THE MOYEA PLACERS.—Bonner's Ferry Special, Aug. 7: There is a good deal of excitement on account of the recent discoveries of gold on the Moyea river, 12 miles northwest of here. Three weeks ago John Hoban panned out a few shovelfuls of dirt and found 30 good-sized colors. He reported the matter in Bonner's Ferry, and there are now nearly 100 prospectors on the Moyea. Thus far the gold found is flake gold and has a fine color. It does not appear to have been washed very much. All the colors have been taken from surface gravel, but several shafts are being sunk. There is plenty of water, and the gravel is easily washed.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 11, 1893.

501,240.—WIRE FENCE STAY—G. S. Bartholomew, Gawanza, Cal.
501,400.—EXCAVATOR—H. P. Bennett, Phœnix, A. T.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 17, 1893.

The silver market during the week improved sharply, and a better feeling seems to be noticeable since the meeting of Congress. Curiously enough, one result of the President's message, which was exceedingly hostile to the silver interests, was to strengthen the market, both in London and New York, so that last Thursday in New York the quotation was 75¾ cents, an advance in one week of 4¾ cents. The improvement in London was 1¾ pence. Since then, something like former quietness has been resumed.

The prospect for silver appears to be much better than for some time. Previous to the meeting of Congress, it was assumed that the sentiment of the country was such that unconditional repeal of the Sherman law was inevitable. But it now appears certain that the silver men are going to be an important factor in determining the legislation of Congress and it may be that the Sherman law will not be repealed at all. If it is, a substitute of some kind recognizing silver will be enacted. It is consideration of these things that has recently given the silver market a much better tone.

Mining Share Market.

SAN FRANCISCO, August 17, 1893.

The mining share market has been quiet during the week, Comstocks showing much weakness. Offerings are small and mostly from chippers and speculating brokers who are shorting the market, hoping that it will drop a few cents and give them that much profit.

The mining expenses on the Comstock this month will be the smallest of any month in the last 30 years, owing to the cutting down of salaries, the discharge of miners along the lead and other curtailment. At no time in these last 30 years has there been such a small force of men employed in the mines. It now amounts to about 270 miners actually at work underground. It is reported that, should the miners decide not to accept a reduction of wages by the end of the month, there will be a further reduction in the force and several more of the mines are likely to suspend all operations.

The Savage mine did well last month and earned $150 more than its expenses. Chollar is one of the steadiest stocks on the list and is beginning to attract attention. The stock which showed the most weakness yesterday morning was Consolidated California and Virginia, which up to to-day has shown much strength. There was a decline to $1.25, and most of the other north-end stocks declined a little in sympathy.

The North Banner Mining Company of Nevada county has levied an assessment of two cents per share.

The Gold Flat Mining Company of Nevada county has levied an assessment of five cents per share.

The Planet drift gravel mine at Lowell Hill has been bonded to Charles H. Richardson, who will put ten men at work.

The Miners' mill at Bodie is being put in order for a run on ore from the Eva and Sunshine mines.

Another California gold-mining company—the Gray Eagle, of the Forest Hill Divide—made application yesterday morning to the San Francisco Stock and Exchange Board to have its stock listed.

The Hermit Mill and Mining Company of Mokelumne Hill has levied an assessment of 1½ cents per share, delinquent September 16th.

The delinquent sale of the Hale & Norcross Mining Company will be held on Friday this week, and there are still 65,000 shares of the 112,000 shares of capital stock on which the assessment of 50 cents per share has not been paid.

The Bodie *Miner* says the Bulwer did not have its regular pay day on the 5th of this month, but instead will pay on the 20th.

MINING SHAREHOLDERS' DIRECTORY.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LAWN SPRINKLER.—Thos. Scheen, Oakland. No. 502,641. Dated Aug. 1, 1893. In a former patent, No. 436,942, issued to the same inventor Sept. 23, 1890, a sprinkler was shown having a partially formed slot extending outwardly from the central opening of the sprinkler, and the present invention is an improvement upon the former device. The spray or sheet of water delivered from the discharge opening is in the form of a narrow sheet, and is especially applicable to the irrigation of narrow borders where it is undesirable to throw a large quantity of water upon paths or other points which it is not designed to irrigate.

CHURN.—Rose A. Ludlow, Globe, Tulare Co., assignor of two-thirds to L. C. F. Wynne and O. H. O. Wynne, of Hanford. No. 502,628. Dated August 8, 1893. The objects of this invention are to provide a churn which, by reason of the effective shaking imparted to the cream-containing vessel, will make the butter with certainty and in short time, and also, by reason of the adjustability of each vessel, will provide for proper positions at the several stages of the operation.

STATION INDICATOR.—Henry G. Krasky, S. F., assignor to U. S. Indicator Co. No. 502,625. Aug. 1, 1893. This is one of that class of exhibiting devices for railway care in which the indicator or exhibitor mechanism is operated by power transmitted through suitable connections from the axle. The device is intended to compensate and provide for any inaccuracy due to "slipping," by so constructing the power-transmitting connections from the axle that they shall be automatically thrown out of and into action at given times and points, and set initially at the beginning of each round trip.

FRICTIONAL MOTION-TRANSMITTER.—Wm. H. Masterman, Oakland, assignor of two-thirds to W. M. Rank and F. H. Meyers. No. 502,570. Dated Aug. 1, 1893. The object of the invention is to provide a mechanism whereby motion may be gradually communicated from a motor to the part to be driven, whereby the latter may be started without bringing too great a strain or injury on the driving parts. In the patent the invention is shown as applied to an electric motor, but it may be used equally well to transmit power in any machinery.

CALIFORNIA MACHINE WORKS,

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition of R. M Mooer and J. O. Boyd for permission to mine by the hydraulic process at the Kelly Hill Gold Gravel Mining property, situated in Butte County, in sections 27 and 28, Township 23, N., Range 3 East, and to deposit tailings in Neshit and Brewer Gulches, which discharge into Big Butte Creek, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 50, Flood Building, San Francisco, on August 29, 1893, at 1:30, P. M. On and before this hour and day all parties interested may file affidavits, plans and maps, in support of their respective claims. By order of the Commission; W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

NOTICE.—The California Debris Commission, duly appointed under the Act of Congress of March 1, 1893, having received a petition from N. C. Tully for permission to mine by the hydraulic process in the Omega Mining District, situated at the village of Omega, Washington Township, Nevada County, California, and to deposit tailings behind a dam in Scotchman's Creek, which discharges into the South Yuba River, and having also received a petition from Robert McMurray, attorney-in-fact for the Eureka Lake and Yuba Canal Company Consolidated, for permission to mine by the hydraulic process the Farrel mine, situated near Columbia Hill, Nevada County, California, and to deposit tailings behind a dam in an old hydraulic pit, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on September 4, 1893, at 1 o'clock P. M. On and before the hour and date, all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission; W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary.

More Currency a Necessity.

It is one of the anomalies of the present crisis that the bankers of Wall street are unanimous for more currency and less silver. They ask Congress to revise the banking laws in such manner that they may extend their circulation without adding one cent to their assets, and without putting up one cent to guarantee the additional issue. Their position is notable for its inconsistency. They have always opposed a greater increase of the circulating medium in silver, declaring that there was enough gold and silver for the business of the country. They feared inflation because of increase of silver coinage, and, when they could, opposed the freer circulation of silver certificates, which represent a money metal intrinsically valuable. Now they find their position untenable and they ask an increase of currency by removal of restrictions in the banking laws. If this is not a step toward what these bankers formerly called inflation, what is it? It has been demonstrated by experience that the circulating medium is insufficient in volume. All agree now on that proposition. But the banks say it should be increased by extension of their credit; the people by greater use of a money metal of intrinsic value. The banks ask increased privileges and greater power that the financial system of the country may be placed on a basis of gold on the one hand and credit—their credit—on the other. The people demand the basis be gold and silver equally on the one hand and their own credit on the other.

It ought to be plain that the nearer the country can approach a cash basis, the safer and sounder will be its business. The people are right.

THE bids for making a new mouth for the Yuba river near its present confluence with the Feather river were opened by Major W. H. Heuer of the United States Engineer Corps last week, and his recommendations in regard to the same have been sent to Washington. There were five bids. There was very small difference between the lowest, those of the California Construction Company and Wm. Elliott, Sr., of Gridley, the two being as follows in detail: Mr. Elliott's bid for the 236,000 cubic yards of earth was 17½ cents per cubic yard; for 1000 tons of rock, $6 per ton, and for 2500 cubic yards of brush, $1 per cubic yard. The California Construction Company's bid for 236,000 cubic yards of earth, 17¾ cents per cubic yard; for 1000 tons of rock, $3.40 per ton, and for 2500 yards of brush, $1 per cubic yard. The whole amount of the work calculated by these figures will cost over $48 000. The distance is 2500 feet. The canal will be 350 feet wide and 13 feet deep on an average.

THE question of miners' wages on the Comstock seems to be as far from settlement as ever. The miners are very firm in opposing reduction, and they say they are prepared to resist the attempt to the last. At a meeting of the Virginia City Miners' Union last Saturday night, the committee to which was referred the proposal of H. Zadig and C. H. Fish, that a reduction of 25 per cent be made, reported in favor of a conference being held with the mine superintendents to consider the matter. A resolution was unanimously passed that the suggestion of the committee be ignored and that no further attention be paid to the proposition. The Storey County Mechanics' Union took the same action as the Miners' Union on the wage question.

THE engineering congress recently held in Chicago was the most notable gathering of the kind in recent years. The attendance of members, foreign and native, was large, and the interest in proceedings general and continuous. There were seven divisions represented in the congress—civil engineering, mechanical engineering, mining engineering, metallurgical engineering, engineering education, military engineering and marine and naval engineering. Each division held a daily session for five days, occupying the entire morning, and on Saturday a joint final session was held to make an appropriate conclusion to the work of the week. All the great nations of the world and many of the smaller countries were represented by engineers of eminence who were earnest in their praises of the valuable opportunities they had enjoyed for exchanging views, learning lessons from the record of practice and experience, discussing results, and acquiring information on important subjects connected with their various professions.

"GRIZZLY GIANT"—ONE PRODUCT OF A MINING COUNTY.

Big Trees in a Mining County.

Mariposa is a California county that has contributed immensely to the mineral wealth of the State. The county is seamed with quartz veins and is penetrated by the Mother Lode. The run of ores yields from $10 to $15 per ton, though numerous pockets are struck here and there running up into the hundreds per ton. There are several fine veins of good marble in the county. Silver and copper are also found. In topography, the county resembles Amador, Calaveras and El Dorado, and it shares with Calaveras, Tuolumne, Fresno and others the possession of the marvelous sequoia forests which have made that region famous. Besides, the world-famed Yosemite valley is in the northern part of the county, so that it has altogether better known scenic attractions than any other part of the State.

The sequoias—a type of which is chosen as subject of illustration—are mammoths among trees, the Methusalehs of the forest. The sequoia timber belt along the Sierras extends from Calaveras on the north to near the head of Deer creek on the south, about 200 miles. The sequoias are natives of California and are never seen outside this belt. They seem almost imperishable. No known trees in the world compare with them and their kin, the redwoods, for gigantic size. A tree from 300 to 400 feet high, 30 feet thick in the trunk is a great curiosity, and yet there are a number of such. In the Calaveras Big Tree grove there are 150 trees more than 15 feet in diameter and ten about 30 feet. One of the fallen monarchs must have been 450 feet high and 40 feet in diameter. The "horseback ride," as it is called," one of the wonders of the grove, is a hollow trunk through which a man can ride upright on horseback 75 feet, and theatrical performances have been given in it.

The State grove, in Mariposa county, is 15 miles south of Yosemite, and has 427 trees, including 134 over 15 feet in diameter, 18 over 25 feet, and three over 33 feet. A daily stage coach has been driven through one, 120 children and a piano crowded into another. A single tree would furnish two-rail fencing 20 to 30 miles. The cut on this page shows admirably the immensity of the trees.

THE New Grand Victory Gold Mining Co. was recently incorporated. Directors—M. Thomson, W. C. Stratton, T. Clark, S. B. Clark and J. Gordon.

MINING AND SCIENTIFIC PRESS.

BY THE DEWEY PUBLISHING CO.

Office, 220 *Market Street, Northeast corner Front, San Francisco.*

Take the Elevator, No. 12 Front St.

Terms of Subscription.

Annual Subscription, $3. New subscriptions will be declined without cash in advance. All arrearages must be paid for at the rate of $3.50 per annum.

Advertising Rates.

	1 week.	1 month.	3 mos.	12 mos.

Entered at the S. F. Postoffice as Second-Class Mail Matter.

San Francisco, August 26, 1893.

TABLE OF CONTENTS.

ILLUSTRATIONS.—"Grizzly Giant"—One Product of a Mining County, 129.

EDITORIALS.—More Currency a Necessity; Big Trees in a Mining County; Miscellaneous, 129. Price of Bar Silver; The Three Per Cent Provision; The Comptroller's Error; Miscellaneous, 130. Work of the Debris Commission; Affairs of the Alta Mine; Miscellaneous, 131.

CORRESPONDENCE.—As to Assessment Work; The Mines of Grass Valley, 132.

MISCELLANEOUS.—Tailings, 131. Ecuador Mines in Stralts; The Stewart Silver Bill; The Bland Free Coinsge Bill, 132. Bluing Copper Solntion; Great Velocity of Projectiles; Rats in a Silver Mine; Dividend-Paying Mines; California Stamps in Cornwall; A Mine Long in Litigation; Ships Building for the Navy; Cableway Sketches; The First News of Gold; The Effect of Lichens on Trees, 134.

MECHANICAL PROGRESS.—Raising a Submerged Locomotive; Malleable Iron vs. Cast Steel for Couplers; The Quick-Heating Method of Hardening Steel; Preventing Hard Deposits in Steam Boilers; Sulphur in Cast Iron; A Screw Steamer in Shallow Water, 136.

SCIENTIFIC PROGRESS.—A Toad Buried for Centuries; Miscellaneous, 136-137.

ELECTRICITY.—Do Lightning Rods Protect; Gas vs. Electricity in Paris; Electricity Made Perfectly Plain; An Elictric Jute Mill, 138.

USEFUL INFORMATION.—The Iron Industry; Comparative Values of Timber; Try, Try Again; Miscellaneous, 138-139.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 141-142.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 143.

THE industrial situation in the East appears to be materially improving. Factories are starting up everywhere, and everything points to an early return to a normal state of things. At Pittsburg, Monday, employment was given to between 12,000 and 15,000 idle men by the resumption of operations in the iron and steel plants. Among the mills resuming are the Black Diamond Steel Works, portions of Jones & Laughlin's iron and steel plant and the National Tube Works. Havemeyer's sugar refinery at Williamsburg, New York, resumed operations, giving employment to 4000 hands.

THE sale of delinquent stock of Hale & Norcross, advertised for Friday, August 18th, has been postponed until September 8th. The number of shares advertised as delinquent amounted to 71,000 out of the 112,000 shares of capital. Up to 1 o'clock Friday the number of shares thus delinquent had been reduced to 67,000, which were more than one-half of the capital stock. The directors of the mine, realizing that the bulk of this unpaid stock would go into the treasury of the company, held a meeting and resolved to postpone the sale for twenty days, so as to give the delinquents a last chance to save their shares.

THE temporary paralysis of silver has directed attention of Colorado miners to gold, just as it has in California. The miner is nothing if not the embodiment of activity, and, while silver is down, he hunts gold. On every creek and canyon where color is to be found, men are swarming by hundreds. The Denver *Mining Industry* says a few are making wages, more are making only grub, and most are living on hopes. But the few old miners who understand that kind of work can all make at least grub wages. It is scarcely possible to tell where men are not washing for gold. It would be easier to tell on what streams they are not than on what streams they are.

THE Sutter *Independent* reprints the formal application of Messrs. Mooer & Boyd for permission to operate hydraulic mines, and appears to think that a grave menace to the future well-being of the valley farmers lies therein. If the *Independent*, or any others along the rivers, are disposed to proceed in a lawful manner, they may find ample opportunity to defeat the application of Messrs. Mooer & Boyd should the properties of any adverse parties be endangered or impaired in value by the grant of their application. The conditions imposed by the Caminetti law are so manifold, and the safeguards so numerous, that, as between the miner and farmer, the former is at an actual disadvantage. He is required to give assurance in a substantial and satisfactory manner that all other interests will be protected. The first consideration seems to be the farmer; the second the miner. The *Independent* and its friends should tote fair and agree to give the miner a chance under the law.

Price of Bar Silver.

London has long been setting the price of silver bullion. The most recent qnotations are 34⅞ pence per ounce 925 fine, which is England's standard of fineness. This is very low—not so low as in former weeks, but a tremendous depreciation.

The first great collapse in the price of bar silver was in 1876. Up to 1874 the average price of silver had been for many years equal to or above the par of gold. For seventy-three years, from 1760 to 1833, the ratio of pure gold to pure silver varied from 1 to 13.33 in 1781 to a ratio of 1 to 16.30 in 1815. From 1833 to 1858, an ounce of gold bought from 15.19 to 15.93 ounces of silver. For the next quarter of a century, up to 1883, an ounce of gold on the yearly average basis bought from 15.28 to 17.87 ounces of silver. During that entire period of 123 years, the lowest price was in July, 1876, when silver sold in London at 46½ pence per ounce 925 fine. At 46¾ pence the ratio of gold to silver is as 1 to 20.17. At that figure an ounce of pure silver 1000 fine was worth 1.0248, and the 412½ grain dollar, 900 fine, was worth .7926.

Taking the ordinary acceptation of gold as being the standard of valne, the purchasing power of silver has varied considerably. Between 1781—when the least amount of silver was required to buy an ounce of gold—and 1876—when the average showed the greatest amount of the white metal necessary—the purchasing power of silver depreciated 25.4 per cent.

The contraction in values, occasioned by the policy which found its greatest success in the demonetization of silver, is aptly illustrated in the fact that wheat, the greatest of the world's staples, follows the fluctuations of silver with unswerving accuracy, for it is to be observed that whenever silver is depreciated, so also is wheat, the ratio between the values of wheat and silver being as regular as that between the temperature and the thermometer which indicates it. The fact furnishes fitting comment on the twenty years of warfare upon silver, and is suggestive as to the final result of the fight now waging in Congress over the question of silver coinage. Nothing is ever settled until it is settled right, and the only settlement of the question that can result satisfactorily to the financial health of the nation is the restoration of silver to the position from which it was so mistakenly removed twenty years ago.

With silver quoted at 34⅞ pence per ounce in London, and 74¼ cents in this week's 165,500-ounce purchase in Washington, it would seem that bedrock had been reached. The future depends largely, but not wholly, on the 444 national legislators now in session at the capital.

The Three Per Cent Provision.

A very serious objection which hydraulic miners have urged to the Caminetti law is the requirement that they shall pay to the Government three per cent of the proceeds of the mines. They have mistaken the scope and meaning of the provision. The three per cent provision is totally inoperative under present conditions, and, in absence of a Government appropriation to assist in construction of restraining works, it is not likely to be enforced for awhile yet. When it is in active operation, it will affect those miners only whose debris is impounded in the public restraining works.

Major Heuer of the debris commission calls attention to the reading of the law, and says:

Section 23 of the Caminetti Act says in effect that upon the construction by the commission of dams and other works for the detention of debris from hydranlic mines, and the issuing of the order permitting the working of the mine, the owner shall pay thie tax. Now the commission is not building any dams, for it cannot huild them. And it is not just, I think, to reqnire the mine-owners who are put to great expense in erecting snch dams to pay snch a tax, and the law does not so require.

The exact phraseology of Section 23 is as follows:

That upon the constrnction hy the said commission of dams or other works for the detention of debris from hydraulic mines and the issning of the order provided for hy this Act to any individual, company or corporation to work any mine or mines by hydraulio process, the individual, company or corporation operating therennder working any mine or mines by hydraulic process, the debris from which flows into or is in whole or in part restrained by snch dams or other works erected by said commission, ehall pay a tax of three per centum on the gross proceeds of his, their or its mine so worked, which tax of three per centnm shall be ascertained and paid in accordance with regulations to be adopted by the Secretary of the Treasnry, and the Treasurer of the United States is hereby authorized to receive the same. All sums of money paid into the Treasury under this section shall he set apart and credited to a fund to he known as the "Debris Fund," and ehall be expended by said commission under snpervision of the Chief of Engineers and direction of the Secretary of War, in addition to the appropriations made by law in the constrnction and maintenance of such restraining works and settling reservoirs as may he proper and necessary.

The State of California has set aside $250,000 to defray one-half the expense of construction of restraining works. But it is expressly provided that the appropriation ehall not be available until the United States shall have dedicated a similar amount to the work. The Federal Government seems to be in no great hurry to undertake construction of the dams, but, when it is seen that California is in earnest in its desire to resume hydraulic mining, and, through its delegation in Congress, asks that the appropriation be made, the money will doubtless be forthcoming.

The Comptroller's Error.

The present Comptroller of the Currency, a well-meaning but ignorant young man from the prairies of Illinois, talks of "the 65-cent dollar." He means the silver dollar. It is a common error in those of Mr. Eckles' caliber and information to thus speak of that coin. Were things unknown proposed as things forgot it would be in order to remind the monometallists what the meaning is of the term "dollar." The word dollar originally meant a silver coin, and that is its meaning to-day among most people.

It is absurd and unhistorical for our unsophisticated Comptroller of the Currency to say the silver dollar is worth sixty-five cents. It is worth just one hundred cents—and it always has been worth that much. The gold dollar is a modern invention. Millions of people in this country never saw it, and don't know what it looks like. When it was first coined, within the memory of middle-aged men, it was measured by the silver dollar, and made to conform in weight, value and fineness to it. Comptroller Eckles has no authority to invert the historical and established order—place the gold coin before the silver and measure the ancient dollar by its modern coadjutor. It is gold that has grown comparatively scarce and dear—not silver that has grown plentiful and cheap.

SECRETARY OF WAR LAMONT has responded favorably to the request for an additional engineer for the California Debris Commission, and has detailed Lieutenant C. C. Gillette, formerly on duty under the Mississippi River Commission, to the work. Efforts to convince Assistant Secretary of War Grant that he should act in accordance with the design of the law and make the assignment proved unavailing, and Secretary Lamont was appealed to. He asked the Judge Advocate General for his opinion of the legality of the assignment, and was assured it was proper to make the detail subject to the orders of the War Department. It is not very easy to understand the attitude of the assistant secretary in this matter, except on the ground that he had been invested with a little brief authority and wanted to show it. Government officials who are for a few years allowed to wear shoes too large and are obliged to have their hats made to order are often able to delay and even defeat a meritorious measure; but in this case the efficiency of the Caminetti law has not been impaired.

NEVADA may have deteriorated as a mining State, but in other lines it seems to be doing very well. Irrigation has done much for the State in recent years. Census figures at hand show for 1890 as follows: Total acreage cultivated by irrigation, 224,403; total number of farms, 1341; farms irrigated for crops, 1167; average size of irrigated farms, 192 acres; average cost of water rights, per acre, $7.58; average value of water rights, per acre, $24.60; average annual rental, $.84; average first cost of production, per acre, $10.57; average valuation, per acre, $41.00; apparent profit, less cost of buildings, etc., $21.60; average value of products, per acre, $12.92; cost of productive irrigation systems, $1,251,000; value of samé in 1890; $3,714,000; increase in value, $2,463,000; total cost of water and maintaining ditches in 1889–90, $188,000; value of products, $2,899,000; difference, $2,711,000.

AT the regular monthly meeting of the Executive Committee of the Anti-Debris Association, at Sacramento, Tuesday, a report was received from chemist Flint of Marysville, who took samples of water each day dnring the month of July from the Yuba river for the purpose of determining the amount of sedimentary matter carried in suspension. He gave the results of each day's examination, and added that the river was clearer than it had ever been before. These things sound very strange, in view of the oft-repeated assertion of the anti-debris people that the accumulated debris from the former operation of hydraulic mines would continue to befoul and fill up the rivers for many years to come.

SOME attention is being devoted by Spokane newspapers to an invention of a local miner for the development of placer fields. It is described as "a new machine for throwing water on high bars by the force of the current. It is said to carry a large stream of water with little waste of power. The inventor is now experimenting at a point on the Snake river, where he has located a large amount of high ground, rich in gold, but never worked on account of no water being available."

Work of the Debris Commission.

No official information has reached the city of the appointment of Lieut. C. C. Gillette as an additional engineer of the Debris Commission; but the notification will be given in due course of time. Major Heuer, secretary of the Debris Commission, stated to a representative of the PRESS Wednesday that all he knew relative to the assignment was what had appeared in public print. "The duties of Lieut. Gillette will, I suppose, be to facilitate the work of the Commission," said Major Heuer. "Probably he will find that much of his time must be devoted to answering questions relative to the provisions and workings of the Caminetti law, just as I have been doing for some time. The law does not seem to be as fully understood by miners as it should be, though its full text was published in the PRESS and therefore distributed throughout all parts of California. Speaking for myself, and not for other members of the Commission, I am bound to say that the number of applications for license under the law have been less than I expected. I do not know the reason. It may be that miners think that the cost of mine operation under the law will be too expensive; that, for instance, masonry dams must be erected at great expense, in order to confine the debris. Stone dams will be required in torrential streams, but I think it will be found that brush, earthern, and similar works will generally suffice in dry gulches, ravines and in kindred places. On the recent trip of the Debris Commission to the hydraulic mines we saw one brush dam that cost from $7000 to $10,000 and was successfully impounding 400,000 cubic yards of debris.

"There have been ten applications to resume hydraulic mining under the Caminetti Act," continued Major Heuer, "three of which were made formally. The first is from the Kelly Hill gravel mine of Butte county, of which mention has already been made in the papers. The two other formal applications are from the Omega mine and the Farrell mine, in Nevada county, and they will be considered on September 4th. The Farrell mine is being worked because its debris is doing no injury and there is no objection, but the owners of this mine want to come in under the law to avoid all questions. The other applications were not in accordance with form and were returned for correction."

"What do you think is the attitude of the miners toward the law?"

"I do not know. It has not been the business of the Commission to inquire. It is our duty simply to carry out the law as we find it. It makes little difference to us whether the applications are few or many. But where application for license is made, we expedite matters in every practicable way. A committee from the Commission is promptly dispatched to the location of the mine. A thorough investigation is made so that when the Commission comes to act upon the application it shall be thoroughly informed as to what it is proposed to do."

"What about the expense to the applicant?"

"There is practically no expense."

"Will the Commission work in conjunction with the State Debris Commissioner?"

"Certainly. We are required by law to do so. We have already had several informal talks with Commissioner Kidder, and shall confer with him whenever advisable."

Affairs of the Alta Mine.

A very interesting state of affairs was developed at a meeting of the Alta Mining Co., last week. It was known for some time that the finances of the company had been badly muddled, but the stockholders seem hardly to have been prepared for the full extent of the truth. The books of Treasurer Derby had been experted and his accounts failed to balance by $19,173.65. Derby's claim is that he is not a defaulter, but that when he succeeded Seth Cook as treasurer the latter left a shortage of $50,000, and that he himself had paid $30,000 of the deficit. It appears that when he was elected treasurer Derby made no report to the stockholders of this deficit.

It transpired, from statements made by various stockholders, that the present shortage is the result of the formation of the American Milling Company, started by Seth Cook and ex-Treasurer Derby. It is said to have been established at the expense of the Alta shareholders, and a note for $50,000 was given by the American Milling Company to the Alta to cover this debt. The note was unsecured and the American Milling Company appears as a corporation without property.

In addition to securing to the American Milling Company 23,000 shares of Alta stock, the Cook estate turned over its shares to the American. The shares were sold and the proceeds said by Derby to have been applied on this note, although the latter bears no endorsement of the payment of any part of the amount.

Secretary Osborn never charged this amount to bills receivable. If Derby had made no payments on the note, the books of the company would show a false cash balance of $49,000. As it is, $19,173.65 should be on hand according to the books.

Secretary Osborn has made sworn statements every month that such was the case. The stockholders propose to commence actions against Derby, Osborn and the members of the outgoing board of directors. They announced that they would leave no stone unturned to recover the money diverted from the treasury by Derby.

The new set of officers consists Directors John Landers, Herman Zadig, James McBoyle, J. W. Maguire and E. D. Goodrich. John Landers was chosen president; Herman Zadig, vice-president; J. E. Jacobus, secretary; the Nevada Bank, treasurer; and E. D. Boyle was re-elected superintendent. Mr. Landers announced that he would accept the presidency only for the purpose of trying to unravel the financial difficulties of the Alta. He said that if he were not supported in his efforts in this direction he would retire.

The new president is an old mining man. He was an early operator on the Comstock, and until the last eight years he was, for a long period, actively engaged in mining development in Nevada.

The cash turned over to the new board amounted to only $212.50, and the company is $8000 in debt. A policy of retrenchment was inaugurated in all the departments. Secretary Osborn has been paid $250 a month, with $75 for an assistant. The latter has been dispensed with, and the secretary's salary reduced to $150. The superintendent's monthly stipend has been reduced from $300 to $100 a month, and the president's monthly salary from $125 to $75.

THE formal ceremony of breaking ground for the Midwinter Fair took place in Golden Gate Park Thursday, Aug. 24th. The various business houses of the city were closed in honor of the event, the National Guard was paraded in force, and altogether the dedication took place under circumstances that augur much for the success of the exposition. The chief obstacle which the promoters have had to overcome has, of course, been the subscription of funds. So far something like $350,000 has been secured from San Francisco alone, and there seems little doubt that a total of $500,000 will finally be realized. On the whole, it is creditable alike to the local pride and liberality of the people of San Francisco that such substantial interest has been manifested in the enterprise. The bulk of subscriptions has so far come from people of comparatively small means, but it is confidently expected that capitalists will render all necessary aid before the subscription books close. It is unfortunately true that outside counties regard the fair with feelings more indifferent than could be wished. Some newspapers have even taken a hostile attitude because their various counties have been asked to subscribe, claiming that San Francisco will receive the chief benefit and should foot the bill. Precisely the same thing might have been said, with equal justice, by Illinois interior papers, of the Chicago Exposition. But it was not, and the State subscribed $800,000. The Midwinter Fair is essentially a Pacific coast enterprise, and San Francisco is the proper place to hold it. Times are hard and money scarce. But if interior counties can't raise money they might at least do a little hurrahing. There is the right kind of spirit locally behind the fair, and it should be encouraged in every reasonable manner by all people of California and the Pacific coast.

MEETINGS in the interest of silver are advertised to take place throughout the State Thursday, August 24th (the date of this writing). The outlook is for large and representative gatherings at many points. The sub-committee of the free coinage executive committee has issued several thousand petition papers, which have been circulated throughout this State, Colorado, Utah, Montana, Washington, Oregon and Nevada, and, when filled out, will be forwarded with the resolutions to Washington. In this city several hundred of the most prominent citizens, including bankers, merchants and professional men, have already willingly signed, and among the laboring class the number of signatures reaches into the thousands. One of the blanks was lately returned to the office of the committee that had been signed chiefly by men on Beale, Main, Mission and Howard streets. The sheets were somewhat soiled and across them were written, "Dirty hands with clean hearts; mechanics, engineers, foundrymen, millbuilders and laborers."

THOMAS A. EDISON, the inventor, announces that he has given up electricity and is now devoting his whole time to metallurgy. The recent attention of the great inventor had been directed to coal, from which he attempted to obtain electricity. While results were satisfactory for a time, he gave it up, for he said he could reach no important conclusion for at least several years. If Mr. Edison hereafter devotes his genius exclusively to the solution of metallurgical problems, miners and mining men may look for benefits of a permanent and very profitable nature. Possibly the chemical reduction of ores by some economical process may be achieved.

THE manager of the Anti-Debris Association has gone to Washington to watch any legislation that might come before the present session of Congress affecting the interests of the Sacramento valley. The attorney of the Association has been instructed to be present before the Debris Commission August 29th, when the application of the Kelly Hill Gravel Mining Company will be heard, and watch proceedings; and various functionaries in the employ of the association are still watching the abandoned hydraulic mines to see that there is no infraction of law. On the whole, the system of espionage inaugurated by these self-appointed guardians of the public interest seems to afford several very nice jobs for a number of deserving gentlemen who make a business of protecting the farmer for a consideration.

THE MINERS OF SHASTA COUNTY have been appealed to by the county fair commissioners to furnish quartz specimens for exhibit at the Midwinter Fair. It is proposed to make the Shasta display as fine as any other. The example of Shasta might well be emulated in other mining regions. It seems certain now that the fair will be held, and it will be the greatest event of the kind ever attempted west of the Mississippi river. The fair managers are being well supported by the people of San Francisco, though outside counties have as yet done little or nothing. Considerably over $300,000 has been raised, and doubtless the $500,000 mark will be reached. The managers will then be justified in laying their plans on a million-dollar basis. Ground will be broken probably next week.

MATTERS are improving in Denver. A majority of the banks which went down in the recent crisis have resumed, and it is expected that the remainder will start up by September 1st. Many idle men have been given work on city improvements, and the unemployed population has in other ways been materially reduced. Denver will in course of time assume its former place as one of the most active, enterprising and prosperous towns of the West. The elements of wealth are there, for the mineral resources of Colorado are enormous. Silver will not always be in the dumps. The State can easily increase its gold output. Its people are buoyant, generous, courageous and undismayed. The future is all theirs.

Tailings.

JOHN MCNALLY, of San Francisco, is to succeed George Barman as superintendent of the Virtue mine, near Baker City, Oregon.

COLONEL W. J. SULLIVAN, general manager of the great Candelaria and Holmes silver mines, Candelaria, Nev., has returned from London, after nine months' absence.

SECRETARY HOKE SMITH has decided that he has no authority to lease land on the Uncompahgre reservation, Utah, containing asphalt deposits. They must be restored to the public domain before they can be leased.

GEORGE P. KIRK, a prospector, formerly of San Francisco, shot and killed one Anderson, his partner, May 26th, at Tumgau, Alaska, 1200 miles from Sitka. Kirk says Anderson attempted to run away with their boat and provisions.

THE Enreka Granite Company, of which Ira P. Allen is president, at Rocklin, have just closed a contract with the trustees of the Stockton Library Association to furnish granite for the foundation and about eight feet of the first story of their new library building.

ABOUT September 1st an English company, together with several home capitalists, including Wilbur & Chandler and A. Caldwell of Riverside, and L. C. Moreland, will begin working the placer claims about 15 miles above Yuma, on the California side of the Colorado river.

THE Grass Valley *Tidings* believes it would be a good plan for some of the Gress Valley mining companies to have their stock listed on the San Francisco stock board. If properly managed, such a proceeding would doubtless aid development work and increase the output of the district.

JOHN BURKE, well known all over Idaho, Oregon and Washington, has been in Portland arranging to work a gold mine he has just invested in in southern Oregon. The machinery for the stamp mill will be shipped soon, when he, with one or two other associates, will leave for the scene of operations.

STOCKHOLDERS of the Minnie Mining Company, Gress Valley, have elected the following directors: Samuel Yeo, I. Haas, Samuel Granger, Jas. Bennallack, Frenk Snell. The board has organized by the election of I. Haes as president; Samnel Yeo, vice-president; Jas. H. Bennallack, secretary; Watt & Co., treasurer.

CHARLES S. RICHARDSON has left Gress Valley for Lowell Hill, where he will take charge of the Planet drift gravel mine. In connection with a number of men from below, he has a bond on the property, which is owned by Grass Valley people. It is Mr. Richardson's intention to put about ten men at work on the mine.

ARTICLES OF INCORPORATION have been filed on behalf of the Morning Star and Trenton Milling and Mining Company, for the purpose of carrying on gold and silver mining in Plumas

county. Directors: James T. Landregan, Thomas C. Landregan, Philip Monroe, C. H. Spear, E. A. Holman. Capital, $50,000, folly subscribed.

ORDERS have been issued by the Treasury Department to all sob-treasuries to pay out gold over the counters the same as other classes of money. The effect is to practically place the gold reserve among available Treasnry cash assets. As a resnlt tbe gold balance is somewhat reduced, being slightly below $100,000,000. The net treasnry balance is $11,750,000.

THE Rocklin Granite Co., Placer county, which has been awarded the contract for the stone work on the Lick monnment, has been working upon the contract for several days, says the *Representative*. The granite work will amonnt to a little over $17,000, the entire monoment, when completed (including elaborate bronze work, etc.), to cost $100,000.

NEARLY the entire amount of worn fractional money in the Federal Treasury and various sub-treasuries can be recoined if Congress makes the appropriation of $300,000 recently asked for in a special letter by Secretary Carlisle. The shrinkage of the nominal value of these coins has averaged about three per cent, and the appropriation asked for would cover the loss on $10,000,000.

C. W. HEYER writes to the Winnemucca *Silver State*: "I have traveled many miles and have fonnd no more favorable camp than Kennedy district, in this State, and predict in its near future a prosperons camp. Bnt yon have got to get redncton works there, snch as a mill. As an old miner and furnace man, I would prefer a furnace, especially as the conntry affords all the facilities to get charcoal, floxing, etc."

ARTICLES OF INCORPORATION have been filed on behalf of the Star of India Consolidated Gold Mining Company, for the pnrpose of working the mining properties sitnated in Angels mining district, Calaveras connty, known as the New York, California and Curiosity mines. The capital stock is placed at $1,000,000, and the directors are: Thomas Cole, Robert M. Atkinson, Joseph F. Cnrtis, N. W. Hendricks, J. A. Fairweather.

THE Mammoth Mining Company has filed articles of incorporation. The directors for the first year are: Add C. Hinkson, John F. Cooper, F. T. Van Fleet and J. A. Woodson, of Sscramento, and E. B. Thomas of Grass Valley. The capital stock of the corporation is $100,000, divided into 100,000 shares of the par value of $1 each. The principal place of bnsiness of the corporation is to be in Sacramento. The mine is located in Grass Valley township.

THE copper mines at Copperopolis, Calaveras connty, employing 300 men, were closed down last week. The men were paid off and are now seeking other employment. The tightness of the money market is given as tbe cause of the snspension of the work. The suspension of work hss paralized the business of the town, for everything depended on the mines for snpport. The mines are owned by Frederick Ames of the Union Pacific railroad and part of the estate of Oliver Ames. They were opened in the early '60's, but were idle for many years until five or six years ago.

"THE old Mexican methods of reducing ores is again springing into prominence in Inyo connty," said R. May, a mining man, the other day to a local reporter, "and a few new arrastres have been bnilt this snmmer. The one in onr district is generally refractory, but mnch of it can be worked by the simpler processes. Although the arrastre process is the simplest and cheapest on earth, I am convinced that Inyo county miners will soon close them down and wait until the silver market is relieved of the glut. There is barely a living in the white metal now, unless it is in the shape of four-bit pieces."

THE Mining Burean has received a very curious gift from Victoria, Australia, in the shape of some fossilized fruit. It was found at a depth of 100 feet in a gravel bed in which miners were drifting for gold. Usnally when vegetable matter is preserved it becomes changed by the gradual replacing of its parts with silicions matter. This frnit is carbonized and shows all the lines of the fiber, the meat, the skin and the pit perfectly. What makes the matter more pecnliar is that there are no trees of any sort in the whole sorrounding conntry, nor is there any kind now found like that recovered from the gravel. The specimens were sent to the Mining Bnrean by W. E. Bnrbridge.

ARTICLES of incorporation of a new company to work the Jenny Lind and Godfrey mining claims have been filed with the Nevada Connty Clerk. The capital stock of the company consists of 100,000 shares, of the par value of $1 per share. Tbe directors of the new company are Wm. M. Treloar, C. H. Mills, W. F. Bowden, Arthur Powell and John F. Cooper. A great deal of work was done on the Jenny Lind in early days, but the mine was considered very dangerous, and when John Miners was killed in it all operations ceased. It is a gravel claim of a what is termed a "qnicksand" formation. The company proposes to work deep down, where the danger will practically be eliminated.

IN 1872 Snperintendent John Daggett of the San Francisco Mint was presented with a handsome silver service in recognition of the sale of the Black Bear mine in Siskiyou conntv. It was worth at least $2000, but the Daggetts were not keeping house at that time, and consequently the princely pieces were carefully wrapped, packed and sent to the manufacturers, Vanderslice & Co., for safe keeping. In 1885 the Daggetts called for their silver service, but it had disappeared. Litigation resnlted, and the case went finally into the State Supreme Court. The Daggetts lost. The other day, from an unfreqnented spot, the junior member of Vanderslice & Co. dragged forth a mnsty, spider-ridden, dust-begrimed hox. It was opened, and fonnd to be the long-lost silver set. Litigation has ceased.

COL. SULLIVAN, snperintendent of the Candelaria and Holmes mines, says that the chief obstacle in the way of resnming work is miners' wages. Says the Colonel: "We would resnme operations if the miners at Candelaria would come to me and say they were willing to work for abont $2 a day. I cannot go to them and ask them to do this, but if they would come to me I would pnt 300 or 400 of them at work, low as the price of silver is. This would not be the snm I woold pay them either as soon as silver began to improve. I would steadily raise the wages. In fact, I wonld rather pay $4 a day at $1.29, the price silver once was, than pay $2 now; I wonld make more money." It is not clear jnst what motives of delicacy restrain the Colonel from making his proposition to the miners; but, as he says he can't, no doubt he means he won't.

As to Assessment Work.

TO THE EDITOR:—Please permit me to send you a few remarks about assessment work, and my suggestions in that regard. The modus operandi in regard to assessment work now in force ($100 a year for each claim) is, in my opinion, a determent for the development and general interest of our mining affairs. Every mining man knows there are thousands of people who are holding mining claims without doing any assessment work. All they do is to post a notice of location and relocation, and in that manner keep away other men who, perhaps, would develop the property if it were not already located.

Therefore, I would propose that the now existing law in regard to assessment work be repealed, and that a new law should be enforced, so that parties who are holding mining claims, or take up new claims, pay $10 or more a year for each claim, to the county treasury. The treasurer should issue duplicate receipts for such payment. The miner who paid for his claim or claims should keep one receipt, and the other receipt he should post close to the principal notice of location on his claim for which payment has been made, so that any prospector can see, without losing time, if the holder of a claim has done his duty.

The receipt posted close to the principal notice of location should be of a distinct shape in form and color—easily distinguishable—and the date of payment executed in large letters; thus facilitating prospecting and being a guide for prospectors.

I think a similar law is in existence in Mexico, but I don't know if it contains the provision which I recommend as the most important factor; viz., the posting of the receipt close to the principal notice of location.

The payment of $10 (or more) for each claim already recorded at the date of enforcement of the new law should be made inside of one month of the date of enforcement of the new law, and the posting of the receipt should be done inside of one month of the date of payment; otherwise the claim-holder forfeits positively his right.

A prospector who locates a new claim must make payment at the same time he gets his notice of location recorded, which must be done inside of ten days from the date of notice of location; and inside of one month of the date of payment he must post the receipt for which payment has been made, otherwise he forfeits his right.

I recommend a payment of $10, so as to give the poor prospector a chance, although payment should be a little larger; but I am sure that the payment of only $10, strictly enforced, will do more good to the mining interests in general than the law at present in force.

Many years ago I knew a fellow who located in one week more claims than hairs on the convex surface of his brainpan, and he never prospected, worth mention, one claim. Such fellows are a nuisance in any mining country, and could be easily defeated by establishing a law, which I recommend.

The new law should be enforced at a season when weather will permit the claim-holder to go to his claim and post the receipt for payment on to the principal monument. The provision now in existence, in regard to a patent, should be sustained; because, if a claim-holder can prove that he invested $500, or more, he should get an equivalent for his money invested.

If you find my suggestions worth any consideration, I am sure you will put your shoulder to the wheel, and help to repeal a law which does not fill the bill. C. R A.

Portland, Or., July 30, 1893.

The Mines of Grass Valley.

TO THE EDITOR:—The mining interests of this section seem to be in a more flourishing condition at the present time than they have been for some years past. Twenty-five mines and prospects are being worked, so I am informed, within a radius of three miles of Grass Valley. In the past week I have visited a large number of the mines and prospects in this section and found the most of the developed mines working a full force of men. The W. Y. O. D. (Work Your Own Diggings) and Empire mines, which are situated near each other, are running to the full capacity of their mills on a good grade of ore.

The famous Idaho mine which has been one of the great gold producers of the Pacific slope, is situated about a mile from town. This mine is also one of the deepest-worked gold mines in the United States, having been worked to a vertical depth of 2180 feet. Its production exceeds $11,500,000 up to the present time. The Maryland, which is an extension of the Idaho, is now being opened up and worked through the old Idaho shaft and a large force of men are employed in the mine. The North Star, one of the largest mines in the district, is also running full blast. The Omaha and Lone Jack, situated on Boston Ravine, are now consolidated and are being worked in connection with each other.

New hoisting works are being erected on the old Granite Hill mine preparatory to opening up the mine again.

The Osborn Hill Mining Company, of which Wm. C. Ralston, secretary of the Miners' Association, is president, is opening up the Old Osborn Hill mine. The most profitable results are looked for in the near future from this and the Centennial, and, in fact, all of the properties in that group.

The Crown Point is at present idle, the machinery being insufficient to handle the water in the mine, but Mr. Gauthier, the proprietor, intends putting in new machinery soon with ample capacity to work the mine on an extensive scale.

Although the mining industry is more active in this locality at present than anywhere else on the coast, still I hear that never-ceasing cry of hard times and lack of money at every turn. The mines of this district are among the richest on the coast, and in a year or two more, if the development of mines continue in this district like they have in the past few months, Grass Valley district as a gold producer will take the lead of any district in the United States. The ledges, although small, are of high grade ore and they exist in formations which invariably insure permanency and great depth. ALEX. QUARTZ.

Grass Valley, Cal., Aug. 19, 1893.

Ecuador Mines in Straits.

John George, the machinist, has returned to Grass Valley from South America, where he went last March to take a position in the Playa D'Oro mines in Ecuador. The mines are situated about 120 miles from the coast and 100 miles from Quito, the capital of Ecuador. Mr. George left Ecuador on the 10th of July, arriving in San Francisco on the 14th of August.

In conversation with a *Tidings* reporter, Mr. George stated that none of the glowing promises that were made to him, and the rest of the Nevada Countyans who accompanied him, were fulfilled. They were promised $4.50 per day, but have not received any wages for two months, probably on account of the financial stringency in New York. Capitalists there are largely interested in the mines and they have not been able to send any money down, consequently the miners have not been paid. The mines are on low ground and are utterly worthless. They were worked about 150 years ago by the Spaniards, who realized very little out of them. Provisions are very high, pork costing 40 cents per pound and flour 10 cents. The provisions have to be brought a distance of 60 miles through almost impassable forests in which the trails have to be cut with hatchets as the traveler progresses, and up rapid rivers where the progress is naturally slow. At the time Mr. George left, the stock of provisions was getting very low.

Three pipe-makers had been taken down to manufacture 30-inch hydraulic pipe to work the mines, but as the iron was tied up in San Francisco awaiting payment, the pipe-makers had nothing to do. Mr. George was informed by a letter from San Francisco of the state of affairs, and succeeded in getting money enough from the officers to come home. The climate is very hot and very wet, rain falling every 24 hours, and altogether Mr. George concludes that it is a very good country to keep away from. Nevada Countyans still there are Vic Blodgett, Jas. Petersen, Archie Patterson and Ed Ryan. They will be sent home at the earliest opportunity.

The Bland Free Coinage Bill.

The full text of the bill introduced by Congressman Bland, of Missouri, is as follows:

"Be it enacted, etc., That from and after the passage of this act all holders of silver bullion to the amount of $100 or more, standard weight and fineness, shall be entitled to have the same coined at the mints of the United States into silver dollars of the weight and fineness provided for in section 2 of this Act.

"Section 2. That the silver dollar provided for in this Act shall consist of 412½ grains of standard silver, said dollar to be legal tender for all debts, dues and demands, both public and private.

"Section 3. Holders of silver dollars herein provided for shall be entitled to deposit the same and receive silver certificates in the manner provided by law for the standard silver dollar.

"Section 4. So much of the Act of July 14, 1890, as requires the monthly purchase of 4,500,000 ounces of silver shall be and the same is hereby repealed."

The Stewart Silver Bill.

The silver bill introduced by Senator Stewart, of Nevada is as follows:

"Be it enacted, etc., that the fourteenth section of the Act of January 18, 1837, be and the same is hereby re-enacted, which reads as follows:

"That gold and silver bullion brought to the mint for coinage shall be received and coined by the proper officers for the benefit of the depositor, provided that it shall be lawful to refuse at the mint any deposit of less value than $100, and any bullion so base as to be unsuitable for the operations of the mint, and provided also that when gold and silver are combined, if either of the metals be in such small proportion that it cannot be separated advantageously, no allowance shall be made to the depositor for the value of the metal."

The second section repeals the silver-purchase clause of the Sherman law of 1890.

SPEAKER CRISP on Monday announced the membership and chairmen of the various house committees, several of the most important are as follows:

WAYS AND MEANS—Wm. L. Wilson of West Virginia, Ch., McMillin (Tenn.), Turner (Geo.), Montgomery (Ky.), Whiting (Mich.), Cockran (N. Y.), Stevens (Mass.), Bryan (Neb.), Breckenridge (Ark.), Bynnm (Ind.), Tarsney (Mo.), Reed (Me.) Bnrrows (Mich.), Payne (N. Y.), Dalzell (Penn.), Hopkins (Ill.) Gear (Iowa).

COINAGE, WEIGHTS AND MEASURES—Rd. P. Bland of Missonri, Ch., Tracey (N. Y.), Kilgore (Texas), Epes (Va.), Stone (Ky.), Allen (Miss.), Bankhead (Ala.), Raynor (Md.), Carter (Ohio), Coffeen (Wy.), McKeighan (Neb.), Stone (Pa.), M H. Johnson (N. D.), Dingley (Me.), Sweet (Idaho), Hager (Iowa), Aldrich (Ill.), Rawlins, (Utah).

BANKING AND CURRENCY—Wm. M. Springer of Illinois, Ch., Sperry (Conn.), Cox (Tenn.), Cobb (Mo.), Culberson (Texas), Ellis (Ky.), Cobb (Ala.), Warner (N. Y.), Johnson (Ohio), Black (Ga.), Hall (Mo.), Walker (Mass.), Brosius (Pa.), Henderson (Ill.), Rossell (Conn.), Hangen (Wis.), Johnson (Ind).

MINES AND MINING—Thos. A. E. Weadock of Michigan, Ch., Sipe (Pa.), Tate (Ga.), Ikirt (O.), Richardson (Mich.), Cockrell (Texas). Baker (Kan.), Stephenson (Mich.), Shaw (Wis.). Newlands (Nev.), Cousins (Iowa), Lilly (Pa.), Rawlins (Utah).

Bluing Copper Solution.

Mr. G. F. Beardsley, metallurgist, formerly of Melrose, Cal., contributes to the *Australian Mining Standard* an article on the use of sodium carbonate for bluing the copper solution in the cyanide assay. Mr. Beardsley says:

A few weeks back it became necessary for me to make quite a number of copper assays of the Monnt Lyell copper ore, and the products and residnes of a test smelting of the same. All assayers are familiar with the fact that the indirect assay of copper by means of an acid solution of that metal made blue by an excess of ammonia, and titrated with a standard solution of potassium cyanide, is by far the qnickest and the neatest, and also that it is subject to many sources of error. A number of careful assayers bave devoted much time and trouble to the reduction of these, the most notable of which are the researches of Messrs. Torrey and Eaton (see *Mining and Engineering Journal*, May 9 and June 6 and 27, 1885). One of the sources of error is the indiscriminate use of the acid and ammonia, which, to a great extent, is got around by using a measured quantity of both, bnt still the results are not exact.

In looking over what literature was obtainable on the subject, attention was attracted by an article on "The Volumetric Analysis of Copper" (*Mining and Engineering Journal*, May 30, 1890), which recommends the use of sodium bicarbonate instead of ammonia for bluing. This authority states that no matter what variation is made in the amount of the reagents used, the results are the same, provided there is a slight excess of nitric acid above what is required for the solution of the copper, which condition is always present; also that the blue is more persistent and the end reaction consequently much sharper. All this is fully borne out in the working of the method. As I do not know of the method appearing in any text book on assaying, the following is submitted. Duplicates agree well with each other, but there has been no checking by any other method.

Assay: The ore should be triturated very fine in the agate mortar. Use one gramme or ten grains. Diffuse in a few drops of water in a covered casserole. Treat with 10 c. c. dilute nitric acid (two of acid to one of water). Heat very gently (below the boiling point) until active action has ceased, then evaporate slowly to dryness without removing the cover. The sulphur, if there is any left, should be in one or two yellow buttons; if not, remove on a strip of platinum foil, burn, and dissolve off with a drop or two of nitric acid. Add hydrochloric acid and evaporate the greater bulk of the acid. If silica is present and is to be determined, evaporate to dryness.

There are two methods of separating the copper from the iron, etc. First by precipitation by hydrogen sulphide as sulphide of copper; second by precipitation on zinc as metallic copper.

If the first method is used, dilute, filter, make up about 50 c. c., and heat to boiling. Pass a rapid stream of sulphuretted hydrogen gas through the solution; the solution should contain at least 5 c. c. free hydrochloric acid. Allow to settle a few minutes, filter, wash well with hot water to which a little sulphuretted water has been added. After washing into the point of the filter, remove the filter and its contents from the funnel, open and spread it on the hand and wash the precipitate off with a stream from the wash bottle into a casserole. Add 10 c. c. nitric acid, put the cover on the casserole and evaporate nearly to dryness. There will be two or three small beads of yellow sulphur, which may be ignored. Wash out of the casserole into a beaker and blue the solution by adding a sufficient amount of a cold saturated solution of sodium bicarbonate. If there be not much free nitric acid left from the last evaporation, this will amount to 100 or 150 c. c. for anything under 10 or 12 per cent copper. More copper requires more soda solution. Upon the first addition of soda the copper is precipitated as a carbonate, but upon further addition the precipitate re-dissolves and the solution becomes clear, though of a much lighter color than when blued by ammonia. The solution is now ready for titration by the cyanide solution.

If the second method for the separation of the copper is used, sulphuric acid is added and the solution evaporated until white fumes of sulphuric acid are given off. There should be but little or no free acid left. Dilute with water and filter from the silica. Everything in the casserole must be dissolved by the water except the silica, barium sulphate, etc.; undissolved basic salts retain considerable quantities of copper. Immerse in the filtrate a clean strip of sheet zinc three inches long and one-half inch wide. If the action of the solution on the zinc is too violent, dilute the solution with cold water. When the copper is all precipitated, which may be tested by immersing the point of a clean knife blade in the solution, add a little more sulphuric acid to dissolve the balance of the zinc. When this has totally disappeared, wash the precipitate several times by decantation. Dissolve the copper in a few drops of nitric acid, blue with the soda solution and titrate.

One very noticeable thing during the titration is the changing of the color of the solution from a pale blue to a very deep blue immediately upon the addition of a very small portion of the potassium cyanide solution.

In preparing the copper solution for the purpose of standardizing the cyanide solution, care must be taken not to have the copper go beyond one-half milligram to the cubic centimeter of sodium carbonate solution. In a solution of 1 m. g. copper to 1 c. c. soda solution there slowly separates out crystals of artificial malachite ($CuCO_3+Cu(OH)_2$).

Great Velocity of Projectiles.

A Washington dispatch, August 18, says: At the United States proving grounds on Sandy Hook this afternoon the army ordnance officers broke the record in the United States for velocity of projectiles. Experiments were made with a Brown segmental wire gun which has a bore five inches in diameter and a length of nineteen feet. The powder used was the new but already celebrated Leonard smokeless powder.

Fifteen shots in all were fired, beginning with a charge of only seven pounds and increasing gradually to twenty pounds. The seven-pound charge gave the projectile a muzzle velocity of 1720 feet per second, which cannot be equalled by any similar charge of any other known powder, but the last shot was the record breaker.

A charge of twenty pounds of Leonard smokeless powder projected the elongated cannon ball, weighing 62 pounds, at a muzzle velocity of 2865 feet per second. The experiments were conducted by Lieutenant G. N. Whistler of the Fifth United States Artillery, in the presence of other ordnance officers, J. H. Brown, the inventor of the segmental gun, and Mason E. Leonard, inventor of the smokeless powder.

Rats in a Silver Mine.

The first rats were brought to the Comstock from California in freight wagons, principally, most likely, in the big "prairie schooners," stowed away among boxes and crates of goods. Their rapid increase, after their first appearance on the Comstock, was astonishing, says the *Engineering Journal*. From 10 to 14 young are produced at a birth, and there are several litters each year; besides, a rat is a great grandfather before he is a year old. Then, the rats that colonized the Comstock towns encountered no enemies. There were no cats in the country.

Soon stores, barns, warehouses, hotels—the whole town—were swarming with rats. Cats were then brought over from California, and the first lot sold for $20 to $25 per head. Soon every prairie schooner that crossed the mountains had slung to it a big cage filled with cats of all colors and kinds. The price went down to $10, then to $5 a head, and finally so many cats arrived that they could not be given away.

For some time, however, crates and cages filled with cats—or what was left of them after fighting all over the mountains—continued to arrive, and, no sale being found for them, they were turned loose in the town. Soon the whole place swarmed with cats, and the cat nuisance was worse than the rat nuisance, and it was a thousand times more vociferous.

The rats soon discovered the mines and found therein a congenial home and a home free from the terrifying presence of members of the feline tribe. Never was a cat seen in any of the lower levels of the mines, though they sometimes prowl about the surface of the tunnels. In the first opening of the mines there was no place for the rats, but as soon as the timbers began to be set up and cribs of waste rock built they were able to find safe hiding places; also there was room for them everywhere behind the lagging of the drifts. As they increased in numbers there was on all sides an increase of space through the rapid extraction of ore by the miners.

They doubtless soon discovered that, though man was their enemy on the surface, he was their friend down in the underground drifts and chambers. He shared his meal with them, and they scampered and capered about him with perfect impunity. The warmth of the lower levels appeared to be very congenial to the rats, both old and young. Cold is a thing unknown to them. It is as though they had been given an immense hothouse in which to breed. Any temperature they desire, from 60 degrees to 130 degrees, is at their command. Rats are useful as scavengers in mines. They devour all the scraps of meat and other food thrown upon the ground by the miners while at lunch, eating even the hardest bones, thus preventing bad odor. As the decay of the smallest thing is unendurable in a mine, the miners never intentionally kill a rat.

The miners have a high opinion of their sagacity. The rats generally give the miners the first notice of danger. When a big cave is about to occur, they are seen to swarm out of the drifts and scamper about the floors of a level at unwonted times. The settling of the waste rock probably pinches the animals in their dens, causing them at once to leave in search of less dangerous quarters.

At times, when a mine has been shut down for a few weeks, the rats become ravenously hungry. Then they do not scruple to devour the young, old and weak of their kind. During the suspension of work in a mine that is not connected with other mines that are running, everything eatable in the underground regions is devoured, even the candle drippings on the floors. When work is resumed, the almost famished creatures are astonishingly bold and fearless. Then they will come out of their holes and get upon the underground engines (even when they are in rapid motion) and drink the oil out of the oil cups, quite regardless of the presence of the engineers.

A fire in a mine slaughters the rats by the wholesale. Few escape, as the gases penetrate every nook and cranny of the underground regions, and often so suddenly as to asphyxiate them in their homes.

Dividend-Paying Mines.

The *Mining Review* publishes a list of 81 incorporated dividend-paying mines in the United States, of which 37 are in Colorado, 11 in Montana, 8 in Nevada, 8 in Michigan, 5 in Utah, 4 in California, 3 in Idaho, and others scattered. The greatest amount of dividends has been paid by the Calumet and Hecla copper mine in Michigan—nearly $39,000,000. Next comes the Ontario mine of Utah, with $14,000,000 of dividends, followed by the Granite Mountain Company of Montana, with $12,000,000. These are now the great paying mines of the country, though, of course, they have not produced the amount of bullion which the Consolidated Virginia did in the days of its glory. But the longest record of dividend payments is held by a California mine, the Idaho mine of Grass Valley, which has paid 256 dividends, aggregating $5,450,250.

California Stamps in Cornwall.

At a recent mining meeting in Cornwall, Capt. Josiah Thomas, the manager of the Dolcoath mine, read a paper descriptive of the Californian stamps recently introduced by him into the county, says the London *Mining Journal*. He said the Cornish stamps, almost universally used throughout the county for stamping tinstuff, were known as "gravitation stamps," the work done depending mainly on the weight of the heads and the height they were lifted. The new Californian stamps recently erected at the Dolcoath mine were also gravitation stamps, but were constructed on a different principle. The heads and lifters were round and made to revolve, the lifters, three inches in diameter, working in teak and wood guides. The heads were fitted in the bottom with cast-iron shoes, of about 1¼ cwts. each, which take all the wear, so that there is practically no wear in the heads themselves. There were at present 40 heads at work at Dolcoath, but the steam engine was of sufficient power to drive an additional 40 heads. There were eight iron coffers with five heads in each, arranged in four batteries of ten heads each, driven off the main shaft by a separate leather belt to each battery. Cams lifting the heads twice to a round are fixed on a cam shaft five inches in diameter, and there was a separate finger or "jack up" provided for each lifter, so that each coffer can be quickly stopped for repairs or renewals when required without interfering with the working of the remaining stamps. The falling weight of each head was 800 lbs., set to drop nine inches, and run at a speed of 80 drops per minute. The gate is 15 by 45 inches, and has 132 holes to the square inch. The engine was of the modern girder type compound horizontal and jet-condensing, coupled at right angles with heavy fly-wheel between. The chief advantages of the Californian stamps over the Cornish stamps are that the steam is worked at 100 lbs. pressure instead of about 40 lbs., so that the engine works much more economically. The cam stamps shafts, with cams for lifting the heads, not being more than about one-fifth the weight of the huge iron axles and cams in the Cornish stamps for a similar output, a much less power was required to turn the axles. The heads being circular, and revolving at every lift, they wore much more evenly and consequently did much more effective work. The wear and tear of the heads and lifters and of most of the working parts of the stamps was much less than in the old stamps, and the friction was also considerably lessened. Much less time was occupied in changing the heads and in stopping for repairs. The consumption of fuel as compared with power shown by indicator diagrams was 2 38 lbs. of coal per indicated horse-power per hour, being equal to a duty of 70,000,000 lbs. lifted one foot high by the consumption of 112 lbs. of coal. The output of tinstuff of ordinary size and hardness was about two tons per head in 24 hours when the stamps were kept fully at work, the consumption of coal being 39.27 cwts., or nearly two tons, for the 40 heads. This was about twice as much stuff per head as was stamped by the average Cornish stamp, with about the same quantity of coals. The whole of the plant at Dolcoath was supplied by Messrs. Harvey & Co. of Hayle. It was ordered on June 13, 1892, and, together with the dressing floors, was completed and set to work on November 28, 1892. In conclusion, he stated that several mining agents who had worked similar stamps to the new ones at Dolcoath in other parts of the world had told him they would rather pay for the Californian stamps than have the others for nothing. At first he received those statements with incredulity, but from the experience he had already had of the Californian stamps he did not think those agents were very far wrong in their opinion. (Applause.)

Mr. E. G. Heard asked whether Capt. Josiah Thomas could tell them where the stamps were invented, and why they were called Californian stamps.

Capt. Thomas replied that it had been stated that they were worked first in Cornwall 40 years ago. (Laughter.) He gave that on the authority of Messrs. Harvey & Co. of Hayle. After that the stamps were introduced into California and considerably improved in all their working parts. When in Dakota he saw on a large gold mine 700 heads of stamps crushing more stuff than was raised in Cornwall every day, and the managers told him they intended erecting more Californiao stamps in order to crush 4000 tons of stuff every day. (Hear, hear.)

Mr. Hicks, Redruth, while admitting Cornishmen were the best miners in the world, stated that they were not good mechanical engineers, and, as a consequence, companies who required men to manage their mining properties were going elsewhere to obtain them.

A Mine Long in Litigation.

The case of Purcell et al. vs. Heald et al. is an action to quiet title to the Rising Star quartz claim, which is located in the Plymouth mining district, east of the Indiana and contiguous thereto. The Indiana is part of the mining property of the Plymouth Consolidated, and hence is supposed to be valuable, says the Amador *Ledger*.

The claim was purchased in June, 1877, by Ed Purcell, Pat Purcell and James O'Brien, under the name of the Rising Star Gold Mine. In June, 1879, Sell, Bridge et al. also located the same property, calling it the Montezuma mine, and organizing the John Gold Mining Co. In 1880 suit was instituted by the Rising Star claimants against the John Gold Mining Co. to quiet title. The case was called by the court and dismissed without prejudice. The tragic events of the affair occurred in 1880, when the John Gold people tried to resume operations they had commenced in 1879, and were driven from the property by James O'Brien and Thomas Higgins.

In 1881–2–3 the Rising Star Co. did assessment work on the property, and in 1883 or the early part of 1884 they had a falling out among themselves, with the result that on

December 1, 1884, Higgins recorded a notice of location on the property, calling it the Red Oak. He went to work on the 2d of December without having posted notices upon the claim and gave to Pat Purcell's wife and to James O'Brien's wife a one-quarter interest each in the claim. Ed Purcell and R. D. Reeves, who had become an owner, knew nothing of Higgins' location until January, 1885. In February, 1885, C. B. Armstrong, now deceased, was given a one-fifth interest with the original locators, as an attorney's fee, and in the same year Higgins was cited to appear at the Land Office at Sacramento. He did so, as did also the other claimants. The Register and Receiver of the Land Office sustained Higgins' location, and the Rising Star took an appeal to the Land Office at Washington. Here the John Gold Mining Co. was shut out, as it perfected no appeal. The decision at Washington was that the matter must be settled in the local courts. In 1885 Heald of Nashville became interested with Higgins as financial backer of the enterprise, and hence the suit which was commenced is entitled Purcell et al. vs. Heald et al. The case has been before the courts at various times, but from one cause or another has been postponed, and went to trial again on Monday. The case is being tried before Judge Davis.

Ships Building for the Navy.

A press dispatch from Washington gives the following details in regard to the war vessels now under construction for the United States Navy. Ships in various stages of construction are as follows:

Name.	Class.	Tons.	Months to complete.
Montgomery	Cruiser	2,000	4
Marblehead	Cruiser	2,000	6
Cincinnati	Cruiser	3,183	6
Raleigh	Cruiser	3,183	6
Columbia	Cruiser	7,350	9
Olympia	Cruiser	5,500	8
Maine	Armored cruiser	6,648	4
Texas	Battleship.	6,300	10
Kalahdin	Ram	2,183	12
Massachusetts	Battleship.	10,200	24
Indiana	Battleship.	10,200	24
Ericcson	Ferryboat.	120	6

There are still on the stocks, in various stages of completion, the following vessels:

Name.	Class.	Tons.	Months to complete.
Oregon	Battleship.	10,200	30
Iowa	Battleship.	11,296	36
Brooklyn	Armored cruiser	9,150	36
Minneapolis	Cruiser	7,350	24

An appropriation was made last March for three gunboats of 1200 tons each, and designs are now being prepared in the bureau. Plans for four second-class torpedo boats to be carried by the Maine and Texas are also in preparation. The Puritan, Amphitrite, Terror and Monadnock are approaching completion at the navy yards. Work has been carried on on these vessels since 1888, and that they have not been completed long ago is because the armor contractors have not delivered the material.

Cableway Sketches.

The Lidgerwood Manufacturing Company has issued from its headquarters at 96 Liberty street, New York, the sixth of its series of sketch-books. It bears the title, "Cableway Sketches," and contains 64 pages of valuable information regarding cableways, tastefully illustrated by a number of deftly executed pen and ink sketches and several fine half-tone engravings—probably 50 illustrations in all. A portion of the matter contained in the last sketch-book, "Open Pit Mining," is reproduced in "Cableway Sketches," treating as it does of a very important branch of cableway service. With this exception, the pamphlet is wholly devoted to the construction of dams and the operation of quarries, using the Lidgerwood cableway. The Sodam, Austin, Butte City and Coosa dams are profusely illustrated, different stages in their construction being shown. Several views are also printed illustrating the great advantage of the cableway for stripping quarries as well as for general quarry use. The longest cableway ever sold for quarrying was 1200′ span, load ten tons. The heaviest weight handled up to the present time is twelve tons on an 800′ span. "Cableway Sketches" is intended for free circulation, and copies of it may be had by addressing the Lidgerwood Manufacturing Company of New York, Boston, Chicago, St. Louis, Pittsburg or Portland, Or. The pamphlet reflects credit on all interested in its preparation and publication.

The First News of Gold.

Charles Halleck contributes an interesting bit of history to the *Post* of Washington, being another episode of the California gold discovery. Mr. Halleck was informed of the incident by Capt. John Wilkinson, who, in 1848, was sailing-master of the sloop-of-war Saratoga, commanded by Captain D. D. Farragut. While the Saratoga was lying at Sacrificios, off the coast of Mexico, in April of that year, she was hailed one dark night by a launch, and the party being duly admitted on board proved to be the *ci devant* Midshipman Beale of California (afterward General E. F. Beale), who had just crossed Mexico, disguised as an English lieutenant, bringing the first specimens of gold from the new El Dorado.

Up to that time the discoveries on the Pacific Coast had not been made known, and it was the report brought by Beale which stimulated the gold fever all over the country and laid the foundation of San Francisco and of his own financial success. It was a feat of great daring to cross such an uncharted country as Mexico, while still writhing under the bitterness of defeat after the close of the Mexican war, when Americans so recently drew reprieves of life by the chances of a lottery in which black and white beans were the arbiters of destiny.

The Effect of Lichens on Trees.

[The following paper by Samuel J. Holmes of the University of California was recently read at a meeting of the State Horticultural Society. It relates to the growth on the bark of trees which is commonly termed "moss," and is thus of direct interest to orchardists, especially in regions near the coast where this growth is greatest. It has long been a question whether the moss was injurious or not, and Mr. Holmes' investigation shows that clean trees are the proper trees to grow.]

A New Subject.—The effect of lichens on trees is a subject which, we believe, has never been thoroughly studied. We have not been able to find more than a passing remark on the subject in any of the literature to which we have had access. The attention of botanists has been devoted to the morphology and physiology of lichens themselves, without much reference to their relations to their hosts. They certainly have not regarded them in the light of serious enemies to the trees on which they live. They are generally held to be epiphytes, or air plants, the bark of the tree forming the substrate for their support.

Throughout the damper portions of California, where the fruit trees become thickly covered with lichens, they have been regarded by the fruit-growers as a serious pest. Much money and labor are expended to clean the trees of these foreign growths. It is certainly a fact that trees that are badly overgrown with lichens are apt to be lacking in vigor. This, however, is not conclusive evidence that the lichens are the cause of the phenomenon, although it strongly supports this conclusion. Dead trees are generally covered more thickly than live ones, thus showing that the lichens are not dependent for their support upon materials that the tree elaborates. On comparing the dead twigs with the live ones on the same tree, the lichens will be found to be the largest on the dead twigs. This may be because the lichens are parasitic and have killed the twigs or because they are saprophytic and thrive best on the bark which is most decayed. Entire parasitism is out of the question, for the parasite in that case would die when its host died, but there is nothing against the supposition that the lichens are partially parasitic. This would account for less vigor of the badly infested trees and the fact that the lichens continued to live after the death of their host. Another reason might be brought forward to account for the greater prevalence of lichens on sickly or dead trees. The bark of thrifty and vigorous trees is generally brighter and smoother than the bark of sickly ones, and the spores of lichens would find less chance of attachment. This is probably the reason why smooth-barked trees, like the cherry and apricot are almost entirely free from lichens, while the rough-barked oaks and soft maples are often thickly overgrown with them.

How Lichens Grow.—The character of the bark is an important element in determining what species of lichens will grow upon it. Our common lichens will not thrive well on the bark of pines and cedars, though there are some species of lichens which are peculiar to those trees. There are lichens which grow upon mosses, and there are others which are peculiar to other species of lichens. These facts point strongly to the conclusion that lichens derive their support, in part at least, from their substrate. A further argument in the same direction is the fact that lichens often contain a large percentage of mineral matter. The only other source of the mineral constituents beside the bark is the dust which always collects more or less around their base; it seems more probable that the minerals were derived from the bark than from this source.

The Method of Investigation.—The foregoing facts are not conclusive evidence of the injurious effect of lichens on trees. In order to gain further light upon the subject we began a study of the method of attachment of the lichen to the bark. The bark used was that of the soft maple, which was overgrown with a foliaceous lichen, *Ramalina Menzresii.* Sections were cut through the point of attachment of bark and lichen, and examined by the microscope for evidences of local injury. In order to trace the course of the mycelium of the lichen, we tried several methods of double staining. Decidedly the best results were obtained with the aniline colors. About the only other stain that we found of service was acetic acid carmine. Sections were left in a strong solution for 24 hours and then slightly decolorized. The mycelium was tinged red, the cork cells remaining unstained. The action of the cork toward the aniline stains was peculiar and quite decided. We found that several of the stains would color it quite strongly and leave the lichen almost uncolored; others again would stain the lichen and not tinge the cork cells; others, as Bismark brown, would stain both bark and lichen uniformly. Picro-nigrosin stains the mycelium a very dark blue and the cork yellow. Aniline green colors the cork cells a bright green and the mycelium with brown. By combining different stains we were able to differentiate the cork and mycelium quite sharply. Aniline green (saturated solution in one per cent acetic acid solution in water) with an equal amount of picro-nigrosin, and aniline green and gentian violet, gentian violet and saffranin, are combinations which give good results. Sections were left in these stains 24 hours and decolorized.

On examining a section through the point of attachment of the lichen to the bark, it will be seen that the connection between the two is not superficial, but that the mycelium threads of the lichen ramify and intertwine themselves among the cells of the bark in the most intimate manner. The mycelium threads penetrate between the cells, loosen them from each other and gradually force them farther and farther apart. The cells thus come to be imbedded in the substance of the lichen, and as the lichen grows they are carried farther and farther away from their original positions. Having removed the superficial layers of cells of the bark, the lichen attacks those next beneath, and so on until it penetrates the entire thickness of the corky layer. The specimen shown and called Fig. 1 is a section across the base of a large lichen. All the superficial cells are surrounded by the mycellum threads, which have separated them from each other and are carrying them out. Farther out can be seen cells which have been transported quite a distance from their original situations. Often large groups are surrounded by the lichen and drawn up into its substance. It is usual to find under a large lichen a hole through the entire corky layer, which has been excavated by this process. This is probably the cause of the gap in the layer of cork in Fig. 1.

Specimen shown as Fig. 2 is a section a little to one side of the middle of the attachment of a lichen. It can there be seen how several layers of cells are being carried outward. This stage shows the beginning of what subsequently would become one of the holes through the cork at the base of the lichen. All stages can be traced from this the conditions shown in Figs. 1 and 5.

Specimen shown as Fig. 3 is a cut showing how the lichen has penetrated nearly if not quite to the growing cells. The mycelium acts as a kind of wedge, forcing the cells apart and growing deeper and deeper into the bark. The cells from the sides of the opening are being removed at the same time. In a short time a hole would be made here through the cork as deep as the live part. A hole having been thus excavated, it is continually enlarged by the same process of removing cells.

Specimen shown as Fig. 5 is a section through the base of quite a large lichen. The base is hollow—it being an old lichen—and the cells removed from the middle portion of the excavation do not appear. Cells are being carried away from the edges as well as the upper side of the bark. A large mass of cells on the left of the hole is being carried away entirely. Similar evidence of the removal of cells is to be seen in almost any section through the base of a lichen.

What is the Effect of This Removal of the Cells of the Bark?—An examination of the tissue below the point of removal shows us unmistakably that an additional production of cells occurs there to supply the place of the bark which has been removed. Specimen shown as Fig. 4 shows us what invariably occurs whenever the lichen has penetrated the center bark. We see, then, a hole that has been excavated through the regularly arranged cells of the cork and filled with the mycelium of the lichen. Immediately under this excavation we can see a triangular eminence of cork cells which have been produced there in great abundance to fill the gap and have caused the other layers to be tilted up. Fig. 5 shows under the edges of the old cork layer, which, being torn away, masses of cells which are forming to take its place. The break in the bark is not healed, however, for the new formation of cells becomes stripped off as the old layer was taken away. The process of removing cells and the production of new ones goes on continuously.

Specimen shown as Fig. 6 is a typical illustration of a quite common state of affairs under a lichen. It will be seen that the aggregate thickness of the disturbed layers of bark is much greater than thickness of the bark on either side. The spaces between these layers are filled by the mycelium of the lichen, which as they grow push the layers of bark outward. The interpretation of this section is, I think, that successive cork layers have been produced and carried out, the new bark forming as the old is carried away. As a new layer of cork is formed the mycelium threads of the lichen work their way through it, split it off and gradually push it farther and farther outward. A new layer forms under this and is carried out in the same manner. Successive layers having been thus formed and split off would bring about the condition shown in the figure.

How the Injury is Done.—The process by which a lichen injures a tree, then, is this: The mycelium threads pervade the corky layer of the bark, break it up and carry the cells outward. As a remedy for this, or, perhaps, as a result of the unnatural stimulation due to the presence of the mycelium threads, an extra growth of cork cells is produced at the point of injury. Now, the production of this additional amount of cork cells is plainly a tax upon the vitality of the tree. In the case of an exceedingly "mossy" specimen where the lickens are as thick as they can well grow, the effect upon the vigor of the tree must be great. It is common to find in situations where the air contains much moisture trees which are simply a mass of lichens as far as the new growth. The entire bark would be in that case in an unnatural and unhealthy condition, and it is no wonder, therefore, that such trees are often found to lack vigor.

Besides the mode of injury just described there are probably other modes by which lichens injure their hosts. The products of vegetable decomposition may accumulate under the lichens and may have an injurious effect. The retention of moisture forms decomposition, and any soluble materials thus produced and prevented by the lichens from being removed would work their way into the crevices in the bark along with the mycelium threads, and quite likely produce injurious effects upon the growing tissue.

We are not in a position to decide whether or not the lichens draw water from the living tissue. It seems very certain that they draw moisture from the outer bark and I see no reason why the transference of moisture from the inner to the outer bark would not take place by osmosis to compensate for that which is withdrawn by the lichen. If water be thus withdrawn the food materials which are dissolved in it must also be withdrawn and the tree must then suffer from a direct loss of nutritive material. In order to prove that a transfer of sap takes place we introduced coloring matter into the bark with the purpose of finding out whether or not it worked its way into the lichen. The coloring matter could get into the lichen only by being carried there by means of the water withdrawn from the growing tissue. Our experiments in this direction were incomplete and their negative results should therefore be given little weight. We hope to test this matter more thoroughly in the future.

A New and Important Book on Coal Mining.

JUST READY.

The Mine Foreman's Handbook

Of Practical and Theoretical Information on the Opening, Ventilating and Working of Collieries. Questions and Answers on Practical and Theoretical Coal Mining. Designed to Assist Students and Others in Passing Examinations for Mine Foremanships. By ROBERT MACFILLINE, ex Inspector of Mines in Pennsylvania, Superintendent of Coal Mines. A new, revised and enlarged edition, illustrated by 114 engravings, in one volume, 8vo, 337 pages, price $ 3.75.

☞ *By mail free of postage, at the publication price, to any address in the world.*

ABSTRACT OF CONTENTS.- Chapter I, Mine Gases; II, Safety Lamps and Instruments; III, Ventilation; IV, Ventilation Continued; V, Ventilation Continued; VI, Maps—Pillars; VII, Mine Timber Dams, etc; VIII, Opening Collieries; IX, Railroad Tracks, Switches, Frogs, Pulleys, etc., in and about a Mine; Ind x.

☞ *An Illustrated Circular of 4 pages, quarto, giving the full Table of Contents of the above volume, sent free to any one who will furnish his address.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other catalogues, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish us with his address.*

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is berally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Mechanical Progress.

Raising a Submerged Locomotive.

A very interesting mechanical feat has just been accomplished at Port Costa. On August 10th a locomotive weot driving on to the big ferry-hoat and failed to stop in time, plungiog nose-down into the turhid waters of Carquinez straits. The engineer and fireman jumped and were saved. The tender and cars remained on the ferry. The water was deep enough to bury the cab, but the ferry-boat was penned in at the slip. Elevating sunken engines is not a new thing, but in this case the locomotive stood bolt upright, and was sunk deep in the mud, making the task very awkward. Last Saturday night an immense shears of two long 12x12 inch timbers, crossed at the top, was raised on the edge of the boat, and immense pulleys were hung where the timbers crossed. Then a diver went down to fasten great cables on either side to the end of the steel framework under the boller. It took hours to get the powerful tackling ready for operation by four engines standing on the hoat ready to pull. A dredger was placed opposite, ready to pull with its steam winch. The first pull was made on Sunday evening, but with all the great cables, pulleys, engines, etc., the 80 tons under water would not budge. Cable after cable, nearly three inches in diameter, snapped, great chains broke, and things generally gave way when the engines started in to puff and pull. The big shears bent and the cables kept spl'ntering the cab under water.

At last the strength and power of the apparatus were douhled. Two more timhers were added to the shears, cables were hitched around the dome, over the boiler, and a fifth engine came on the hoat. The force worked all night, and at 7 n'clock Monday morning they were ready for another pull. It was calculated that the suction created in the mud added 40 or 50 tons to the weight of the engine, but the pulleys trebled the power and the five engines were practically made equal to 15 at work.

It was hard to get the engines to pull exactly together, and, as their wheels would slip and whirl, cables would keep snapping and the tackle generally would hend and crack and break.

During the forenoon a pull altogether started the 80 tons, and slowly the cab appeared above the water. At 3 o'clock in the afternoon the smokestack was just under water, and the giant engine was swinging in the air by great cables from the apex of the shears. When it was got a little higher, the steam winch in the dredger pulled the front end of the engine outward, the shears was slowly swung backward, and, while the five engines kept their grip on the swinging mass, it was swung backward over the deck of the steamer and then slowly lowered to the tracks it had left and finally hauled away to the little roundhouse there, where a hose washed a ton or so of mud from the disreputable-looking thing, which, however, was more defiled than damaged by its aquatic experience.

Malleable Iron vs. Cast Steel for Couplers.

At Chicago there were many steel couplers, but only four hrands of cast steel represented, and two special hrands of malleahle iron stood the test hetter than three of the brands of steel. Three of the four brands of steel gave quite bad results. Both of the special brands of malleable iron gave excellent results. At Altoona four brands of steel were entered. Two brands stood the test and went far heyond it. The other two brands were very ordinary, and did not average as well as the two special brands of malleable iron. The averages are as follows: Two special hrands of malleable iron, 7⅛ blows, two out of four hrands of steel, 3¼ blows. The average number of blows tor the special brands of malleable lron was 7⅛ blows, or 2⅛ more blows than the proposed test, hence the average special brands of malleable lron met the test while the two ordinary brands of steel did not meet the test. * * * * *

One advantage of malleable iron for car couplers is that it can be cast perfectly solid and free from blow-holes, and malleable-iron castings as a rule are more uniform with less attention in manufacture than steel castings. One of the toughest brands of cast steel that has been used for couplers is pretty well honeycombed and has a very suspicious appearance, but it is, in fact, a good strong material. The softer the steel, as a rule, the more difficult it is to make solid castings. So far only one steel company has succeeded in turning out any considerahle number of cast steel couplers, with few blowholes, that will stand the test. It is a simple matter to cast steel solid if softness and toughness are not demanded. A coupler is difficult to cast in steel, and a steel that will he solld when cast in other shapes and be soft and tough at the same time, often fails to be solid when cast in couplers.—Railroad Gazette.

The Quick-Heating Method of Hardening Steel.

That steel can be heated for safe hardenlng hy more than one method admits of no question. The advocates of the quick-heating system at one time claimed much for this mode, and there are still some old-time smiths who will not heat to harden in any other way.

A veteran in steel practice reminds us, however, that the quick-heating plan was in vogue at a time when everything was faced with steel—that ls, a piece of steel, say three-eighths inch thick or more, was welded or plated on iron and this was heated up quickly for hardening.

The smiths who followed this practice were skilled in the art and could sometimes harden steel of high tempering qualities suitable for purposes such as roll-turning tools and plugs.

The considerahle loss of rolls in hardening, with the best appliances for handling, indicates that where a man can bring these out sound by following the quick-heating method, he had hetter continue in the old way; he would he extremely unwise to change.

The veteran to whom allusion is made has himself hardened ln a single day as many as six large rolls weighing 500 pounds each, or 3000 pounds altogether, and he heated them all thoroughly in a furnace and did not break one. They were mint rolls for "Uncle Sam," and the steel was Crescent special, made with full knowledge of the mode of hardening.

One person may heat a certain shape in an air-tight box with bone and charcoal, while another may prefer the quick-heating method, and both may be alike successful. This is not always the case, but where it is it would be unwise for either to change the mode which has proved itself a success in practice, especially as the steelmaker could be coaxed to try his hand at furnishing steel of tempering qualities to suit either method.—Sparks from the Crescent Anvil.

Preventing Hard Deposits in Steam Boilers.

M. Schmidt, the chief engineer of the Association of Steam Boiler Owners of the Departments of the Somme, Aisne and Oise, reports to his association a very simple method by which a certain boiler user manages to avoid the formation of hard deposits in hls hoilers. It is nothlng more than the following: There are two hoilers in use at one time, and one at rest. The water in use is very bad, being very calcareous and magnesic, with organic matter, chlorides, and a little sulphate of lime. Each hoiler is allowed to go on working for about 500 hours hefore being cleaned. It is then stopped, with the water in it, and allowed to cool down for about a week. The masonry is allowed to become cold; and then the tap is opened, and the safety valve is also opened, so that the water runs naturally out of the boiler. When the boiler is empty it is entered and simply swept. The deposit is in the form of damp mud, easlly swept away, and leaving the hoiler as clean inside as if it were new. This method has been in use for the past five years; and it would appear to lead to the conclusion that the ordinary hardening of the deposits in boilers is due to the absence of water in the hoilers, while the mud and the iron are being heated by the brickwork when the boiler has been emptied by the ordinary method under pressure. It is necessary, however, to be able to do without the particular boiler for eight days.—Gas World, London.

Sulphur in Cast Iron.

In a paper hefore the International Engineering Congress, Mining Engineers' Divlsion, at Chicago, last week, Mr. W. J. Keep of Detroit takes the ground that writers upon the evll effects of sulphur in cast iron have charged to this element more than properly belongs to it. It is a matter of common belief among founders that a small amount of sulphur in the fuel will work great damage, and that a cracked casting or anything out of the ordinary way ls to be laid to sulphurous fuel. In following up his inquiry into the subject, Mr. Keep corresponded with users of sulphurous iron ores and they answered, without exception, that but a small percentage of sulphur could be made to remaln in carbonized iron; that it was difficult, if not impossible, to introduce sulphur into gray cast iron, or intn any carbonized iron.

Mr. Keep made a number of tests, details of which are given in his paper, showing that whether the results which have always been ascribed tn sulphur are produced by some other cause, or directly by the sulphur in the fuel, they are not more to be feared than many accidents of foundry running. "They do not indicate that the iron has taken up sulphur to a damaging extent, and the evil can be prevented, or can be overcome next day by adding enough silicon iron to replace the silicon that has heen driven out."

One of the tests consisted in melting 25 pounds of Swedish gray charcoal pig iron containing 1.249 silicon and 0.187 manganese, and feeding slowly eight pounds of hrimstone, keeping it as closely covered as possihle. When the operation was completed, there was at the hottom about five pounds of silver-white iron covered with a very rich sulphide of iron. The white iron showed 0.58 sulphur—conclusive proof that a carhonized iron could not artificlally be made rich alone in snlphur. Messrs. Weston & Smith, Mr. Keep adds, found it was difficult to cause cast iron to take up sulphur. The conclusion derived from all the tests was that sulphur, if present to any extent in cast iron, "tends to increase shrinkage and to turn the iron white;" but to prove this tendency, it was necessary to add percentages of sulphur never found in commercial pig iron. In white iron, it is agreed, not more than 0.75 per cent of sulphur, in mottled iron not more than 0.25 per cent, and in gray foundry iron not more than a few hundredths of one per cent can he found.

A Screw Steamer in Shallow Water.

Something of a novelty in shiphuilding is reported from England. Messrs. Yarrow & Co. have built, for service in the Zamhesi river, in East Africa, a boat 45 feet long, having 7 feet beam and drawing only 12 inches of water. The bottom is perfectly flat, and the bow is spoon-shaped. The chief novelty in her construction is the provislon for keeping the screw, which has a diameter of two feet, submerged. This difficulty is met by having the shaft on a level with the vessel's bottom, and building a sort of horizontal tunnel over the propeller. In some earlier inventions of this kind it was considered necessary to pump water up lnto this tunnel in order to keep the screw entirely immersed. But experience has shown that the action of the propeller itself is quite sufficient to draw up the water and drive the air out at the after end of the tunnel. The *Engineer*, a London publication, says:

"On trial in the Thames a speed of seven to eight miles an hour was easlly maintalned, and the towing power of the boat was excellent. This little vessel is capable of seating comfortably about 35 passengers, but it is mainly iotended for towing small native barges. There is a wooden awning extending the whole length, to serve as a protectlon against sun and rain. Steam is generated hy a horizontal boiler. The steering wheel is forward as usual in vessels for tortuous rivers, where a good lookout for snags, etc., is of the utmost lmportance. The hull is constructed of galvanized steel, which is the most durable material for African river steamers."

FENDERS ON STREET CARS.—Cahle and electric cars in some cities are provided with fenders, which come down within a few inches of the track, and which are almost as efficacious as a locomotive's "cow-catcher" in saving the lives of people or animals which may be ahead of these vehlcles. These, however, are fixed, and are not always low enough. An improved safeguard of this class has recently heen tried in Boston. An apron, made of parallel steel wires, slightly curved, projects from the lower edge of the front dashboard, forward and downward, on a slant. It is square across the front, where the wires are attached to a horizontal rod. By means of a lever, the motorman or gripman can lower thls apron so as to touch the rails (where it rests on small rollers), and thus slide under any obstacle, shovel-fashion. Usually, however, the forward edge is carried at a greater height.

Scientific Progress.

A Toad Buried for Centuries.

A dispatch from Tacoma, Wash., Aug. 18th, has the following:

The ancient toad, with curious cat-like claws, that was found embedded under 17 feet of hardpan in this city two weeks ago, has gone into a trance again and convinced everybody that it can suspend animation indefinitely at will or hy accident.

This toad is about the size of an egg. Its color is of the same grayish shade as the hardpan, and resembles a tree toad more than any other of its hrothers or sisters. Some men were digging a cistern when one of them drove his pick into the hard earth, and at the end of the pick he found a smooth hole, in which was the toad, apparently dead.

Ten minutes in the open air hrought the toad to life. He ate several flies that were captured for hlm, and until yesterday afternoon had lived two weeks in a bottle, the hottom of which was covered with water and pulverized earth. Hundreds have inspected him, and there have heen many conjectures as to how many thousand years he had been in the earth. That he did not die after heing in the open air a few hours surprised all the members of the Tacoma Academy of Sciences. Yesterday he crawled out of his bottle and fled. This morning he was found pulseless, rigid and cold, wedged between a stick and a kitchen sink at the home of Henry Henderson, on whose premises he was found. He was pronounced dead, placed in some water, and was about to be buried when he regained animation. This resurrection, the Hendersons and hundreds of others say, is conclusive evidence of the fact that this toad has been buried for centuries, and the little hopper is now a greater curiosity than ever.

HARDSHIPS OF LIFE IN THE POLAR REGION.—The whole region is one of severe cold, and the sea is frozen for the greater part of the year, land and water becoming almost indistinguishable, but for the incessant movement and drift of the sea-lce. In summer the sea-ice breaks up into floes, which may drift away southward and melt, or be driven hy the wind against the shore of continents or islands, leaving lanes of open water which a shift of wind may change and close in an hour. Icehergs launched from the glaciers of the land also drift with tide, current and wind through the more or less open water. Possibly at some time the pack may open and a clear waterway run through to the pole, and old whalers tell of many a year when they believed that a few days' steaming would carry them to the end of the world, if they could have seized the opportunity. At other times, routes traversed in safety time after time may be effectively closed for years, and all advance barred. Food in the form of seals or walrns in the open water, reindeer, musk-ox, polar bears or birds on the land, may often he procured, but these sources cannot be relied upon. Advance northward may be made by water in a ship, or by dog-sledge, or on foot, over the frozen snow or ice. Each method has grave drawbacks. Advance by sea is stopped when the young ice forms in autumn, and land advance is hampered by the long arctic night which enforces months of inaction, more trying to health and spirits than the severest exeition.—McClure's.

TESTING FOR ARSENIC. — In cases of medical jurisprudence it is, says *Industries and Iron*, unfortunately often necessary to test for arsenic. It was, and we fear still is, usual to use zinc to produce arseniureted hydrogen. There is great difficulty in procuring zinc absolutely pure and free from arsenic, and as the least trace of arsenic in the zinc might result in untrue evidence being given, whlch might cost the life of a human being, it seems strange that such a test should ever he used now. It ls obvious that zinc should not be employed. A small battery with platinum electrodes will produce the arseniureted hydrogen, if there is any arsenic present, without risk of any misleading results due to impurities. This method was proposed some time ago, but we believe the dangerous method with zinc is not yet superseded, owing to the conservative dread of anything new—especially anything electrical.

LARGE areas of glass at a great height above the ground, as in the roofs of large buildings, are a constant source of expense for maintenance, and a source of danger to people beneath. The *Railway Master Mechanic* suggests that the expense and dangers can be practically ohviated hy the use

of glass molded upon round steel-wire netting. The process of manufacture is such that the oettlog is imbedded in the glass, and fractnre becomes practically impossible; in any case it mnst be limited to small areas, and no broken glass can fall to the ground. This new glazing material can be bent without much difficulty, and lo this way curved skylights can readily be made. The Pennsylvania railroad will use this material in the skylight of its new passenger station at Broad street, Philadelphia.

UNDERGROUND COAL PILLARS.—The Philadelphia *Record* contains the following: An innovation which means the reclaiming of millions of tons of coal has been introduced by the Lehigh and Wilkesbarre Coal Company. The plan io brief ls to carry the culm back into the mines by means of water. This culm solidifies and holds up the surface so that the pillars of coal can be removed. These are worth many millions of dollars. The company has just contracted for an elght-inch borehole sunk over the abandoned workings of their great colllery, the Nottingham, at Plymouth. It will peoetrate to a depth of nearly 700 feet, and will then be used to flush the worked out portions of the mine with culm. It has been found that the culm thus finshed ioto the mines solidifies firmly and furnishes an adequate snpport for the strata from nndar which the coal has been removed. Under the present system only 40 to 50 per cent of coal can be taken out, the remainder being left as supports and pillars. Uoder the flushing process a new support is furnished, and new chambers and breasts can be driven around the solldlfied culm, thus making it possible to take out all bot five per cent of the entire deposit of coal as it orlglnally existed.

COAL DUST EXPLOSIONS.—Accounts come from Germany that Herr Krupp is now constrncting a number of experimental engines to test a novel idea. A German inventor has taken out letters patent coverlog the ntilization of the general principle that fioely divided carbonaceous matter floatiog in the air readily explodes. He proposes to grind coal to an impalpable powder, and, after introducing the dnst floating in the air lnto the cylinder of an engine, explode it, the idea being to follow very much the same lines which are being so thoroughly developed in the use of gas in engine practice. Natnrally, the first question which has arisen has been how to get rid of the ash. Herr Krnpp is reported to have stated that his experience in gun manufacture convinces him that this is not a serlous obstacle. The advantages which would grow out of a direct utilizatlon of mineral fuel as mined are very obvious. While modern practice converts only 10 to 15 per cent of the heat energy stored in coal into power at the crank shaft of a steam engine, it is belleved that no less than 75 to 80 per cent conld be made available by the direct combustloo of the fuel through explosion of coal dust.

SHAPE OF EGGS.—Various attempts have been made to account for the diversity in shape seen in eggs. A recent study convinces Dr. Nicolsky that the dlfferenoes may be all traced to gravity, and he finds his idea confirmed by all the eggs in the zoological collection of the St. Petersburg university. He supposes that pressure by the sides of the ovary tends to elongate the egg before the shell has hardened. In blrds which keep a vertlcal position while at rest, as do the falcoo and the owl, the soft egg is made short by the action of the weight of the body against the ovarian pressure; while in birds that, like the grebe, are nearly always swimming, the egg ls lengthened, because the bird's weight acts with the compression by the ovary. The egg is made more pointed at one end than at the other in birds that, like the guillemot, are frequently changing their position, sometimes swimmlng and diving, sometimes perching on the rocks, etc.
